language, which brought the poetry of the 'Posten' into high repute. For several years Kellgren was the most distinguished poet of Sweden with the exception of Leopold, the acknowledged head of the French school. On the institution of the Swedish Academy in 1786, the king Gustavus III., with whom Kellgren was a special favourite, named him one of the members; and he also named him his private secretary and librarian, both sinecures, with a salary which placed him at his ease. He died within two years after the king's death, on the 20th of April 1795, after two years of suffering from severe illness. His collected works, 'Samlade Skrifter,' were published in three volumes at Stockholm in 1796, and have been since reprinted. His death was at the time deplored as a national loss. Posterity has been more disposed to acquiesce in his own modest description of himself:—"There was a little man in our literary world whose talents were small: he had not perhaps what is called genius; most of his writings had little width and weight; but he had one quality perhaps in a higher degree than any of his rivals—it was a warmth, a zeal for the improvement and honour of Swedish literature, which kept to him constantly during a laborious life, and which was his last passion at the hour he wrote these lines."

Kellgren's works consist of lyric poetry, which is still in high esteem, and of four operas, of which he has only the merit of the execution, the plots having been suggested to him by King Gustavus III. Three of them are taken from the history of the Swedish royal family—'Gustavus Vasa' (1786), 'Gustavus Adolphus and Ebba Brahe' (1788), and 'Queen Christina'; the fourth is 'Æneas at Carthage.' The first, 'Gustavus Vasa,' is remarkable for the excellence of its plot, which, it has been said, belongs to the king. Kellgren was a warm admirer of Voltaire, and in consequence was led to admire the institutions of England. "I set Racine before Shakspeare," he says in the 'Stockholms Posten' for 1786, "Molière before Congreve, and the police of Paris before the police of London. I cannot therefore be considered an Anglomaniac. But what I love and venerate are the light and intelligence which pervade the mass of the nation; the quiet respect for the law, which shows that the law is good, reasonable, humane, and well for all," &c. &c. This was the first occasion, the Swedish critics tell us, on which this sort of admiration for England was expressed in Sweden.

KEMBLE, JOHN PHILIP, was born on the 1st of February 1757, at Prescot, in Lancashire. His father was Roger Kemble, an actor, and manager of a provincial company. John Kemble was not intended by his father for the stage, although during his childhood he was occasionally called upon to represent parts suitable to his age, the first upon record being, when he was just ten years old, that of the little Duke of York in Havard's tragedy of 'Charles I.,' his sister Sarah (afterwards Mrs. Siddons) acting the Princess Elizabeth. He received the rudiments of education in a preparatory school at Worcester, from whence he was sent to the Roman Catholic seminary of Sedgley Park, in Staffordshire, and afterwards to the English college at Douay, in France, where he made great progress. At the age of nineteen he returned to England, and following immediately the natural bent of his inclination towards the stage, made his appearance in the character of Theodosius in the tragedy of that name, at Wolverhampton, January 8th, 1776. Two years afterwards he was a regular member of the York company. On Tuesday, 30th of September 1783, Mr. Kemble made his first appearance in London at the Theatre Royal, Drury-Lane, in the character of Hamlet. In 1790 he became manager of that theatre. In 1803 he purchased for 24,000*l.* a sixth share in Covent-Garden Theatre from Mr. Lewis, and became manager of that establishment, having previously made a tour through France and Spain. In 1808 Covent-Garden was destroyed by fire, and on the 31st of December, at the ceremony of laying the foundation-stone of the new theatre, Mr. John Kemble's bond for 10,000*l.* was munificently cancelled by his Grace the late Duke of Northumberland. On the opening of the new theatre in 1809, under Mr. Kemble's management, an advance in the prices of admission to the pit and boxes gave rise to the well-known O.P. riots, during which the great tragedian was personally and grossly insulted whenever he appeared upon the stage. A compromise was at last made between the manager and the public, and Mr. Kemble continued to direct the entertainments at Covent-Garden in a spirit of enterprise and liberty, reviving the plays of Shakspeare with great splendour and as much propriety as was at that time perhaps within his power. On the 23rd of June 1817, he took his leave of the London audience, having previously bid farewell to that of Edinburgh (March 29th), and on the 27th of June a public dinner was given to him at the Freemason's Tavern, when Lord Holland was in the chair. Mr. Kemble, who had long suffered severely from asthma, soon afterwards retired to the south of France for the benefit of his health, and after a short visit to England on the death of his partner, the elder Mr. Harris, he finally took up his residence at Lausanne, in Switzerland, where he expired February 26th 1823, aged sixty-six. Mr. Kemble's talents, both as an actor and a manager, were of a very high order: his fine taste and classical acquirements were perceptible in every effort, and in his personation of the loftier heroes of the drama he has never been equalled. His Brutus, Coriolanus, Cato, King John, Wolsey, and Macbeth, are still fresh in the remembrance of many, and, while the recollection of them still remains, his successors to the tragic throne must, in those particular characters,

suffer by comparison. His King Lear also, as a whole, may be mentioned amongst his almost unapproachable impersonations. His very feebleness in his latter years added to the terrible truth of the picture. In society Mr. Kemble was ever the accomplished gentleman as well as the convivial companion, and to the last enjoyed the respect and regard of the noblest and most estimable in the land. Mr. Kemble's life has been written by his friend Mr. Boaden, in two vols. 8vo.

KEMBLE, CHARLES, was born on the 25th of November 1775, at Brecon (Brecknock) in South Wales. His father was Roger Kemble, an actor and theatrical manager. He was educated at the English Roman Catholic College at Douay, in the French department of Nord, whence he returned to England in 1792. He was placed, through the influence of his brother J. P. Kemble, in the General Post-Office, London, but soon resigned his situation, and after a few trials in private theatres made his first appearance on the public stage at Sheffield, as Orlando in 'As You Like It.' He had engagements afterwards at Newcastle and other towns. On the 21st of April 1794 he made his first appearance in London, as Malcolm, on the opening of the newly-built theatre of Drury Lane, John Kemble performing Macbeth, Mrs. Siddons Lady Macbeth, and Mr. Palmer Macduff. He continued for a considerable time to play secondary characters, but gradually improved in his art. On the 28th of November 1796 he performed George Barnwell at Drury Lane, Mrs. Siddons taking the character of Millwood. In 1797 he was engaged at the Haymarket Theatre, where in 1800 he brought out his adaptation of Mercier's 'Deserteur,' under the title of 'The Point of Honour,' which was performed successfully, and became a stock-play. On the 2nd of July 1806 he married Miss Marie Therese De Camp, of French parentage, but born at Vienna in 1774. Miss De Camp was engaged by her father as a danseuse at the Opera-House, London, at a very early age. Her father died when she was in her twelfth year; she was then patronised and instructed by some ladies, and had become, when Charles Kemble married her, a favourite actress in the walk of high comedy, and she so continued as Mrs. Charles Kemble till she left the stage in 1818. She died on the 3rd of September 1838. In 1807 Mr. Charles Kemble brought out with success at Covent Garden 'The Wanderer, or the Rights of Hospitality,' which is an adaptation of Kotzebue's 'Eduard in Schottland;' and in 1808, at the Haymarket, with still greater success, the farce of 'Plot and Counterplot,' an adaptation of a French piece called 'Le Portrait de Michel Cervantes.' Three or four other dramatic pieces from the German and French, which he brought out afterwards, were less successful. Meantime he continued to improve in his profession, took a wide range, and in some of his characters was without a rival. Among his best characters may be mentioned Orlando, Falconbridge, Cassio, Leon, Benedick, Young Mirabel, Mercutio, Petruccio, Archer, Ranger, Charles Surface, and Friar Tuck. For several of these characters his handsome features, fine voice, and tall well-formed athletic person, peculiarly fitted him. He closed his career as an actor on the 10th of April 1840, shortly after having been appointed to the office of Examiner of Plays. He appeared in public occasionally afterwards as a reader of Shakspeare. During some of his latter years he suffered the inconvenience of deafness. He was well acquainted with modern languages, and a tolerable classical scholar. He died on the 12th of November 1854, aged seventy-nine years within a fortnight.

Mr. Charles Kemble left one son and two daughters. His son, John Mitchell Kemble, is noticed in a separate article. His eldest daughter, *FRANCES ANNE KEMBLE, known as FANNY KEMBLE, was born about 1811, and made her first appearance as an actress at Covent Garden Theatre on the 5th of October 1829, as Juliet, on which occasion Mrs. Charles Kemble appeared again before the public as the Nurse, Charles Kemble, who was then manager, playing Romeo. She became an excellent actress, and for three years performed the principal characters in tragedy and high comedy with the greatest applause, her range including Belvidera, Isabella, Lady Macbeth, Lady Townley, Lady Teazle, Julia in the 'Hunchback,' and Louise of Savoy in 'Francis the First,' a tragedy written by herself. In 1832 she went with her father to America, where they performed in the principal cities of the United States. While in America Miss Fanny Kemble was married to Mr. Butler of Philadelphia, a man of property. The union proved an unhappy one, and in 1849 they were separated by a divorce. Meantime, in 1835, a 'Journal' of her travels and experiences in America was published in London. In 1837 she published 'The Star of Seville,' a drama, and in 1842 a volume of 'Poems.' Her latest work, entitled 'A Year of Consolation,' is an account of her residence in Italy during a visit to her sister, Mrs. Sartoris. She has since been chiefly occupied in giving public readings of Shakspeare in London, as well as in the chief provincial cities and towns of the kingdom. MISS ADELAIDE KEMBLE, Mr. Charles Kemble's other daughter, distinguished herself as an operatic singer of a very high order. She became the wife of Mr. Sartoris, a gentleman of fortune, and then quitted the stage.

The KEMBLE FAMILY form probably the most extraordinary group of actors and actresses ever known. Macklin, when nearly 100 years old, addressing John Kemble, said "Sir, I have known your family from generation to generation. I have seen you act, young man; and I have seen your father, sir; and I have seen your grandfather, sir. Sir, he was a great actor." Of the grandfather there appears to be

no record but the testimony of Macklin. The father, ROGER KEMBLE, was born on the 1st of March 1721, in the city of Hereford. He was an actor, and the manager of a company that performed in the principal towns of Wales and the west of England. He married in 1753 Sarah Ward, born September 2nd, 1735, at Clonmel in Ireland. She also was an actress. They had 12 children, of whom Mrs. Siddons and John Kemble were the two eldest. [SIDMONS, MRS. SARAH; KEMBLE, JOHN PHILIP.] Charles Kemble was the 11th child and youngest son. Roger Kemble died in 1802, and Mrs. Sarah Kemble in 1806.

STEPHEN KEMBLE (George Stephen Kemble), the third of the children, was born on the 3rd of May 1758, at Kington in Herefordshire. He was intended for the medical profession, and was placed with a surgeon at Coventry, but gave the preference to the stage. After a course of practice in the country he made his first appearance in London, at Covent Garden, on the 24th of September 1783. In the same year he married Miss Satchell, a favourite actress. After acting for some time at Covent Garden he was engaged at the Haymarket. He became afterwards the manager of a company that performed at Edinburgh and Glasgow, and subsequently of another that acted at Newcastle, Durham, Sunderland, Lancaster, and Whitehaven. He was a good actor, but became so bulky in person as to be almost unfit for any character but Falstaff, which he performed frequently, both in London and the country. His last performance was in the character of Sir Christopher Curry, in the farce of 'Inkle and Yarico,' a few days after which he was attacked by inflammation of the bowels, and died on the 5th of June 1822, at the Grove, near Durham.

FRANCES KEMBLE, the fourth child of Roger Kemble, was born on the 28th of December 1759, in the city of Hereford. She also became an actress, and performed in London; but having become the wife of Mr. Francis Twiss, quitted the stage. She died in 1812, at Bath.

ELIZABETH KEMBLE, the fifth child of Roger Kemble, was born on the 2nd of April 1761, at Warrington in Lancashire. She was apprenticed to a mantua-maker, but left that occupation for the stage. After some practice in the country, she made her first appearance in London at Drury Lane Theatre, on the 22nd of February 1783, as Portia in 'The Merchant of Venice.' After repeating Portia she repaired to York, where she had previously accepted an engagement. In face, figure, and voice she bore a striking resemblance to Mrs. Siddons. On the 21st of June 1785 she was married to Charles Edward Whitlock, an actor and joint manager of a theatrical company in the north of England known as Austin and Whitlock's company, of which Mrs. Whitlock became the principal actress. The circuit of this company embraced Newcastle, Durham, Lancaster, and Whitehaven. Cooke and Munden were members of it before they appeared in London. In 1792 Mrs. Whitlock accompanied her husband to America, where she became almost as great a favourite as Mrs. Siddons was in England. She performed mostly at Philadelphia and Charleston, and frequently before General Washington. Having acquired an independence, Mr. and Mrs. Whitlock returned to England about 1807, and quitted the stage. Mr. Whitlock died about 1820. Mrs. Whitlock was much admired in society for the liveliness of her conversation. She died on the 27th of February 1836.

The other children of Roger Kemble died young, except a daughter, Anne, born in 1764, who was alive in 1834.

*KEMBLE, JOHN MITCHELL, well known as one of the chief Anglo-Saxon scholars of his age, and also distinguished in historical literature generally, is a member of the celebrated dramatic family of the Kembles, being the son of Charles Kemble, and was born in 1807. He was educated at Trinity College, Cambridge, where he took the degree of B.A. in 1830, and that of M.A. a year or two later. From the very first his studies were directed towards the Anglo-Saxon language and literature; and in 1833 he signalised his acquirements in this department by the publication of 'The Anglo-Saxon Poems of Beowulf, the Traveller's Song, and the Battle of Finnesburgh, edited, together with a glossary and an historical preface.' The work reached a second edition in 1837, when an additional volume, containing 'A Translation of the Anglo-Saxon Poem of Beowulf, with a glossary and notes,' was appended to the first. The more important of Kemble's subsequent works are, the 'Codex Diplomaticus Ævi Saxonici, operâ Johannis M. Kemble, vol. I. 1839, vol. II. 1840; 'The Anglo-Saxon Charters; the 'Vercelli Codex: Poetry of the Codex Vercellensis, Anglo-Saxon and Latin, with an English translation,' published in 1843 as one of the works of the Ælfric Society; the 'Dialogue of Salomon and Saturnius, with an Historical Introduction and English Translation,' published in 1848 by the same society; an edition of Twyden's 'Considerations upon the Government of England,' published in 1849 by the Camden Society; and lastly, 'The Saxons in England, a History of the English Commonwealth till the period of the Norman Conquest,' published in 2 vols. in 1849. This last work comprehends the main results of Mr. Kemble's Anglo-Saxon and historical studies. For a good many years Mr. Kemble was editor of the 'British and Foreign Quarterly Review,' a periodical of the highest class, which exercised considerable political and literary influence, but ceased to exist about the year 1845. He still holds the office of Examiner of Plays under the Lord Chamberlain, his acting assistant in this office being Mr. Donne. Mr. Kemble is a Fellow of various learned societies, including the Academies of Sciences of Berlin and Munich, and the Historical Societies of Stockholm and Copenhagen.

KEMP, GEORGE MICKLE, who designed the Scott Monument at Edinburgh, was a self-educated artist, the story of whose early exertions and brief career excited great interest at the time of his death in the year 1844. He was born about the year 1794, and was the son of a shepherd of Newhall on the Esk. He was first employed in tending cattle on the Pentland hills, and it is thought that there he imbibed his attachment for the beauty of natural scenery. In his tenth, or as some say his sixth, year, being sent with a message to Roslin (six miles from his home), he saw the chapel and ruined castle there; and to this visit he was afterwards accustomed to attribute the commencement of a love of architecture—through which he was led, under much endurance, to enter upon many wanderings at home and abroad.

He was first apprenticed to a country carpenter and millwright at Red Scaur Head, near Eddlestone; and on the expiration of his time he removed to Galashiels, and subsequently visited London and Manchester, as a journeyman in his trade, in which he is said to have shown both skill and taste. Whilst at Galashiels he made excursions to Melrose and Jedburgh abbeys; and whilst in England, to which he paid two visits, he contrived to see many of the cathedrals. He acquired a great love of poetry, and especially of the works of Sir Walter Scott, and occupied himself in assiduous cultivation of his intellectual powers. In the interval of his visits to England he resided for four years in Glasgow, where he carefully studied the cathedral of that town. Thus gaining much admiration of Gothic architecture, in 1824 he started to the Continent, intending to travel over the chief part of Europe. Some embarrassments of a relative induced him to return after a twelve-month; but in the meantime he had visited the most important cathedrals of France and the Netherlands, supporting himself by his trade, in which, as an English workman in mill-machinery, his labour was highly prized. On his return to Edinburgh he attempted to set up in business, but did not succeed. He then applied himself earnestly to the practice of drawing and perspective, and about the year 1830 he produced three elaborate views of Melrose Abbey, which were purchased by Mr. Thomas Hamilton, the architect. Mr. Burn, the architect, then employed him to execute a large model for a palace for the Duke of Buccleuch, which occupied him two years. In conjunction with an engraver, and afterwards with Messrs. Blackie & Son of Glasgow, he contemplated a work on the ecclesiastical antiquities of Scotland. Considerable progress was made with the drawings and plates, the materials being collected by Kemp, who traversed great part of Scotland taking sketches and measurements. The publication was however abandoned for the time, but his labours gave him considerable knowledge of the architecture of his country. After the death of Sir Walter Scott a competition was called for of designs for a monument to his memory, when Kemp produced a design which obtained one of the three premiums of 50*l.* which were offered. A second competition followed, when Kemp, under the *nom de guerre* of "John Morvo," was again successful. Much controversy and vituperation ensued, but one of Kemp's designs was afterwards commenced. He however did not live to see it completed. On the evening of March 5, 1844, he was missing, and on the 8th his body was found in the canal, into which it was conjectured he had fallen, having had occasion to go along the towing-path on a dark night. On the 22nd his remains were followed to the grave by about 400 mourners, including the magistracy, the members of the Royal Scottish Academy, and other public bodies. He was in the fiftieth year of his age.

Kemp's career of six years after the period of his studies, and his one art-work, scarcely allow him to claim a place in the number of British architects. An impartial view of the circumstances which led to his fame, would probably show that he had happened to chime with the feeling of the moment, especially through his putting forth a design which professedly embodied details from Melrose Abbey. The Scott Monument is one of the more elaborate of those canopied and pinnacled structures covering a statue, which have since frequently been attempted, and in many details, we apprehend, with more success. Had he been employed on the execution of a design which he exhibited in a model in 1840, for the reparation and completion of the cathedral at Glasgow, he would probably have obtained higher rank in his pursuit. His life however might afford much matter of interest in inquiries, whether with reference to the scope of the artisan's calling, or the education needed for the architect.

KEMPIS, THOMAS A, born about 1350, at Kempen, near Cologne, studied at Deventer, in a religious congregation or community called "the brothers of common life," and afterwards became a regular canon of the monastery of Mount St. Agnes, of which his brother John of Kempis, was prior. He there applied himself to transcribing the Bible, the Missal, several works of St. Bernard, and other religious books. He was an excellent copyist, and very fond of that kind of occupation. He was employed fifteen years in transcribing a Bible in 4 vols. fol., which he completed in 1439. He afterwards began a collection of pious and ascetic treatises, among which were the four books 'De Imitatione Christi,' which have been erroneously ascribed to him as his own composition, but which he merely transcribed from older manuscripts. The question of the authorship of the work 'De Imitatione Christi,' which is a book of real merit, displaying a deep knowledge of the human heart, and of the world, as well as of the inward spirit of Christianity, has been often debated. It is how-

ever most generally attributed to John Gerson, chancellor of the University of Paris, and a great theologian, who died in 1429. [GERSON, J. C. DE.] It has also been attributed to a John Gerson, Abbé of Verceil, who lived in the early part of the 13th century, but this opinion, though it has been more than once revived, now finds few supporters.

Thomas à Kempis composed some ascetic treatises, such as 'Dialogus Novitiorum de Contemptu Mundi,' &c., but they are very inferior to the book 'De Imitatione J. C.' He wrote also a Chronicle of his Monastery, and other compilations. He died in 1471, at ninety years of age.

KENNET, WHITE, distinguished as a divine, antiquarian writer, and prelate of the Church of England, was born in 1669. He was the son of a Kentish clergyman; was educated at Westminster and Oxford; had the living of Ambrosden early bestowed upon him with a prebend in the church of Peterborough, but returned to Oxford, where he became vice-principal of Edmund Hall, the college to which Hearne belonged. He subsequently resigned Ambrosden, and settled in London as minister of St. Botolph's, Aldgate, where he became a very popular preacher. He was made successively archdeacon of Huntingdon and dean of Peterborough, and finally, in 1718, bishop of Peterborough. He died in 1728. Bishop Kennet was a man, as his biographer says, "of incredible diligence and application, not only in his youth, but to the very last, the whole disposal of himself being to perpetual industry and service, his chiefest recreation being variety of employment." His published works are, according to his biographer's catalogue, fifty-seven in number, including several single sermons and small tracts; but perhaps not a less striking proof of the indefatigable industry ascribed to him is to be seen in his manuscript collections, mostly in his own hand, now in the Lansdowne department of the British Museum Library of Manuscripts, where from No. 935 to 1042 are all his, and most of them containing matter not incorporated in any of his printed works.

His principal published works are: 1. 'Parochial Antiquities, attempted in the History of Ambrosden, Burcester, and other adjacent places in the counties of Oxford and Bucks,' 4to, 1695. This has been reprinted. In this work his very useful glossary is to be found. 2. 'The Case of Impropriations, &c., with an Appendix of Records and Memorials,' 1704. 3. 'A Register and Chronicle, Ecclesiastical and Civil,' in 2 volumes folio, 1728; relating to the events of a few years of the reign of King Charles II. He also published a corrected edition of 'The History of Gavelkind,' by William Somner, to which he prefixed a life of that eminent Saxonist. Most of his other works were either sermons or controversial tracts, many of the latter being on ecclesiastical controversy, in which he was reckoned what is called a Low Churchman; and having, previously to the Revolution, taken the opposite side, he was often severely handled by the other party.

There is an octavo volume, published in 1730, entitled 'The Life of the Right Reverend Dr. White Kennet, late Lord Bishop of Peterborough,' from which the above particulars have been derived. It is anonymous; and as the fact is not generally known, it may not be improper to state that the author was William Newton, rector of Wingham in Kent.

KENNICOTT, BENJAMIN, was born of humble parents, at Totnes, in Devonshire, April 4th, 1718. Being appointed master of a charity-school in his native town, he continued in this situation till 1744, when several of his friends raised a sufficient sum of money to enable him to go to Oxford. He entered at Wadham College, and applied himself with the greatest diligence to the study of divinity and Hebrew. While he was an undergraduate he published a work 'On the Tree of Life in Paradise, and on the Oblations of Cain and Abel,' which was so well received that the university allowed him to take his degree before the usual time, without the payment of the customary fees. He was elected a Fellow of Exeter College shortly afterwards, and took his degree of M.A. in 1750. He continued to reside at Oxford till the time of his death, which happened September 18th, 1783. He was a canon of Christchurch, and librarian of the Radcliffe Library, to which office he was appointed in 1767.

The most celebrated of Kennicott's works is his edition of the 'Hebrew Bible,' which was published at Oxford in 2 vols. folio, the first volume in 1776, and the second in 1780. In 1753 Dr. Kennicott published a work 'On the State of the Printed Hebrew Text of the Old Testament,' which was succeeded by another volume on the same subject in 1759. The first volume contained a comparison of 1 Chron. xi. with 2 Sam. v., xxiii., with observations on seventy Hebrew manuscripts, in which he maintained that numerous mistakes and interpolations had crept into the sacred text. In the second he gave an account of numerous other manuscripts of the Hebrew Bible, and proposed an extensive collation of Hebrew manuscripts, with the view of publishing a correct edition of the Hebrew Bible. This undertaking met with much opposition from several persons, who were afraid that such a collation might overturn the received reading of various important passages, and introduce uncertainty into the whole system of Biblical interpretation. The plan was however warmly patronised by the majority of the clergy, and nearly 10,000*l.* were subscribed to defray the expenses of the collation of the manuscripts and the publication of the work. Several learned men were employed both at home and abroad, and more than 600 Hebrew manuscripts, and 16

manuscripts of the Samaritan Pentateuch, were collated either wholly or in the more important passages. The business of collation continued from 1760 to 1769, during which period Dr. Kennicott published annually an account of the progress which was made. Though the number of various readings was found to be very great, yet they were neither so numerous nor by any means so important as those that are contained in Griesbach's edition of the New Testament. But this is easily accounted for from the revision of the Hebrew text by the Masorites in the 7th and 8th centuries, and from the scrupulous fidelity with which the Jews have transcribed the same text from that time.

"The text of Kennicott's edition was printed from that of Van der Hooght, with which the Hebrew manuscripts, by Kennicott's direction, were all collated. But as variations in the points were disregarded in the collation, the points were not added in the text. The various readings, as in the critical editions of the Greek Testament, were printed at the bottom of the page, with references to the corresponding readings of the text. In the Pentateuch the variations of the Samaritan text were printed in a column parallel to the Hebrew; and the variations observable in the Samaritan manuscripts, which differ from each other as well as the Hebrew, are likewise noted, with references to the Samaritan printed text. To this collation of manuscripts was added a collation of the most distinguished editions of the Hebrew Bible, in the same manner as Wetstein has noticed the variations observable in the principal editions of the Greek Testament. Nor did Kennicott confine his collation to manuscripts and editions. He further considered that as the quotations from the Greek Testament in the works of ecclesiastical writers afford another source of various readings, so the quotations from the Hebrew Bible in the works of Jewish writers are likewise subjects of critical inquiry. For this purpose he had recourse to the most distinguished among the Rabbinical writings, but particularly to the Talmud, the text of which is as ancient as the 3rd century." (Marsh 'Divinity Lectures,' part ii.)

Kennicott annexed to the second volume a 'Dissertatio Generalis,' in which he gives an account of the manuscripts and other authorities collated for his work, and also a history of the Hebrew text from the time of the Babylonian captivity. This dissertation was reprinted at Brunswick in 1783, under the superintendence of Professor Brunns, who had collated a great number of manuscripts for the original work.

An important Supplement to Kennicott's Hebrew Bible was published by De Rossi, under the title of 'Varia Lectiones Veteris Testamenti,' Parma, 1784-88, 4 vols. 4to; to which an appendix was added in 1798.

The works of Kennicott and De Rossi are too bulky and expensive for general use. An edition of the Hebrew Bible, containing the most important of the various readings in Kennicott's and De Rossi's volumes, was published by Doederlein and Meissner, Leip., 1793; but the text is incorrectly printed, and the paper is exceedingly bad. A far more correct and elegant edition of the Hebrew Bible, which also contains the most important of Kennicott's and De Rossi's various readings, was published by Jahn, Vienna, 1806, 4 vols. 8vo.

Two scholarships were founded at Oxford by the widow of Dr. Kennicott for the promotion of the study of the Hebrew language.

KENT, JAMES, a distinguished and deservedly popular composer of English church music, was born at Winchester in 1700, and at an early age placed as a chorister in the cathedral of that city, but soon removed to London, and admitted as one of the Children of the Chapel Royal, under the celebrated Dr. Croft, then Master of the Children. After completing his education, he was chosen organist of Finden, in Northamptonshire, and subsequently was appointed organist of Trinity College, Cambridge, whence he removed, in 1737, upon being elected to fill the same situation in the cathedral of his native place—an office which he resigned in favour of his pupil, Mr. Fussell, in 1774. He died deeply regretted in 1776.

Mr. Kent was very serviceable to Dr. Boyce while the latter was preparing his magnificent work, the 'Collection of Cathedral Music,' and his assistance is duly acknowledged by that learned editor. In 1773 he published his now well-known volume of 'Twelve Anthems,' among which are—'Hear my Prayer,' 'When the Son of Man,' 'My Song shall be of Mercy,' and others familiar to and the delight of the congregations of our cathedrals. Upon presenting a copy of this work to Trinity College, the Master and Fellows voted him a valuable piece of plate. After his decease, a 'Morning and Evening Service, and Eight Anthems,' composed by him for the Winchester choir, were collected and printed by Mr. Corfe of Salisbury; but the probability is that the author never intended them for publication, for only the service and one of the anthems admit of comparison with the productions he himself gave to the world. He was regarded by his contemporaries as one of the ablest players on the organ of his time.

KENT, JAMES, one of the most distinguished lawyers of America, was born at Fredericksburg, in the state of New York, on the 31st of July 1763. After passing through Yale College with great credit, he studied law under Mr. Benson, attorney-general for the state of New York; was admitted to practise as attorney of the supreme court of that state in 1785, and in 1787 as counsellor. During this time he had been prosecuting with exemplary diligence not only legal but

general studies, and he began early to be regarded as one of the most promising of the rising public men as well as lawyers of his day. From 1790 to 1794 he sat in the state legislature, but failing in securing his re-election, he seems, about the latter year, to have withdrawn from politics, and to have devoted himself to the more profound study of the principles of jurisprudence. Elected professor of law in Columbia College, he, in 1794, left Poughkeepsie, where he had hitherto lived, for New York, in which city he continued to reside during the remainder of his life. In 1796 he was appointed master in chancery, and in 1797 recorder of New York and associate-justice of the supreme court. Honours of various kinds were now being liberally bestowed upon him. "In recognition of his great legal learning," the faculty of Columbia College bestowed upon their professor the degree of LL.D.; and a similar honour was subsequently conferred by Harvard and Dartmouth colleges. In 1800 he was appointed, with Judge Radcliffe, to revise the legal code of New York—a work of some labour, and requiring great judgment, but one which was so executed as to obtain general approbation. In 1804 Mr. Kent was made chief-justice of New York, an office he held for nearly ten years with the highest credit. He then accepted the still more elevated post of chancellor, which he continued to occupy till the 1st of August 1823, when he became disqualified by the clause in the state constitution, which provided that no person shall hold the office of chancellor or judge beyond the age of sixty. Though thus superannuated, Chancellor Kent was far from thinking of repose. He had been for five-and-twenty years a judge at law and in equity, and having been during that time constantly employed in his judicial duties, he says in the preface to his 'Commentaries,' he was "apprehensive that the sudden cessation of his habitual employment, and the contrast between the discussions of the forum, and the solitude of retirement, might be unpropitious to his health and spirits, and cast a premature shade over the happiness of declining years." He therefore once more very willingly accepted the appointment of professor of law in Columbia College; and he now brought to bear upon his teaching the results of his long and very important judicial experience. Happily for the legal student he was induced to embody the substance of his lectures, and his observation of the workings of the law he had so long administered, in an elaborate work entitled 'Commentaries on American Law,' 4 vols. 8vo, 1826-30. This work was at once received throughout the United States as a text-book, and speedily obtained general acceptance in this country as a standard work on the constitutional law of America, and time has amply confirmed the first favourable impression. Retaining almost to the last his remarkable physical strength and mental activity, Chancellor Kent survived till the 12th of December 1847, when he died, amidst the general regrets of his fellow-citizens, in his eighty-fourth year. He was a man of cheerful temperament, of methodical habits, great industry, and thorough integrity. In private life he was esteemed in no ordinary degree; while as a judge his decisions have been pronounced by the courts of America to be of the highest authority; and as an authority on constitutional law he ranks alongside of his great countrymen, Story and Marshall.

KENT, WILLIAM, an artist of moderate ability as a painter and sculptor, but one of some ability and considerable influence as an architect and landscape gardener, was born in Yorkshire in 1684. Both his parentage and education were humble, and he was apprenticed to a coach-painter. Conceiving however that he had abilities which ought to elevate him above that grade, he attempted to establish himself as a portrait and historical painter, and so far attracted notice that some gentlemen raised a contribution for the purpose of enabling him to go and study in Italy. Thither he accordingly proceeded in 1710, and remained there several years; and there, in 1716, he had the good fortune to win the notice and patronage of the Earl of Burlington, who not only brought home his protégé, and exerted all his influence and authority in matters of taste to recommend him to others, but took him under his own roof, where he remained till his death, April 12, 1748. How far Kent assisted his patron in his designs, or the latter assisted him, is doubtful; but it is certain that he soon discovered greater capacity for architecture than he had done for painting. The designs for Holkham, the seat of the Earl of Leicester, Norfolk, are said to have emanated principally, if not entirely, from him; and if so, that edifice proves him to have possessed both talent and taste as an architect, it being excellent in plan, and possessing many beauties of design. But his greatest skill lay in landscape-gardening; in which art he is regarded as the father of the English style. Walpole, who is sometimes as lavish as he is at others niggard of praise, says that Kent was "painter enough to taste the charms of landscape, bold and opinionative enough to dare and to dictate, and born with a genius to strike out a great system from the twilight of imperfect essays." Shakspeare's monument in Westminster Abbey will preserve his name as a sculptor, without however adding to his reputation.

KENYON, LLOYD, LORD, the second son of Lloyd Kenyon, Esq., by Jane, daughter of Robert Eddowes of Eagle Hall in Cheshire, was born at Gredington in Flintshire, on the 5th of October 1732. He was descended from an ancient family in Lancashire, which had migrated into North Wales at the commencement of the last century. His father lived independently as a country gentleman, and belonged to the commission of the peace for his county. The education of the

future chief-justice was however, from the straitened means of the parent, very defective. He was sent early to the grammar school at Ruthin, but was taken away before he had time to do more than acquire a little Latin. At the age of fourteen he was articled to Mr. Tomlinson, an attorney in large practice at Nantwich in Cheshire, with whom he remained for seven years, during which time his diligence and shrewdness procured him so much of his master's favour that he expected, at the end of his clerkship, to be taken into partnership. In this expectation he was however disappointed, and thereupon determined upon being called to the bar. In 1754 he took chambers at the Temple, and became a member of Lincoln's Inn. While a student he devoted himself with great earnestness to the law, and to the law only; and in doing this he made smaller sacrifices than most people. He had neither a literary taste nor a love of pleasure; and his pecuniary resources were but scanty.

Mr. Kenyon was called to the bar in Hilary Term, 1761, but in consequence of the want of a professional connection, and being of a character too honourable and independent to stoop to little artifices, many years elapsed before he obtained business. Still he laboured patiently and unceasingly, frequenting the courts both of common law and equity, but more especially the latter, and attending both circuit and sessions. His attainments in all departments appear to have been not only considerable, but exact, and he acquired by degrees the reputation of being a sound lawyer, and a neat and safe equity draftsman and conveyancer. It is stated, that having by some suggestions, as *amicus curiæ*, attracted the notice of Mr. Thurlow, the then attorney-general, he had the offer made to him of sharing with Mr. Hargrave in the toil and profit of assisting him. In 1773, when he had been twelve years in the profession, he married Mary, third daughter of George Kenyon of Peele in Lancashire. He now began to rise into notice. In 1779 he was retained as one of the council for Lord Pigot in the state prosecution of Shelton and others for depriving him of his government; and afterwards in the same year as leading counsel for Lord George Gordon. In April 1782, on the accession of the Fox and Rockingham administration, he was appointed attorney-general. While holding this situation his conduct evinced that official intrigue and partisanship were not at all suited to his character. On the death of the Marquis of Rockingham he retained his office with Pitt as chancellor of the exchequer, and went out with the Shelburne administration in the spring of the year following. In December he was reappointed attorney-general, having through all the ministerial changes of the day asserted his independence. To the character of an orator he had no pretension, being a man of little imagination, and expressing himself not only without elegance, but occasionally with vulgarity. He was no scholar, and yet he would insert Latin words and phrases without point or taste in his discourses.

In 1784 he was raised to the office of Master of the Rolls, and created a baronet; and in May 1788 he was gazetted Lord Kenyon, Baron Gredington, and succeeded Lord Mansfield as Chief-Justice of the King's Bench. His appointment to this important and dignified situation was at the time unpopular with the profession generally. To the opinion of his brother judges he gave a reception not only of neglect, but almost of contempt; and whenever they ventured to differ from him (which only took place some half dozen times in fourteen years), he exhibited the same feelings which another person would do upon receiving a personal affront. To the barristers, both leaders and juniors, he was equally ungracious; and whenever anything escaped them not in accordance with his sentiments, he castigated them in terms neither measured nor in character with the situation which he filled. To some leading men he would take a personal dislike, and allow no opportunity for mortifying them to escape him; Mr. Law, afterwards Lord Ellenborough, was one of them.

With the press Lord Kenyon was in high favour; for he struck sternly and with indignation at those offenders who are the peculiar objects of popular dislike. But while doing so he frequently gave too easy credit to accusation, and allowed himself to punish often with a severity not sufficiently tempered. The vices of the wealthy, and those which affected the domestic relations, met with no favour from him. Against gambling he set himself with the utmost sternness; he even threatened that if any prosecutions were fairly brought before him, and the guilty parties convicted, whatever might be their rank or station in the country, though they were the first ladies in the land, they should certainly exhibit themselves in the pillory. As a judge, he recognised no distinction between the gamblers of St. James's and the pickpockets of the Strand. Lord Kenyon exerted himself to the utmost to put an end to duelling, and he declared that whoever was convicted of having murdered his fellow-creature in a duel should suffer the course of the law; and he on more than one occasion directed the jury to that conclusion, but without success. Flagitious libels against individuals were punished by him with merited severity.

But of all writings, those partaking of the character of political libels were those against which he directed, with the most unflinching perseverance, all the terrors of the law. This was a more dangerous and delicate ground to tread upon, and his conduct will probably find few approvers now. Certain it is, that since the time of Lord Kenyon the practice of prosecuting for political libels has gradually fallen into disuse; nor would the pillory, as part of the punishment for

putting forth opinions, however mischievous or absurd, be at this time tolerated.

Lord Kenyon trusted too much to the power of the terrors of the law in guarding the rights of property from fraud or violence; and he inflicted death as the most terrible and therefore the most preventive punishment. That this proceeded rather from a mistaken judgment—an ignorance of, or a want of power to give sufficient weight to, those circumstances which exert a more powerful influence upon human character, and not from a cold and sanguinary disposition—the following anecdote may be considered as a proof:—He passed sentence of death upon a young woman who had committed a theft; she fainted. Lord Kenyon, in great agitation, cried out, "I don't mean to hang you; will nobody tell her that I don't mean to hang her?"

Indeed, in behalf of poor and ignorant offenders who were the dupes or tools of knaves his kindly feelings were often displayed, and humble individuals of the working classes who were harassed by informers were sure to be shielded by him. A prosecution was commenced against a man for practising the trade of a tailor without having served an apprenticeship, and an attempt was made to punish him for several acts done in the same day. "Prosecute the man," said Lord Kenyon, "for different acts in one day! Why not sue for penalties on every stitch?"

Lord Mansfield, when chief-justice, had somewhat unsettled the bounds of the courts of law; but Lord Kenyon, with much wisdom, reverted to the ancient strictness, and he expressed his determination to maintain it. He wisely refused to allow the plain words of a statute to be refined away, however severe in its enactments, by any subtle sophistry. "The arguments," he said, "that have been pressed upon us might have had some effect if they were addressed to the legislature; but we are sitting in a court of law, and must administer justice according to the known laws of the land. Let application be made to the legislature to amend the act: as long as it remains upon the statute-book we must enforce it."

At Nisi Prius he never brought a book with him into court to refer to. The extent as well as the arrangement of his legal knowledge needed no such assistance. In performing the laborious duties of his profession he was diligent and exact, and proceeded with so much expedition as often to get through twenty-five or twenty-six causes to the entire satisfaction of the court. His adjudications, though occasionally objected to at the time, are now regarded as of the highest authority.

He died in 1802, sorrow-stricken by the loss of his eldest son, after having accumulated a fortune of 300,000*l*.

In his private habits Lord Kenyon was temperate, frugal even to parsimony, and an early riser. For his happiness he looked to his home, being most deeply attached to his family. He entirely disregarded outward appearance; his dress was shabby, his equipage mean, while he entirely neglected to exercise the hospitality becoming his high station and large fortune.

(*Law Magazine*, No. 37, p. 49.)

KEPLER, JOHN, was born at Weil in the duchy of Würtemberg, 21st of December 1571. He was a seven-months child, very weak and sickly, and survived with difficulty a severe attack of smallpox. His parents, Henry Kepler and Catherine Guldenmann, were of noble descent, although their circumstances were far from affluent. The father, at the time of his marriage, was a petty officer in the service of the Duke of Würtemberg, and joined the army in the Netherlands a few years after the birth of his eldest son John. Upon his return to Germany he learnt that an acquaintance for whom he had incautiously become security had absconded, and had left him the unexpected charge of liquidating the bond. This circumstance obliged him to dispose of his house and nearly the whole of his possessions, and to become a tavern-keeper at Elmendingen. Young Kepler had been sent in the year 1577 to a school at Elmendingen, and he continued there until the occurrence of the event to which we have just alluded, and which was the cause of a temporary interruption in his education, as it appears that he was taken home and employed in menial services until his twelfth year, when he returned to school. In 1586 he was admitted into the monastic school of Maulbronn, where the cost of his education was defrayed by the Duke of Würtemberg. The regulations of this school required that after remaining a year in the superior classes the students should offer themselves for examination at the college of Tübingen for the degree of Bachelor. On obtaining this degree they returned with the title of veterans; and having completed the prescribed course of study, they were admitted as resident students at Tübingen, whence they proceeded in about a year to the degree of Master. During his undergraduate studies Kepler's studies were much interrupted by periodical returns of the disorders which had so nearly proved fatal to him during childhood, as also by the dissensions between his parents, in consequence of which his father left his home, and soon after died abroad. Notwithstanding the many disadvantages he must have laboured under from the above circumstances, and from the confused state in which they had left his domestic affairs, Kepler took the degree of Master in August 1591, attaining the second place in the annual examination. The first name on the list was John Hippolytus Brentius.

While thus engaged at Tübingen, the astronomical lectureship of

Grätz, the chief town in Styria, became vacant by the death of George Stadt, and the situation was offered to Kepler, who was forced to accept it by the authority of his tutors, although we have his own assurance that at that period he had given no particular attention to astronomy. This must have been in the year 1593-94. In 1596 he published his 'Mysterium Cosmographicum,' wherein he details the many ingenious hypotheses which he had successively formed, examined, and rejected, concerning the number, distance, and periodic times of the planets; and finally, proposes a theory which he imagines will account in a satisfactory manner for the order of the heavenly bodies, which theory rests upon the fancied analogy between the relative dimensions of the orbits of those bodies, and the diameters of circles inscribed and circumscribed about the five regular solids. In 1597 Kepler married Barbara Muller von Muhleckh, a lady who, although two years younger than himself, was already a widow for the second time. This alliance soon involved him in difficulties, which together with the troubled state of the province of Styria, arising out of the two great religious parties into which the empire was then divided, induced him to withdraw from Grätz into Hungary, whence he transmitted to a friend at Tübingen, several short treatises—'On the Magnet,' 'On the Cause of the Obliquity of the Ecliptic,' and 'On the Divine Wisdom as shown in the Creation.' In 1600 Kepler, having learned that Tycho Brahé was at Benach in Bohemia, and that his observations had led him to a more accurate determination of the eccentricities of the planets' orbits, determined on paying him a visit, and was welcomed in the kindest manner by Tycho, by whom he was introduced the following year to the emperor, and honoured with the title of imperial mathematician, on condition of assisting Tycho in his calculations. Upon the death of Tycho, which happened in the month of October of the same year, Kepler succeeded him as principal mathematician to the emperor. To this great man Kepler was under many obligations, not merely for the pecuniary assistance and hospitality which himself and family so often experienced from Tycho, and upon which at one period they entirely depended for subsistence, but still more for the sound advice which he gave him, to abandon speculation, and to apply himself to the deduction of causes from their observed effects,—advice which Kepler greatly needed, and to which, if he had adhered more closely, his fame would have been even greater than what it now is. It is to be regretted that upon several occasions the conduct of Kepler towards Tycho Brahé ill-accorded with the generosity of the latter, though this appears to be attributable rather to the impetuosity of Kepler's temper, than to any want of gratitude towards his benefactor. It has been said that Kepler was appointed imperial mathematician on condition of assisting Tycho in his calculations. The object of these calculations was the formation of new astronomical tables generally, which were to be called the Rudolphine Tables, in honour of Rudolph the then emperor of Bohemia, who had promised, not merely to defray the expense of their construction, but likewise to provide Kepler with a liberal salary; neither of which his circumstances ever permitted him to fulfil. The part more particularly allotted to Kepler was the reduction of Tycho's observations relative to the planet Mars, and to this circumstance is mainly owing his grand discovery of the law of elliptic orbits, and that of the equable description of areas. The pecuniary difficulties however in which he found himself almost incessantly involved in consequence of the non-payment of his salary, greatly retarded the progress of his labours, and obliged him to seek a livelihood by casting nativities. The Rudolphine Tables were therefore postponed, and he applied himself to works of a less costly character, from which he might expect to derive more immediate remuneration. In 1602 appeared his 'Fundamental Principles of Astrology;' in 1604 his 'Supplement to Vitellion;' in 1605 'A Letter concerning the Solar Eclipse;' and in 1606 'An Account of the New Star which had appeared in 1604 in the Constellation Cassiopeia.' Of these the 'Supplement to Vitellion' was important, as containing the first consistent theory of that branch of optics termed dioptries.

At length, in 1609 appeared his 'New Astronomy,' containing his great and extraordinary book 'On the Motion of Mars;' a work which holds the intermediate place, and is the connecting link, between the discoveries of Copernicus and those of Newton. The introduction is occupied in refuting the then commonly-received theory of gravity, and in declaring what were his own opinions upon the same subject. In the course of this discussion he states distinctly that since the attractive virtue of the moon extends as far as the earth, as is evident from its enticing up the waters of the earth, with greater reason it follows that the attractive virtue of the earth extends as far as the moon, and much farther; and he likewise asserts that if two bodies of like nature be placed in any part of the world near each other, but beyond the influence of any other body, they would approach each other like two magnets, each passing over a space reciprocally in proportion to its mass; so that if the moon and earth were not retained in their orbits by their animal force, or some other equivalent to it, the earth would approach the moon by the 54th part of their distance, and the moon would approach the earth by the remaining 53 parts. Previous to the publication of this remarkable work it was supposed that each planet moved uniformly in a small circle called an epicycle, the centre of which epicycle moved with an equal angular velocity in

the opposite direction round the centre of the earth, thus describing a larger circle which was called the deferent. Subsequent observations being found irreconcilable with the foregoing hypothesis, it was modified by supposing the uniform angular motion of the epicycle to be described about a point not coinciding with the centre of the earth, a necessary consequence of which supposition was that the linear motion of the epicycle ceased to be uniform. The work of Copernicus 'De Revolutionibus Orbium Cælestium' had appeared in 1543, wherein he considers the sun to be the fixed centre about which the planets move with uniform motions, but retains the complicated machinery of the deferent and epicycle in order to account for the variations arising from the actual inequality of the planet's motion. The system of Tycho Brahe himself was identical with one which Copernicus had rejected, and consisted in supposing the sun to revolve about the earth, carrying with it all the other planets revolving about him; and indeed Tycho not only denied the revolution of the earth about the sun, but likewise its diurnal rotation upon its axis. Such is an imperfect outline of the theory of the universe before the time of Kepler. The theory adopted by Kepler in the early part of his discussion of Tycho's observations, appears to have been that the orbit of each planet, including the earth, was circular; that it was described with a uniform angular velocity about a point within, called the centre of the equant, and that the centre of the orbit lay in the line joining the centre of the equant and the place of the sun, but not equidistant between those points, as had been previously supposed. With respect to the earth however, in particular, he had started with the erroneous opinion, then generally entertained by all astronomers, that the centre of the earth's equant coincided with that of its orbit, and that consequently not only its angular but also its linear motion was uniform, although its distance from the sun was known to vary. After four years of laborious calculation, the non-accordance of his results with observation obliged him to fix upon the bisection of the line joining the centre of the equant and the place of the sun, for the centre of the planet's orbit; and shortly after he was led to the conclusion that one of the two other principles upon which his theory rested must be erroneous; that either the orbit of the planet was not a perfect circle, or that there was no point within it round which it moved with a uniform velocity.

Having easily proved that at the apsides, that is, the two points of the planet's orbit which are nearest to and farthest from the sun, the times of describing equal small arcs are nearly proportional to the distances of the planet from the sun, he concluded with his accustomed precipitancy that the same relation existed at all other points of the orbit. An almost immediate consequence of this assumption was that the time of describing an arc of any length whatever would be proportional to the sum of all the lines which could be drawn from the sun to every point of that arc; but as the calculation of these distances was found to be excessively operose, he substituted the approximate area of the figure bounded by the arc and the two extreme distances for the sum of all the distances, and was thus led from erroneous principles to that beautiful law of the planetary motions by which the area described by the revolving radius vector is proportional to the time of its description. When however he came to apply this theory to the motion of Mars, the eccentricity of whose orbit is much greater than that of the Earth's, he found that the circular hypothesis gave results differing from the observations of Tycho by at least eight minutes; and as he considered that difference too great to be attributed to the error of so exact an observer, he concluded that the suspicions which, as was above stated, he had long previously entertained relative to the form of the planets' orbits, were well founded, at least with respect to the planet Mars. At length he deduced, from observations of that planet near the quadratures, that its orbit was an oval elongated in the direction of its apsides, and was thus led to the law of elliptic motions.

The elliptic form of the orbits, and the equable description of areas, constitute two of the three celebrated truths known by the name of Kepler's laws. The third, namely, that the squares of the periodic times are proportional to the cubes of the mean distances from the sun, was not discovered till twelve years after, although, before the publication of his 'Mysterium Cosmographicum,' he had been speculating, as we have seen, upon finding some relation between those distances and periodic times. The final discovery resulted, far less from philosophical deduction than from the innumerable combinations which his ever-active fancy had been calling into existence during the previous seventeen years; and indeed when he at length detected the relation which he had so long been in search of, he was only able to offer an explanation of it upon four suppositions, three of which are now known to be false.

In 1620 Kepler was visited by Sir Henry Wotton, the English ambassador at Venice, who finding him, as he was always to be found, oppressed with pecuniary difficulties, urged him to go over to England, where he assured him of a welcome and honourable reception; but Kepler could never determine on quitting the Continent. In 1624 he went to Vienna, where with difficulty he obtained 6000 florins towards completing the Rudolphine Tables, together with commendatory letters to the states of Suabia, from whom he also collected some money due to the emperor. It was not however till 1627 that these tables—the first that were calculated on the supposition that the planets move

in elliptic orbits—made their appearance; and it will be sufficient to say of them, in this place, that had Kepler done nothing in the course of his whole life but construct these, he would have well earned the title of a most useful and indefatigable calculator. In 1630 he made a final attempt to obtain a liquidation of his claims upon the imperial treasury, but the fatigue and vexation of his fruitless journey brought on a fever which terminated his life in the early part of November 1630, and in his fifty-ninth year. His body was interred in St. Peter's churchyard at Ratisbon, and a simple inscription, which has long since disappeared, was placed on his tombstone. Upon the character of Kepler, upon his failures, and on his success, Delambre has pronounced the following judgment:—"Ardent, restless, burning to distinguish himself by his discoveries, he attempted everything; and having once obtained a glimpse, no labour was too hard for him in following or verifying it. All his attempts had not the same success, and in fact that was impossible. Those which have failed seem to us only fanciful; those which have been more fortunate appear sublime. When in search of that which really existed, he has sometimes found it; when he devoted himself to the pursuit of a chimera, he could not but fail; but even there he unfolded the same qualities, and that obstinate perseverance that must triumph over all difficulties but those which are insurmountable."

The following is a list of Kepler's published works. His manuscripts were purchased for the library of St. Petersburg, where Euler, Lexell, and Kraft undertook to examine them, and to select the most interesting parts for publication; but the result of this examination has never appeared.

List of Kepler's published works:—"Ein Calender," Gratz, 1594; 'Prodromus Dissertat. Cosmograph.', 4to, Tübingen, 1596; 'De Fundamentis Astrologiæ,' 4to, Prague, 1602; 'Paralipomena ad Vitellionem,' 4to, Francofurti, 1604; 'Epistola de Solis deliquio,' 1605; 'De Stellâ Novâ,' 4to, Prague, 1606; 'Vom Kometen,' 4to, Halle, 1608; 'Antwort an Rösliu,' 4to, Prague, 1609; 'Astronomia Nova,' fol., Prague, 1609; 'Tertius Interveniens,' 4to, Frankfurt, 1610; 'Dissertatio cum Nuncio Sidereo,' 4to, Francofurti, 1610; 'Strena, seu De nive sexangulâ,' 4to, Frankfurt, 1611; 'Dioptrica,' 4to, Francofurti, 1611; 'Vom Geburten Jahre des Heylandes,' 4to, Strasburg, 1613; 'Respons. ad epist. S. Calvisii,' 4to, Francofurti, 1614; 'Eclogæ Chroniæ,' 4to, Frankfurt, 1615; 'Nova Stereometria,' 4to, Lincii, 1615; 'Ephemerides 1617-1620,' 4to, Lincii, 1616; 'Epitomes Astron. Copern. Libri i. ii. iii.,' 8vo, Lentiis, 1618; 'De Cometis,' Aug. Vindelic., 4to, 1619; 'Harmonice Mundi,' fol., Lincii, 1619; 'Kanones Pueriles,' Ulmæ, 1620; 'Epitomes Astron. Copern. Liber iv.,' 8vo, Lentiis, 1622; 'Epitomes Astron. Copern. Libri v. vi. vii.,' 8vo, Francofurti, 1622; 'Discurs von der grossen Conjunction,' 4to, Linz., 1623; 'Chilias Logarithmorum,' fol., Marburgi, 1624; 'Supplementum,' 4to, Lentiis, 1625; 'Hyperaspistes,' 8vo, Francofurti, 1625; 'Tabulæ Rudolphinæ,' fol., Ulmæ, 1627; 'Resp. ad epist. J. Bartschii,' 4to, Sagani, 1629; 'De anni 1631 Phænomenis,' 4to, Lipsæ, 1629; 'Terrentii Epistolium cum Commentationuncula,' 4to, Sagani, 1630; 'Ephemerides,' 4to, Sagani, 1630; 'Somnium,' 4to, Francofurti, 1634; 'Tabulæ Manuales,' 12mo, Argentorati, 1700.

A splendid edition of Kepler's 'Correspondence' was published under the auspices of the Emperor Charles VI., in 1718, by M. G. Hansch. It is entitled 'Epistolæ ad J. Keplerum,' &c., and the title-page has no place of publication, but the preface is dated from Leipzig. It contains a life of Kepler.

*KEY, THOMAS HEWITT, was born in Southwark, March 20, 1799, the son of Dr. Key, a medical practitioner in London. His father was married twice—his only son by his first wife (a relative of Sir Charles Barry) being the late eminent surgeon C. Aston Key; and his youngest son by his second (a sister of the former wife) being the subject of this notice. After receiving his school-education at Buntingford Grammar-school in Hertfordshire—a school founded by Seth Ward—Mr. Key passed to St. John's College, Cambridge, in October 1817, and was elected a scholar of this college in the following month. In the spring of 1819 he exchanged St. John's for Trinity College in the same university; of which he was also elected a scholar. In 1821 he took his degree of B.A., obtaining a place in the list of Wranglers—there being then no classical tripos. Residing in Cambridge two years as B.A. he studied medicine; and in 1823-4 he continued his medical studies at Guy's Hospital, London. In 1824 however after taking his M.A. degree, he made the acquaintance of Mr. Gilmore, an American gentleman, at that time on a visit to Europe with a commission to fill up certain professorships in the university of Virginia, then just founded under the rectorship of the ex-president Jefferson, with the ex-presidents Madison and Monroe, and others, as his coadjutors. The consequence was that Mr. Key accepted the professorship of Pure Mathematics in that University. The duties of this office he discharged for three sessions; but the climate of Virginia not agreeing with his health, he returned to England in 1827. During his residence in America he had applied his leisure to the study of the Latin language in its deeper philological relations; and some of his new conclusions on this subject having become known to Mr. George Long, his colleague in the Virginian University as Professor of Greek and Latin, he was, chiefly at the instance of Mr. Long, elected in the autumn of 1828, to fill the Latin chair in the University of London, then on the point of opening. This chair he

held for thirteen years; during which time he contributed articles in his favourite department of philology to the 'Journal of Education,' established by the Society for the Diffusion of Useful Knowledge. To the first number of this journal he contributed a review of Zumpt's 'Latin Grammar,' advancing views which he subsequently developed more systematically in his own 'Latin Grammar,' published in parts between 1843 and 1846. On the opening of a Junior School in connection with University College in 1833, Mr. Key and his colleague Mr. Malden were appointed joint head-masters, an arrangement which continued till 1842, when Mr. Key gave up his latin professorship in the College, and became sole head-master of the school, associating with this office that of Professor of Comparative Grammar in the college. Both of these offices he still (1856) holds.

Mr. Key's high reputation among British philologists depends on his numerous writings, the chief of which are as follows: articles on subjects connected with Latin literature, contributed to the first four volumes of the Useful Knowledge Society's 'Journal of Education;' various articles in the 'Penny Cyclopaedia,' including that on the 'Alphabet;' papers in the 'Proceedings of the Philological Society' (vols. ii.-vi.), and also in the Transactions of the same society (vols. i.-iii.); thirteen papers on Latin Etymology signed "Claudius," in Bell's 'English Journal of Education,' from July 1850 to September 1851; two papers on the "crude-form" method of teaching the classical languages, published in the same journal, December 1850 and February 1851; a few articles in the 'Dictionary of Classical Antiquities,' edited by Dr. Smith; and finally, his 'Latin Grammar,' published complete in 1846. In the autumn of 1844 Mr. Key engaged in a controversy with the Rev. J. W. Donaldson, respecting that gentleman's work, entitled 'Varronianus;' and the five pamphlets which he then published were reprinted for private circulation. Mr. Key also contributed an article on 'Latin Dictionaries' to the 'Westminster Review' in July 1856.

Of these numerous philological writings the most important, after his 'Latin Grammar,' are perhaps those in which he expounds the metres of Terence ('Quart. Journ. of Ed.,' vol. ii.), the claims of the Finn and Lapp languages to admission into the Indo-European family ('Proc. of Phil. Soc.,' vol. ii.), and his ('Proc. of Phil. Soc.,' theories of the demonstrative pronouns, of the substantive verb, of the middle or passive voice, and of the irregularities seen in such forms as 'Good, Better, Best'—to which may be added his paper on the representatives of the Greek preposition *ava* in kindred languages. ('Trans. of Phil. Soc.,' vol. i.) A 'Latin-English Dictionary,' on which he has been engaged for ten years, and which will necessarily be the most important of his works, is still, we believe, in course of preparation.

Mr. Key married in 1824 the daughter of Richard Troward, Esq., the solicitor who conducted the prosecution against Warren Hastings. One of his daughters is married to his colleague, Dr. Williamson, Professor of Chemistry in University College.

KHEMNITZER, IVAN IVANOVITCH, an admired Russian fabulist, was born in 1744, at St. Petersburg, where his father, who was a native of Saxony, held the appointment of physician at one of the hospitals. His aversion to medical and anatomical studies determined him to enter the army in preference to following the profession chosen for him; but after serving in two campaigns against the Prussians and Turks, he served only as a military engineer, in which capacity he quickly won the regard of his superiors. In 1784 he was appointed consul-general at Smyrna, but had hardly arrived there when he died (March 20th). Although his Fables reached a second edition in his lifetime, they did not attract much notice until a complete edition of all his pieces appeared in 3 vols. in 1799, with a memoir of the author and his name, which last had not been previously given to the public. Since then they have been reprinted several times, and have acquired great popularity.

KHERASKOV, MICHAEL MATVIEVITCH, born on the 25th of October 1733, was a Russian poet of considerable celebrity in the last century, although his reputation has since declined. His epic poem in twelve cantos, entitled the 'Rossiada,' which first appeared in 1785, celebrates the liberation of Russia from the yoke of the Tartars in the reign of Ivan Vassilievitch. Although hardly rising to the dignity of an epic, this production possesses much interest of narrative, and several very striking scenes and descriptions. 'Vladimir,' his second poem of the same class, is in eighteen cantos, and was first published in 1786. Besides these he wrote numerous other works, both in prose and verse, including an imitation of Corneille's 'Cid,' and some other tragedies and dramatic pieces. He died on the 27th of September 1807.

KHOSRU I., called CHOSROES by the Greek writers, but more commonly known in the east by the name of NUSHIRWAN ('noble soul'), succeeded his father Kobad in the kingdom of Persia, A.D. 531. Kobad, at the time of his death, was engaged in a war with Justinian, the emperor of Constantinople; but Khosru, shortly after his accession, concluded a peace with Justinian, on the payment by the latter of 10,000 pounds of gold. Khosru diligently employed this interval of rest in regulating the internal affairs of his kingdom; the corrupt officers and magistrates, who had been appointed during the reign of his father, were removed; justice was impartially administered in every part of the empire; and the fanatical followers of Mazdak, who had obtained numerous proselytes to the inviting doctrine of a com-

munity of goods and women, were banished from his dominions. He divided the empire into the four great provinces of Assyria, Media, Persia, and Bactriana, and established a vizir over each; and he secured at the same time the stability of his throne by the murder of his two elder brothers. In the course of a few years he extended his dominions as far as the Indus, and compelled the nomadic hordes, who had taken possession of the northern provinces of the empire during the reign of his father, to repossess the Oxus and withdraw to the central plains of Asia.

Though Khosru was successful in his wars with the people of Asia, he beheld with concern the conquests of Belisarius in Italy and Africa; and afraid lest Justinian should acquire sufficient power to attack the Persian dominions, he collected a large army, and, in violation of the truce that still subsisted, he invaded Syria in 540. His unexpected attack had given the Greeks no time for defence; the principal cities were plundered by the Persian troops, and Antioch, the capital, was taken after a short but vigorous resistance. On his return, Khosru founded, at one day's journey from Ctesiphon, a city, which he called Antioch Khosru, where he placed the numerous captives he had taken in his invasion of Syria. In the following year Belisarius was recalled to defend the east; and his superior military skill enabled him, with an army far inferior to the Persians both in discipline and numbers, to prevent Khosru from extending his conquests. In 542 Belisarius was recalled to Constantinople, and degraded from all his employments; and the generals who succeeded him were easily defeated by the Persian troops. The war continued to be carried on for many years, though with little vigour on either side, in the neighbourhood of the Black Sea, and principally in the territories of the Lagi, a Colchian people; till at length, after much delay and many negotiations, Khosru condescended to grant a peace to Justinian in 562, on the annual payment by the latter of 30,000 pieces of gold.

This peace however was only preserved for ten years. The lieutenants of Khosru had subdued the province of Yemen in Arabia, and compelled the Abyssinians, who had possessed the supreme authority for many years, to withdraw from the country. The Abyssinians were the allies of the emperors of Constantinople; and Justin, who had succeeded Justinian, having entered into an alliance with the Turks, collected a powerful army in order to avenge the cause of his allies. But his efforts were unsuccessful; his troops were everywhere defeated, and the province of Syria was again plundered by the Persian soldiers. Justin was obliged to resign the sovereignty, and his successor Tiberius obtained a truce of three years, which time was diligently employed by Tiberius in collecting an immense army from all parts of the empire. The command was given to Justinian, and a desperate battle was fought between the Greeks and Persians in the neighbourhood of Melitene, a town in the eastern part of Cappadocia, in which Khosru was completely defeated. He died in the spring of the following year, 579, after a reign of forty-eight years, and was succeeded by his son Hormisdas IV.

The virtues, and more particularly the justice of this monarch, form to the present day a favourite topic of eastern panegyric; and the glories and happiness of his reign are frequently extolled by poets as the golden age of the Persian sovereignty. His reign forms an important epoch in the history of science and literature: he founded colleges and libraries in the principal towns of his dominions, and encouraged the translation of the most celebrated Greek and Sanscrit works into the Persian language. A physician at his court, of the name of Barzûyeh, is said to have brought into Persia a Pehlvi translation of those celebrated fables which are known under the name of Bidpai or Pilpay; and it was from this translation of the Indian tales that these fables found their way to nearly every other nation of Western Asia and Europe. The conquests of Khosru were great and numerous; his empire extended from the shores of the Red Sea to the Indus, and the monarchs of India, China, and Tibet are represented by Oriental historians as sending ambassadors to his court with valuable presents to solicit his friendship and alliance. (See the original passage in Ewald's 'Zeitschrift für die Kunde des Morgenlandes,' vol. i. p. 185.)

KHOSRU II., the grandson of Khosru I., was elevated to the throne of Persia, A.D. 590, on the deposition of his father Hormisdas by Bindoes, a noble of the royal blood. In the first year of his reign Khosru was obliged to leave his native country to escape from the treachery of Bahram, who rebelled against his sovereign and seized upon the royal power. Khosru took refuge in the dominions of Maurice, the emperor of Constantinople, who assisted the Persian monarch with a numerous army, with which he was enabled to defeat Bahram, and again to obtain possession of the sovereignty. The friendship of Maurice was however purchased by the surrender of some of the most important towns of Mesopotamia and the payment of a large sum of money. During the life of Maurice, peace was preserved between the two nations; but on his assassination by Phocas in 602, Khosru took up arms to revenge the death of his benefactor, and in the space of fourteen years subdued almost all the provinces of the Greek empire. In 611 Antioch was taken; in the following year Caesarea, the capital of Cappadocia, fell into the hands of the Persians; in 614 the whole of Palestine was subdued; in 616 Egypt was conquered, and Alexandria taken by Khosru himself; while another Persian army subdued the whole of Asia Minor, and advanced

as far as the Bosphorus. The Roman empire was on the brink of ruin; the capture of Alexandria had deprived the inhabitants of Constantinople of their usual supply of corn; the northern barbarians ravaged the European provinces; while the powerful Persian army on the Bosphorus was making preparations for the siege of the imperial city. Peace was earnestly solicited by Heraclius, who had succeeded Phocas in 610, but without success. Khosru however did not cross the Bosphorus, and at length, in 621, he dictated the terms of an ignominious peace to the emperor. But Heraclius, who had hitherto made very few efforts for the defence of his dominions, rejected these terms; and in a series of brilliant campaigns (A.D. 622-627) recovered all the provinces he had lost, repeatedly defeated the Persian monarch, and advanced in his victorious career as far as the Tigris. Khosru was murdered in the spring of the following year, 628, by his son Siroes.

KIEN LOONG, son of the emperor Yung Tching, and grandson of Kang He, succeeded his father on the throne of China in 1735, being then twenty-six years of age. The principal events of his long reign are: 1. The war which he carried on, from 1753 to 1759, against the Olots or Eleuts, the Kasbgar, and other Tartar nations of central Asia, who, under the descendants of Galdan, or Contaish, the Tartar chief, who was subdued by the arms of Kang He in 1696, had again revolted. Kien Loong defeated them, and again established the Chinese supremacy over central Tartary, north-west of China, as far as Kasbgar. In consequence of these successes a great triumph took place at Peking in April 1760, on the return of the victorious army. 2. In 1770 the Turguts, a Mongolian tribe, dissatisfied with the Russian government, having removed from the banks of the Volga, after crossing the steppes of the Kirghis and other tribes, came to place themselves under the protection of China, when Kien Loong, rejoicing at this event, gave them a part of the country of the expelled Eleuts. 3. In 1773 Kien Loong attacked and conquered the Miao-tse, a race of mountaineers on the borders of the province of Koei-cheow, north-west of Canton, who had never been subdued before. By the Chinese accounts great barbarities were committed by the conquerors, and the tribe was said to be nearly exterminated; but we find this same tribe rising again in great numbers in 1832, and giving full employment to two Chinese armies commanded by the viceroys of Canton and of Hoonan. Kien Loong commemorated his victory over the Miao-tse by paintings, which were copied and sent to France to be engraved. 4. About the years 1790-91, the rajah of Nepal having invaded Tibet, a Chinese army was sent against him, which obliged him to withdraw to his own dominions, and the country of Lassa or Tibet was placed under the protection of China. (Staunton's 'Narrative of Lord Macartney's Embassy,' vol. ii., ch. i.)

Among the remarkable circumstances of Kien Loong's reign may be mentioned his edict of 1753, forbidding the exercise of the Christian religion under severe penalties, in consequence of which a kind of persecution against the Christian converts took place in several of the provinces. The Jesuit missionaries at Peking however, as men of science, continued to enjoy the favour of the emperor, who was himself fond of learning, and a poet. [AMIOT, LE PERE.] He collected an immense library of all the most interesting Chinese works, and caused a geography of China to be compiled, as well as a Chinese and Mantcheou dictionary. Another remarkable occurrence of his reign is his reception of the British embassy in 1793, the particulars of which, upon the whole reflect credit upon the character and intellect of Kien Loong.

In February 1796, Kien Loong, having completed the sixtieth year of his reign, abdicated in favour of his son Kea King, a very inferior man to his father. Kien Loong died in February 1799.

KILIAN, the name of a distinguished family of engravers of Augsburg. There have been many engravers of this name and family, but four were artists of superior ability: Lucas and Wolfgang, the sons of Bartolomeus Kilian, a goldsmith, who was born in Silesia in 1548, and died at Augsburg in 1583; Bartolomeus, the third son of Wolfgang; and Philipp Andreas Kilian, a more recent artist of the same family.

LUCAS KILIAN was born at Augsburg in 1579, and was educated as an engraver by his stepfather Dominick Custos. He studied also the works of Tintoretto and Paul Veronese at Venice, after which he engraved several prints which were sold at Augsburg and obtained him the reputation of one of the best engravers of his age; his style of drawing was however not quite correct, and was somewhat mannered. He died at Augsburg in 1637. Lucas had great command of the graver, and has been known to execute two portraits in a single week. His works are very numerous.

WOLFGANG KILIAN was born at Augsburg in 1581, was also instructed in engraving by his stepfather Custos, and, as his brother had done, studied also in Venice. The prints he there produced are the most carefully executed of his works. He was latterly compelled by the wants of a numerous family and hard times (it was during the Thirty Years' War) to look more to the quantity than the quality of his labour, and he accordingly executed chiefly portraits. His greatest work is the 'Celebration of the Westphalian Peace in Augsburg in 1649,' in two sheets, after a picture by Sandrart: it contains about fifty portraits. He died at Augsburg in 1662.

BARTOLOMEUS KILIAN, the third son of Wolfgang, was born at

Augsburg in 1630, and was first instructed in engraving by his father, who afterwards by his son's request sent him to study with Matthous Merrian, a celebrated engraver at Frankfurt-on-the-Mayn. From Frankfurt Bartolomeus went to Paris, where he remained a few years, maintaining himself by his own labour; and he returned to Augsburg about 1655, a very able artist both with the graver and the etching-needle. Sandrart terms him a born engraver: his works are very numerous, but are chiefly portraits. He died at Augsburg in 1696.

PHILIPP ANDREAS KILIAN, the son of Georg Kilian, closely related to the above, was born at Augsburg in 1714, and was taught engraving by G. M. Preissler in Nürnberg. He studied also in the Netherlands and in various parts of Germany, and became one of the most distinguished artists of his time; besides his technical skill in the use of the graver he had a good taste and was a correct draftsman, but his execution is somewhat peculiar and monotonous. In 1744 Augustus III., king of Poland and elector of Saxony, created Kilian his court engraver, and invited him to reside in Dresden, but Kilian preferred his native city. He however visited Dresden in 1751 for the purpose of conducting the execution of a collection of prints after the most celebrated pictures of the Dresden Gallery—'Recueil d'Estampes d'après les plus célèbres Tableaux de la Galerie de Dresde.' The completion of this collection was interrupted by the breaking out of the Seven Years' War in 1756. Upon the cessation of this work he commenced an extensive series of illustrations of the Bible in quarto, which he accomplished by the assistance of various other artists, to the number of 130 prints, but they are not among his best works. He executed many portraits, two of the best of which are the Emperor Francis I. and Maria Theresa, after G. von Mytens. Three days before his death he was engaged on a portrait of Pope Clement XIII., which he very nearly completed. He died in 1759.

Heineken enumerates twenty-one members of this family, of whom eighteen were artists, and fourteen of these engravers.

(Heineken, *Nachrichten von Künstlern und Kunststücken.*)

KILLIGREW, THOMAS, a younger son of Sir Robert Killigrew, was born at Hanworth in Middlesex in 1611. He travelled in his youth, was present at an exorcism of the nuns of Loudun, was appointed a page of honour to Charles I., and attended Charles II. during his exile, marrying one of the queen's maids of honour. His coarse and licentious wit qualified him peculiarly for securing the favour of his master, who in 1651, in spite of the remonstrances of his wiser counsellors, sent him as his envoy to Venice, where he used his place for raising money for himself, and was expelled with disgrace. On the restoration Killigrew became groom of the bed-chamber, and enjoyed an intimacy and influence with the king which the first men in the nation were unable to obtain. He has sometimes been said to have been officially appointed to be the royal jester; but for this assertion there is no ground, though he was in the habit of taking such liberties as none but professional jesters would in any other reign have been allowed to take. He died at Whitehall in 1682. He wrote eleven plays, of which the first two were printed in 1641, and the whole collection in a folio volume in 1664. They do not by any means justify his reputation as a wit. A sufficient specimen of them is furnished by the comedy of 'The Parson's Wedding,' reprinted in Dodsley's 'Old Plays.'

Killigrew's eldest brother, SIR WILLIAM KILLIGREW, a much more respectable person, was the author of four or five plays, and of two volumes of moral reflections. He died in 1693.

The youngest brother, DR. HENRY KILLIGREW, wrote a tragedy in his youth, took holy orders, and held several preferments. He was Master of the Savoy at his death, which took place after Sir William's. Dryden's fine elegy on Mrs. Anne Killigrew celebrates a daughter of Dr. Henry.

KIMCHI, DAVID, a very celebrated Jewish rabbi, was born in the 12th century in the south of France, and passed the greater part of his life at Narbonne. His father, Joseph Kimchi, and his brother, Moses Kimchi, also enjoyed much reputation among their contemporaries: they both wrote several works on Hebrew grammar and commentaries on the Scriptures, but none of them have been printed with the exception of 'A Commentary on the Life of Ezra,' by Moses Kimchi, printed in the Rabbinical Bible of Venice, 1549; and also a Hebrew Grammar by the same author, Venice, 1624.

David Kimchi has always been regarded by the Jews as one of their most illustrious rabbis. He possessed such great influence among his contemporaries, that he was chosen in 1232 arbiter of the controversy which had subsisted for some years between the Spanish and French rabbis respecting the opinions of Maimonides. He died about the year 1240.

The most important of his works are:—a Hebrew Grammar, entitled כּוּלּוּל ('Michlol'), that is, 'Perfection,' Venice (1545), Leyden (1631); and frequently reprinted; 'A Dictionary of Hebrew Roots,' Naples (1490), Venice (1529-52); &c. Kimchi also wrote commentaries on almost all the books of the Old Testament: the most valuable are said to be those upon Isaiah. Many of these commentaries have been printed separately: the whole of them were published by Breithaupt, Gotha, 3 vols. 4to, 1713.

KING, PETER, LORD, was born in 1669 at Exeter, in which town his father, Mr. Jerome King, though said to be descended from a good

family in Somersetshire, carried on the business of a grocer and salter. To this business he brought up his son, and the future Lord Chancellor of Great Britain served for some years in his father's shop. It was probably his relationship to the celebrated John Locke, whose sister was his mother, that put it into his head, while thus situated, to think of making himself a scholar; but the story told is, that he had by himself made extraordinary proficiency in learning, purchasing books with all the money he could procure, and devoting every moment of his leisure to study, before he was taken any notice of by Locke, by whose advice however he then went to the University of Leyden. How long he studied there we are not informed. He first made himself known by the publication, in an octavo volume, in 1691, of the First Part of his 'Inquiry into the Constitution, Discipline, Unity, and Worship of the Primitive Church,' in which with considerable learning he advocated the right of the Protestant dissenters from episcopacy to be comprehended in the scheme of the national establishment. The Second Part, occupied with the Worship of the Primitive Church, followed soon after. This work excited much attention, and, besides a correspondence between Mr. Edward Elys and the author, which was published in octavo by the former in 1694, drew forth, on its being reprinted in 1713, during the discussions on the Schism Bill, 'An Impartial View and Censure of the Mistakes propagated for the Ordaining Power of Presbyters in a Celebrated Book entitled An Enquiry, &c.,' in an appendix to 'The Invalidity of the Dissenting Ministry,' and also 'An Original Draught of the Primitive Church, in answer to a Discourse entitled An Enquiry, &c.,' 8vo, London, 1717. Both these answers professed to be 'by a Presbyter of the Church of England,' and the latter at least is known to be the production of a nonjuring clergyman named Sclater.

Meanwhile King had entered himself at the Inner Temple, and was in due course called to the bar. He appears to have begun very early to make a figure in his profession; and he also soon entered upon a political career, having in 1699 obtained a seat in the House of Commons as one of the members for Beerston, which he retained for seven parliaments, or to the end of the reign of Queen Anne. He did not yet however altogether abandon his first pursuit, but in 1702 published in octavo another learned theological work, 'The History of the Apostles' Creed, with Critical Observations on its Several Articles.' In July 1708 he was chosen Recorder of London, and was soon after knighted. In 1709 he was appointed by the House of Commons one of the managers at the impeachment of Dr. Sacheverell, and in 1712 he gave his services, without fee, as one of the counsel for Mr. Whiston, on his trial for heresy before the Court of Delegates. In November 1714, a few months after the accession of George I, Sir Peter King was made Chief Justice of the Common Pleas; and he was sworn a privy councillor in April of the following year. After the great seal had been taken from the Earl of Macclesfield, he was in June 1725 appointed Lord Chancellor, and was at the same time raised to the peerage as Baron King of Ockham in the county of Surrey. Lord King however did not as Chancellor satisfy the public expectation, or, it is supposed, his own; and he is said to have injured his health by his labours to make himself master of the department of professional learning necessary for his new duties. He resigned the seals on the 26th of November 1733, and died at his seat of Ockham on the 22nd of July 1734. By his wife Anne, daughter of Richard Seys, Esq., of Boverton in Glamorganshire, he left four sons, who all inherited the title in succession, and from the youngest of whom the present peer (created Earl of Lovelace in 1838) is descended.

KING, WILLIAM, a native of Ireland, a bishop and afterwards an archbishop in the Irish Church, was born in 1650. He is the author of two works on subjects of deep importance. One of these, 'The Inventions of Men in the Worship of God,' was intended to reconcile the Presbyterians of Ireland to the episcopal form of church order. But his greater work is his treatise on that difficult subject the Origin of Evil, which is written in Latin. His great object is to show that the existence of evil may be accounted for consistently with still acknowledging that God is great and good. These works excited much attention when they appeared, and that on the Origin of Evil was attacked by two eminent foreigners, Bayle and Leibnitz, to whom he made no reply; but he left among his papers notes of answers to their arguments, and these were given to the world after his death by Dr. Edmund Law, bishop of Carlisle, together with a translation of the treatise itself. He printed also a sermon 'On the Consistency of Divine Predestination and Foreknowledge with the Freedom of Man's Will.' In politics Archbishop King was a true friend to the revolution. The first considerable piece of preferment which he enjoyed was that of Dean of St. Patrick's, which he obtained in 1688. In 1691 he was made Bishop of Derry, and in 1702 Archbishop of Dublin. He died in 1729. He was through life held in high esteem as a man, as well as in his character of a prelate and writer on theology.

* KINGLAKE, JOHN ALEXANDER, the author of a celebrated book of eastern travels published in 1844 under the title of 'Eothen,' and which from the novelty and lightness of its style became at once unprecedently popular, is a London barrister of independent means. He was born at Taunton, Devonshire, in 1802, and educated at Eton and Trinity College, Cambridge, where he graduated B.A. in 1826, and whence he removed to study law at Lincoln's Inn. He was called to the bar in 1837. During the war in the Crimea Mr. Kinglake

visited the British camp, and various articles in the English newspapers describing the state of affairs in the Crimea were attributed to his pen, and also a brief sketch of General Guyon, entitled 'The Patriot and the Hero.' He has also contributed to the 'Quarterly Review' and other periodicals.

* KINGSLEY, REV. CHARLES, rector of Eversley, Hants, and canon of Middleham, was born at Holne Vicarage, Devonshire, on the 12th of June, 1819. His father, the Rev. Charles Kingsley, senior, is at present rector of Chelsea. The Kingsleys are an old Cheshire family (of Kingsley in Cheshire), tracing their descent from before the Conquest. They served with distinction on the parliamentary side during the civil wars, and suffered in consequence; and a younger branch of the family emigrated to America, and has left descendants there. After being educated at home till the age of fourteen, Mr. Kingsley became a pupil of the Rev. Derwent Coleridge, the son of the poet; from under whose care he removed to Magdalen College, Cambridge. Here he held a scholarship, and obtained distinction both in classics and mathematics; and took his B.A. degree, but did not proceed to that of M.A. For a time his intended profession was the law, but he ultimately decided for the church. He was appointed curate of Eversley, a moorland parish in Hampshire; and the rectory of this parish falling vacant in the second year of his curacy (1844), he was appointed to the living by the patron. In the same year he married the daughter of Pascoe Grenfell, Esq., many years M.P. for Truro and Great Marlow; another of whose daughters has since become the wife of another eminent man of letters of the present day, the historian and essayist, J. A. Froude. Omitting minor beginnings in periodicals and the like, Mr. Kingsley's first distinct appearances in literature were in a volume of 'Village-Sermons,' published in 1844, and in 'The Saint's Tragedy; or, the True Story of Elizabeth of Hungary, Landgravine of Thuringia, Saint of the Roman Calendar,' a drama in verse, published in 1848. Both works attracted attention—the one as an original and thoughtful poem; the other as a novelty in sermon-writing, from the Saxon plainness of the style, and the straightforward and bold, yet kindly and familiar, manner in which the preacher discussed topics of all kinds with his people. Those who knew Mr. Kingsley as a parish clergyman declared the sermons to be in this respect perfectly characteristic of the man in the pulpit, and in his intercourse with his parishioners. Mr. Kingsley, as a clergyman, belongs neither to the 'High' Church nor to the 'Low' Church, but to what has been called the 'Broad' Church party; that is, his name is associated in theological and ecclesiastical matters with those of Mr. Maurice, Archdeacon Hare, and others of the same order of thought. It was chiefly in association with Mr. Maurice that he began that career of open connection with the great social questions of the time in which, in conjunction with literary labour, the last six years of his life had been spent. Mr. Henry Mayhew's revelations of the state of the labouring classes in London were horrifying all minds, when Mr. Maurice, Mr. Kingsley, and others, conceiving it to be the special duty of the Church and of Christian clergymen to inquire into such things, arranged a series of meetings with the working men and some of the Chartist leaders of London, with a view to exchange ideas with them as to what was wrong and what ought to be done to rectify it. The result was the scheme of so-called 'Christian Socialism'—the plan of co-operative associations among the workmen themselves, without masters, seeming the most hopeful practical method of gradually raising the condition of the workmen; while both Mr. Maurice and Mr. Kingsley were careful to let their opinion be known that this or any other method would be eventually successful only in so far as it was an application to society of the true principle and ethics of the Christian religion. Capital was raised by the efforts of Mr. Maurice, Mr. Kingsley, and their friends; the money was lent at four per cent. to working men; and in this way several co-operative associations were set up in London, the most prosperous of which was one of working tailors.

Meanwhile, full of the facts and of the feelings of the movement, Mr. Kingsley had published his 'Alton Locke: Tailor and Poet,' a novel of which a tailor was the hero, and which, from the earnestness with which it treated social and political questions (the earnestness, it was said, of a 'Chartist clergyman'), as well as from its power as a work of imagination, at once made the author's name known over the country. 'Alton Locke' was followed in 1851 by a second fiction, philosophical rather than political, entitled 'Yeast: a Problem,' reprinted from 'Fraser's Magazine,' this in 1853 by a powerful historical and philosophical romance, also collected in two volumes from 'Fraser's Magazine,' and entitled 'Hypatia, or New Foes with an Old Face,' and this again in 1855 by 'Westward Ho! or the Voyages and Adventures of Sir A. Leigh, Knt., in the Reign of Queen Elizabeth,' a three-volume novel. In all these novels, while there is a singular blending of imaginative and descriptive power with philosophical thought, and also a remarkable liberality of sentiment, there is a uniform presence of the argument for the intellectual and social omnipotence of Christianity. The same spirit appears in publications of a different order which proceeded about the same time from Mr. Kingsley's pen—the 'Message of the Church to Labouring Men,' a sermon which reached its fifth edition in 1851; 'Sermons on National Subjects Preached in a Village Church,' 1852; 'Phaethon, or Loose Thoughts for Loose Thinkers,' 1852; 'Alexandria and her Schools,' the substance of four lectures delivered in Edinburgh in 1854; and

'Sermons for the Times,' 1855. Mr. Kingsley's last publications are—'Glaucus, or the Wonders of the Shore,' 1855 (an expansion of an article on the study of natural history which appeared originally in the 'North British Review'); and 'The Heroes, or Greek Fairy Tales' (an adaptation of some of the Greek myths for Children), 1858. Mr. Kingsley has contributed largely to 'Fraser's Magazine' and to the 'North British Review,' and more recently to the eighth edition of the 'Encyclopædia Britannica.' He has also delivered many lectures, some of which, in addition to those mentioned above, have been published separately or as parts of collections of lectures. Altogether, as he is one of the most popular writers of the day (as is proved by the sale of his writings), so he is certainly one of the most independent and influential; and being still young, much more is to be hoped from his farther life.

KIPPIS, ANDREW, D.D., F.R.S., a Unitarian divine, held in great estimation both among the members of his own communion and generally in the world of literature and science, was born in 1725. He was descended of ministers who had left the Church in 1662, on the passing of the Act of Uniformity, and was educated in a theological academy at Northampton, then under the superintendence of the pious and learned Dr. Doddridge. After a few years spent in the exercise of his ministry at Boston in Lincolnshire, and at Dorking in Surrey, Dr. Kippis settled in London in 1753 as pastor of a congregation of Presbyterian dissenters in Westminster, of which, before it adopted Unitarian views, Dr. Edmund Calamy, a name of note among the dissenters, had formerly been the minister. Dr. Kippis continued connected with this society till his death. The duties arising out of this connection did not preclude him from seeking other means of public usefulness. In 1763 he became a tutor in an academy for the education of dissenting ministers in London, on a plan similar to that on which the academy at Northampton had been conducted. In 1771 he was elected a Fellow of the Society of Antiquaries, and in the next year a Fellow of the Royal Society.

Dr. Kippis was a principal contributor to the 'Monthly Review' at a time when it was considered as the leading periodical work of the day. He had also much to do with the conduct of 'The New Annual Register.' There are several pamphlets of his on the claims of the dissenters and on other topics of temporary interest; but the work with which his name is most honourably connected is the republication of the 'Biographia Britannica,' with a large addition of new lives, and a more extended account of many persons whose lives are in the former edition of that work. The design was too vast to be accomplished by any one person, however well assisted. Five large folio volumes were printed of the work, and yet it had proceeded no farther than to the name of Fastolf. Part of a sixth volume, it is understood, was printed, but it has not been given to the world. Many of the new lives were written by Dr. Kippis himself, and particularly that of Captain Cook, which was printed in a separate form also.

Dr. Kippis's was a literary life of great industry. He was the editor of the collected edition of the works of Dr. Nathaniel Lardner [LARDNER, NATHANIEL], to which he prefixed a life of that eminent theological scholar. He published also the ethical and theological lectures of his tutor, Dr. Doddridge, with a large collection of references to authors on the various topics to which they relate, in two octavo volumes. A volume of his sermons was also published.

KIRBY, THE REV. WILLIAM, one of the most distinguished naturalists of his day, and celebrated for his knowledge of entomology. He was the grandson of John Kirby, a miller at Wickham Market in Suffolk, and the author of the 'Suffolk Traveller,' which was published in 1785, and was a work of great repute in its day. Joshua Kirby, a brother of the father of the subject of our present notice, was the friend of Gainborough the artist, and distinguished as an architectural draughtsman, and the author of a work on Perspective. William Kirby, his father, was a solicitor, and lived at Witnessham Hall, where the entomologist was born, on September 19th 1759. His mother, whose name was Meadows, of a family of some consideration in the county of Suffolk, early gave him a taste for the study of natural history. A collection of shells, and the plants of the fields, were the first objects to which his attention was directed. His natural history studies were however interrupted by his being sent to the grammar school at Ipswich, where it appears he did not distinguish himself. From thence he was entered at Caius College, Cambridge. Here again he failed to distinguish himself, for Cambridge had at that time no honours for those whose tastes led them to cultivate the natural sciences. He took his degree of B.A. in 1781; and having entered upon holy orders, was appointed shortly after to the cure of Barham, in his native county. In 1784 he married Miss Ripley of Debonham. At this time he became acquainted with the Rev. Mr. Jones of Nayland, whose writings on controversial divinity were highly estimated. Mr. Kirby had however no taste for polemics, and although he never neglected the duties of his office for the pursuit of natural history, his taste for the latter became so decided, that he published very little on subjects directly connected with his profession as a clergyman.

Left to the natural bent of his genius, and surrounded with objects of natural history, his early love of plants was rekindled, and he cultivated a knowledge of the plants of his neighbourhood. An accident drew his attention to insects. "About half a century since," he says in a letter to a friend in 1835, "observing accidentally one morning a

very beautiful golden bug creeping on the sill of my window, I took it up to examine it, and finding that its wings were of a more yellow hue than was common to my observation of these insects before, I was anxious carefully to examine any other of its peculiarities, and finding that it had twenty-two beautiful clear black spots upon its back, my captured animal was imprisoned in a bottle of gin, for the purpose, as I supposed, of killing him. On the following morning, anxious to pursue my observation, I took it again from the gin and laid it on the window-sill to dry, thinking it dead, but the warmth of the sun very soon revived it; and hence commenced my farther pursuit of this branch of natural history." These facts were communicated to Dr. Gwyn of Ipswich, who was a good naturalist, and led him to recommend to his young friend the pursuit of entomology. So diligent was Kirby in the pursuit of his new science, that we find him warmly taking up the cause of natural history science, and becoming one of the first members of the Linnæan Society, founded by Sir James Edward Smith in 1788. In 1793 he contributed his first paper to the Linnæan Society. It was entitled 'A description of three new species of Hirudo,' and was published in the second volume of the 'Transactions.' His next paper, which was published in the third volume of the same 'Transactions,' was 'A History of three species of Cassida.' In the same volume is a 'Letter to Mr. Marsham, containing observations on the Insects that infested the Corn in the year 1795.' He became early alive to the importance of making the pursuit of entomology of practical value, and paid particular attention to those insects which attacked wheat and other plants of importance to man. The last paper was followed by others on the 'Tipula Tritici,' on 'Insects that prey upon Timber;' and in the fifth volume of the 'Linnæan Transactions' is a paper entitled 'Observations upon certain Fungi which are parasites of the Wheat.' These and other papers indicate great accuracy of observation, and prepared him for a work of higher and more important scientific interest. The family of *Hymenoptera*, including the bees and wasps, had been but imperfectly studied in this country, and he devoted himself to the production of a separate and complete work on English Bees. This work was published at Ipswich in two volumes, with plates, in 1802, and was entitled 'Monographia Apum Angliæ, or an attempt to divide into the natural genera and families such species of the Linnæan genus *Apis* as have been discovered in England, with descriptions and observations.' This work embraced also general remarks on the class *Hymenoptera*, and a table of the nomenclature of the external parts of these insects. The publication of this work at once gave him a high position amongst the naturalists of Europe, and brought him into correspondence with Fabricius, Latreille, and other naturalists on the continent of Europe, as well as all the more eminent naturalists of his own country. This work was followed up by several papers, containing important additions to the literature of entomology, but was perhaps surpassed in scientific interest by his discovery of the genus *Stygops*, which he indicated as the type of a new order of insects, to which he gave the name *Stegopterygæ*. These insects were found parasitical during their larva state in the bodies of bees, and the novelty of their history and beautiful forms excited a lively interest in the entomological world.

But whilst these discoveries were going on, he was preparing for a work by which his name became more widely known and imperishably associated with the popular literature of his country. We allude to the 'Introduction to Entomology,' which he published conjointly with Mr. Spence. Mr. Kirby's acquaintance with the latter gentleman commenced in 1805, and resulted in Mr. Spence proposing in a letter dated November 23, 1803, that they should write in partnership a "popular Introduction to Entomology." This proposition was readily acceded to by Mr. Kirby, and in 1815 the first volume of this work appeared. It speedily went through three editions, and in 1817 the second volume was published. On account of the illness of Mr. Spence the third and fourth volumes did not appear till 1826. This work at once took a position amongst the classical productions of our language, and few scientific publications have been so extensively read. Since the death of Mr. Kirby, Mr. Spence has published a seventh edition, to which is added an appendix, giving an account of the origin and history of the work. It is written in the form of letters, and gives in a familiar style an account of the structure, habits, and forms of insects. It is a model of the manner in which works on natural history to be popular should be written, and is almost exhaustive of the subject of the habits, uses, injuries, and instincts of insects. Of the fifty-one letters of which this work consists, it appears that twenty were written by Mr. Kirby, nine by Mr. Spence, and twenty-two by the two authors conjointly.

In 1830 Mr. Kirby was applied to by the trustees appointed under the will of the late Earl of Bridgewater [BRIDGEWATER, EARL OF] to write one of the works since so well known as the 'Bridgewater Treatises.' Although in the seventieth year of his age, the production of such a work was so congenial to his tastes and the spirit in which he had conducted all his natural history researches, that he at once consented. The subject was the 'Habits and Instincts of Animals.' From his previous history it would appear that Mr. Kirby had not had such extensive opportunities of studying the other groups of animals so accurately as he had done insects. It is therefore, especially considering his age, not surprising to find that this work did not equal in merit his previous productions. It contains however a

great number of interesting facts which he collected with great diligence, in reference to all departments of the animal kingdom, and the spirit in which it was written was eminently in accordance with the object of the founder of the treatises.

Mr. Kirby's other principal labours are as follows:—'A Description of several new species of Insects collected in New Holland by Robert Brown, Esq., F.R.S.,' (*Linn. Trans.* xii.); 'An Account of the Animals seen by the late Northern Expedition whilst within the Arctic Circle,' 4to, London, 1821, being a supplement to the appendix of Captain Parry's 'Voyage for the Discovery of a North-West Passage.' The insects were described by Mr. Kirby. The insects in 'Fauna Boreali-Americana, or the Zoology of the Northern parts of British North America,' 4to, Norwich, 1837.

Although most exemplary in the performance of his clerical duties, Mr. Kirby was never promoted in the church of which he was so great an ornament. The only appointment he ever received in addition to the cure of Barham was that of chaplain to the district workhouse in 1794. In scientific circles his name was one of influence. He was chairman of the first meeting of the Zoological Club of the Linnæan Society, which was founded in 1827. This was one of the first offshoots of the Linnæan Society, and was followed by the establishment of the Entomological Society in 1833. Of this society Mr. Kirby was elected Honorary President, and he presented it before his death with his very valuable collection of insects. He was made a Fellow of the Royal Society in 1818, and of the Geological Society in 1807. He also received the honorary diplomas of many scientific societies on the continent and the United States of America. In 1847 a museum of Natural History was founded at Ipswich; he was present at the opening of this institution, and held the office of President till his death.

Mr. Kirby was twice married, his second wife being Miss Rodwell of Ipswich, to whom he was married in 1816. She died in 1844. He had no family by either wife, and died on the 4th of July 1850, at the great age of ninety. His 'Life,' to which we are indebted for many of the above particulars, has been written by the Rev. John Freeman, M.A., and was published in 1852.

KIRCHER, ATHANASIVS, born at Geysen, near Fulda, in 1602, entered at an early age the order of Jesuits, made great progress in various branches of learning, especially in the study of Hebrew and other Eastern languages, and was made professor of philosophy and Oriental languages in the college of Würzburg. He afterwards went to Avignon, where he became acquainted with the learned Peirese, and he there applied himself to the study of antiquities. From Avignon he went to Rome, visited Naples, Sicily, and Malta, and on his return was made professor of mathematics in the Roman or Gregorian college at Rome. He filled this chair for eight years, and resigned it in order to devote himself entirely to his favourite studies. He collected a valuable museum of antiquities, which he left to the Roman college, and which has been repeatedly illustrated. (Sepi, 'Romani Collegii Soc. Jesu Museum Athanasii Kircheri novis et rarioribus locupletatum,' fol., Amsterdam, 1678, with a complete list of all the works of Kircher, published and republished; Bonanni, 'Museum Kircherianum,' fol., Rome, 1709; republished by Battara, Rome, 1773; Contucci, 'Museum Kircherianum Ærea notis illustrata,' 2 vols. fol., Rome, 1763-65.) Kircher was liberally assisted by several princes and noblemen, German, Italian, and Spanish. He died at Rome, in November 1680. He was a man of very extensive and varied erudition, and a very copious writer; but his judgment was defective; he wanted criticism, and jumped too hastily at conclusions, fancying that he could resolve any question. He was also very credulous, as his works amply testify. He wrote on mathematical and physical sciences; on philology and hieroglyphics, and also upon history and antiquities. His principal works are:—1. 'Magnes, seu de Arte Magnetica,' libri iii.; 2. 'Primitiæ Gnomoniæ Catoptricæ, hoc est, Horologiorumque novæ specularis'; 3. 'Ars magna Lucis et Umbrae'; 4. 'Prodromus Coptus'; 5. 'Institutiones Grammaticales et Lexicon Copticum.' In these two last works he gave the best information up to that time concerning the Coptic language. 6. 'Œdipus Ægyptiacus, hoc est, Universalis Hieroglyphicæ Veterum Doctrinæ Temporum Injuria abolitæ Instauratio,' 4 vols. fol., Rome, 1652-54. Kircher dedicated this work to the Emperor Ferdinand III., whose eulogium is prefixed, written in 20 languages of Europe and Asia. The work is full of quotations from Rabbinical, Arabian, and Syriac writers. 7. 'China illustrata.' 8. 'De prodigiis Crucibus quæ post ultimum Incendium Vesuvii Montis Neapolii comparuerunt.' 9. 'Scrutinium Fæstivum.' 10. 'Latium, i. e., nova et parallela Latii tum veteris tum novi Descriptio, qua quæcumque vel natura, vel veterum Romanorum ingenium admiranda efficit, geographicæ-historicæ-physicæ Ratiocinio, juxta rerum gestarum temporumque seriem exponitur et enucleatur,' fol., Amsterdam, 1671, with maps and figures, and a minute description of Hadrian's villa, with a plan of it. This work of Kircher is one of his best, and may still be read with profit.

KIRWAN, RICHARD, a chemical philosopher of considerable eminence, was born in Ireland about the middle of the last century. He was intended for the profession either of law or medicine, and was sent to be educated by the Jesuits of St. Omer's. On the death of his brother however he succeeded to the family estate, left St. Omer's, and abandoned all thoughts of a profession. His whole life was

devoted to science, and he has also written on some subjects not immediately connected with it. His knowledge was extensive and his memory accurate; but though he lived at a time when Black, Cavendish, Priestley, and Scheele were greatly extending chemical science by their experiments, he did not contribute any very remarkable original discovery; he was nevertheless usefully employed in many investigations.

About 1779, when he was residing in London or its neighbourhood, he read before the Royal Society, of which he became a Fellow, several papers, and in 1781 the Copley medal was awarded to him. In 1789 he returned to Ireland, and was for some time president of the Royal Irish Academy, and he was elected member or associate of most of the literary societies of Europe.

It would be useless to attempt an analysis of the memoirs and works of Kirwan; they include not merely chemical subjects, but meteorology and mineralogy, and are diffused through the 'Transactions' of the Royal Society of London, those of the Royal Irish Academy, and other publications. One of his most remarkable separate works was 'An Essay on the Constitution of Acids,' in which he attempted to reconcile the ancient chemical philosophy with modern discoveries. This work was translated into French by Lavoisier, with notes in refutation of its doctrines by Guyton-Morveau and Lavoisier, &c. In these notes his reasonings were completely refuted, and Kirwan had the candour, too rarely exhibited, of admitting the erroneousness of his views. In 1794 he published 'Elements of Mineralogy,' in two volumes, 8vo; a work, though now of course obsolete, unquestionably useful in extending the knowledge of the science of which it treated. His 'Geological Essays' have never been considered as equally useful; but his 'Essay on the Analysis of Mineral Waters' contained a collection of what had been previously done on the subject, with new, and, in many cases, useful directions for conducting the requisite processes. In 1809 he published a work on logic, which furnished ample materials for critical severity. He died in 1812.

KISFALUDY, KAROLY, or CHARLES, the most popular dramatic poet of Hungary, was the youngest brother of SANDOR KISFALUDY, the most popular lyric poet. He was born on the 6th of February 1788, at Tete, and his birth cost his mother her life. His father never saw him with pleasure. As a boy he was unruly; and once when, after he had attained the age of sixteen, a professor at the High School of Raab struck him on the face, the pupil answered by hurling at him an inkstand. The army was thought the most suitable profession for a youth of this character, and in 1805 he went to Italy as an officer in Prince Esterhazy's regiment. The only book he took with him was his brother's poem of 'Himfy,' by a constant perusal of which, just at the period of life in which new faculties are awaking, he was led at first to make acquaintance with the Italian poets, and then to try his own powers in verse; but most of his early efforts were destroyed by himself in after years, and Schedel, his biographer, who had seen some of them, assures us that their disappearance ought to cause his admirers no regret. In 1809 he served in the Austrian campaign against Napoleon I. in Germany. In 1810 he quitted the army to marry; but he was so singularly unfortunate that his father, who had an objection to the lady, threw him off on finding him determined not to renounce her, and the lady threw him off on finding that he was at variance with his father. Deeply wounded in his inmost feelings, Kisfaludy found himself reduced to earn his bread, and established himself at Vienna, where for some years he turned to account some proficiency he had attained in painting, and obtained a scanty subsistence as an artist. His chief amusement was the theatre, to which we are told that he often devoted his last shilling. He became acquainted with the poet Körner, who was then on the point of being made the official poet of the Vienna Theatre, and it was at his suggestion that Körner took for a subject the Hungarian Leonidas, Zrinyi, who by his brave self-sacrifice at Sigeth checked the triumph of the Turks, and ended in sorrow the career of Solyman the Magnificent. Unfortunately, the remark of Kisfaludy on the play, that the manners were not sufficiently Hungarian, was not well received by Körner, and their friendship cooled. It was at Vienna that Kisfaludy first became a hard reader. "French poetry," says Schedel, "he did not consider poetry. Schiller, among the German authors, he early loved the most, and he remained faithful to the preference. Göthe he could never love, though he admired his 'Faust,' which was singular. But Shakspeare he read and studied perpetually, and from day to day more and more—at last almost to the exclusion of anything else. Of Shakspeare he was always ready to talk, and he placed him out of the line of even the great poets of the world—as a great solitary. He often said that from him and Lessing he had learned all that he knew that was of value. Scott was never a favourite with him." In 1817 his brothers reconciled him with his father, and he removed to Pesth, where, on his father's death in 1824, he came in possession of his inheritance. It was in 1819 that he suddenly became famous. The theatre at Pesth was in that year opened at the expense of Count Brunzsvik by a strolling company from Stuhlweissenburg, there being at that time no permanent company of Hungarian actors in the capital. For the sake of greater novelty, they wished to make their appearance with a new play. Kisfaludy offered them one on a national subject, entitled 'A Tatarok Magyarorazgabán' ('The Tartar in Hungary'), and on the 3rd of May it was produced. The

success was tremendous; and the enthusiasm of the audience for the author, who was present, knew no bounds: they almost forced him on to the stage to receive their thanks. He was applied to for another play, and had another in readiness on a national subject, 'Clara Zach'—a lady whose wrongs from the royal family, and their revenge by her father in 1330, form one of the darkest pages of Hungarian history. The authorities refused permission for the performance, and, not to disappoint expectation, Kisfaludy completed in four days a tragedy in four acts, entitled 'Ilka,' which was acted on the 16th of June, and was as successful as its predecessor. His next play, 'Stibor Vajda,' or 'Stibor the Chieftain,' written in ten days, was produced on the 7th of September, and on the 24th of the same month the comedy of 'A Kérők,' or 'The Suitors,' and in the same year another comedy, 'A Pártutók,' or 'The Insurgents.' In the course of eight months in 1819 five plays from his pen had been welcomed with the most tempestuous applause on the stage, and the verdict of the audience was afterwards ratified by the reading public. In the midst of his triumph the poet was not satisfied with himself, and applied to Kazinczy [KAZINCZY] for instructions how to write the Hungarian language, to some of the delicacies of which his long residence abroad had made him comparatively a stranger. The next year, 1820, was occupied with a fresh set of dramas, many of them of a comic character, in which it was the opinion of some of his admirers that he was more successful than in those of a serious cast; but this opinion, which was the poet's own, will not we think be shared in by most foreign readers. In the year 1821 he commenced the publication of a Hungarian annual, in imitation of the German works of the same class, under the title of 'Aurora.' Its success was great, and for several years it was the vehicle of conveying to the Hungarian public not only the new productions of Charles Kisfaludy in fiction and the drama, but contributions from almost all the other authors of distinction in the country. The more his popularity increased the more critical he became in his own productions, and he submitted with readiness to the adverse decisions of his friend Helmeözy, chiefly in matters of language and style. Encouraged by the success of the 'Aurora,' he was projecting other journals, and was sketching out a style of national tragedies, which he was confident would surpass all that had preceded, when, at the close of 1829, the fatal illness commenced which, after a short interval of apparent improvement, carried him off on the 21st of November 1830, at the age of forty-two.

The friends of Kisfaludy raised a subscription to erect a monument to his memory, which was so warmly patronised that the funds amounted to about 500*l.* more than was wanted. With this it was determined to publish a collected edition of his works, and also to institute prizes for the most successful productions in polite literature. The works met with so rapid a sale that the fund went on augmenting, and the society has become every year more and more important. One of its most valuable publications is the 'Nemzeti Könyvtár,' or 'National Library,' a collection of the best works in Hungarian literature, issued in a cheap but handsome form, in closely-printed double-columned octavos. The first volume of the collection comprises the works of Charles Kisfaludy, the greater part of which consists of plays, the remainder of tales and short poems. His fame will probably rest on his tragedies in verse, which are brief, energetic, and dramatic in their dialogue, and have the recommendation of being entirely national in their subjects.

KISFALUDY, SANDOR, or ALEXANDER, by general consent the first of the Hungarian poets of his time, was born at Sümeg in the county of Szalad, on the 22nd of September 1772. His full name in the Hungarian order of arrangement is Kisfaludi Kisfaludy Sandor or Alexander Kisfaludy of Kisfalud—in Scotland it would be said "of that ilk." Educated first at the high school at Raab, and afterwards at the University of Presburg, he was always among the leading pupils or students, but was not distinguished for application to the severer sciences. It was said that the violin was seldom out of his hand till he exchanged it for the sword. At the Diet of Presburg in 1791, when the Hungarian language, which had been banished from the tribunals by Joseph II., was restored to its rights, he was present as a spectator, and a flame of patriotism appears to have been kindled in his breast. His father who, in 1786, was left a widower with eight children, wished Alexander to study the law, but the young man's wishes were all for the army. A time of compulsion and discontent followed, in which Alexander spent his days over Verböczy, still the Blackstone of Hungarian jurisprudence,—though when the Turks overran the country, he turned Turk himself and became eminent as a cadí—and his nights in writing tragedies, of which it is remarkable that the subjects were far from national, one of them being entitled 'Ulysses and Penelope,' the other, 'The Death of Seneca.' At length the father yielded, and Alexander became in 1793 a cadet in a regiment quartered in Transylvania. In a letter to a friend named Szublics, written at this period on the occasion of his first passing the Hungarian frontier, it is remarkable with what confidence the young officer anticipates his future literary fame and devotes himself to the glory of his country. He was soon afterwards transferred to the regiment of Life Guards at Vienna, that remarkable regiment which, at one period, boasted five or six officers, all of whom had earned a name in their country's literature. On one occasion when Prince Nicholas Esterhazy, the colonel, took Lord Spencer and Lord Gran-

ville over the barracks, the party, much to the Englishmen's surprise, came on Kisfaludy in dehabille smoking his pipe and translating Tasso. He was at that time engaged in the study of the Italian poets, but had nothing unamiable about him, and might have passed on the parade-ground, where his tall and athletic figure set off his splendid uniform, for an officer whose thoughts were all in his profession. He had about this time a narrow escape from being involved in an affair of danger. Martinovic, the conspirator [KAZINCZY], who courted his society, had engaged him to attend a party at his house on a certain evening, and in the morning before it Martinovic was arrested on the charge of treason, for which he lost his head. Kisfaludy soon after fell in love with a young Hungarian lady, the beautiful Rosalia Szegedy, by whom he was at first looked on with favour, but ere long a misunderstanding arose, and they parted with feelings of mutual estrangement. His regiment was ordered to the wars of Italy at the period when the Austrian armies in that country were destined to a series of defeats from the rising genius of the young Napoleon. Kisfaludy was one of the garrison of the citadel of Milan, which surrendered to the conqueror in 1797, and he was sent as a prisoner of war to Vauluse. "In the spring-time of my youth," he says in a preface written in after-life, "I was a prisoner on the very spot where the sweet and melancholy songs of Petrarch filled the heart with love, among the fiery good-natured French." The thought arose of celebrating his own love to the Rosalia, to whom he was still attached, in a strain of poetry like that addressed to Laura, and he commenced a series of poems, for the most part still briefer even than sonnets, as the lines were equally scanty and the feet in each line were fewer. He went on with his poetical labours when returned, by exchange of prisoners, to the Austrian army and quartered in Wurtemberg, as one of a regiment which did not contain a single Hungarian but himself, where, "far from his country, his nation, and his kin," says one of his biographers, "he lived as an Hungarian only in his poem." Most of it was written in his solitary walks or on horseback. In the year 1799 he was engaged in the victorious campaign of the Austrians and Russians against the French in Switzerland, and took part in the great battle of Zurich. This was the last of his military experience. In the next year he returned to Hungary; he succeeded in regaining the affections of his Rosalia, and he left the army a married man to settle on his estates at his birthplace Sümeg in 1801. His poem, or collection of poems, was published anonymously at Buda in 1800, under the title of 'Himfy.' "Never before or since," says Döbrentei, writing in 1839, "did any book excite such a sensation in Hungary as this." The name of 'Himfy' was on every tongue, and it became an object of general curiosity to discover the "Great Unknown" who wrote it. In a second edition, which appeared in 1807, the author revealed himself, and he published at the same time a second part of the poem which bore the name of 'Boldog Szerelm,' or 'Happy Love,' and described the wedded life of Himfy with his Liz, the poetic name which Kisfaludy assigned to the object of his affection. In the same year the first part of his 'Regék a Magyar Előidőből,' or 'Legends from Hungarian Days of Yore,' made their appearance, and were also warmly received.

From the year 1801 he was settled for more than forty years at Sümeg, engaged in the management of his estates, and in particular in the cultivation of the vine, to his skill in which Sobana, the author of some volumes on the Hungarian vineyards, pays a respectful tribute. Though so good a farmer his pen was not idle. In 1816 he tried his powers as a dramatic poet in 'Hunyadi János,' a play in five acts, on the exploits of John Hunyadi, the celebrated Hungarian hero, but not with his wonted success. It was said that though he described his characters well, he had not the power of putting them in action. He wrote a few other plays, 'Ladislaus the Cumanian,' 'The House of Darda,' &c., which were afterwards collected in two volumes (Buda, 1825-1826), but none of them ever met with the marked success which was showered on those of his brother Charles, the founder of the Hungarian stage. The metre of those in verse, which was very irregular, like the metre of Southey's 'Kehama,' seems to have met with little favour, though it appears at first sight not unsuited to the varied emotions of dramatic poetry. He also wrote additional legends, which were worthy of their predecessors: one of his poems, 'Gyula Szerelm,' or 'Julia's Love,' published in 1825, was considered a failure, and Kisfaludy gradually allowed himself to pass into retirement. He spent most of his time in rural occupations, except on an annual visit to one of the Hungarian watering-places, when groups of the young and literary were fond of gathering round him. He was always of a lively and cheerful disposition, though his poems wear a general air of tender melancholy, which he himself describes as a national Hungarian characteristic, observing that "it may be said the Hungarian even dances in tears." His brother Charles, who was of a remarkably gloomy turn, was on the contrary fond, in his works, of aiming at broad humour, in which the Hungarian critics consider that he succeeded. Kohl the traveller, who visited Sümeg in 1841, gives an interesting account of an interview with its then widowed master. In 1843 a festival in honour of Kisfaludy was held at Pesth, in which, among other speeches, Kötvös declared that "some of the poet's works were more and some less successful, but there was not one that was not national in every thought and feeling, and he had never written a

line of which every word was not thoroughly Magyar." In the next year (1844) Kisfaludy died at Sümeg on the 28th of October.

A complete edition of Alexander Kisfaludy's works was published at Pesth in 1847 in six octavo volumes, under the editorship of Schedel, who also edited the works of his brother. Some of the shorter poems of his 'Himfy' have been happily rendered into English by Bowring, and in the second part of the 'Himfy' there are others of greater length which would probably be attractive in an English translation if the easy and natural air of the original could be preserved; but it may be doubted if his 'Legends' are sufficiently striking and spirited to be likely to please in an English form. Except in the drama, in which as has been said, they are singularly varied, his metres are apt to be monotonous, and the general style of Kisfaludy was censured by Kazinczy as careless, an opinion which seems to have drawn down on the critic the wrath of the poet, who on this occasion showed that he indeed belonged to the "irritable race."

* KISS, AUGUSTUS, an eminent German sculptor, was born in 1802 at Pleas in Upper Silesia. Having completed his professional studies under Rauch—whose studio he entered in 1824—he for several years executed with much local success statues and groups of the ordinary order of classical subjects; at first, as is customary among German artists, from the designs of Rauch, Schinkel, and others, and subsequently from his own. It was not till the completion of his colossal group of the 'Amazon attacked by a Tiger' (the model of which was finished in 1839—it was cast in bronze by a public subscription some years later) that his fame spread beyond Germany. That work has of late made the name of Kiss well-known in this country, a zinc cast of it, carefully bronzed after the original, having formed one of the most noticeable features of the Great Exhibition of 1851. Kiss has since executed a still more vast group of 'St. George and the Dragon,' which at the French Exposition of 1855 occupied as prominent a place as did the 'Amazon' in the English Exhibition. But the 'St. George and the Dragon' met with much severer criticism than its predecessor; and generally it perhaps would not be too much to say that Kiss is more highly esteemed in Berlin—where he is professor of sculpture in the Royal Academy—than elsewhere. It is impossible to deny that his works exhibit considerable knowledge, great elevation of style, immense vigour, and much skill in modelling, but we should hesitate to admit the presence of the higher exertions of mental power, or refined feeling. He is unquestionably a sculptor of a very high, but not, as has been somewhat rashly affirmed, of the highest order.

KITTO, JOHN, was born at Plymouth, December 4, 1804. His father had been a respectable builder, but soon after his son's birth became much reduced in circumstances through the adoption of intemperate habits. At four years old John Kitto was transferred to the care of his maternal grandmother, by whom his intellect was called into activity by the relation of marvellous stories, and by leading him to notice and admire the natural objects around him in the fields and woods. He early learned to read, and read with avidity all the books he could procure. By the time he was twelve years old, his father had descended to the rank of a jobbing mason. He was unable to keep his son at school regularly, who, whenever he could be made available, was required to attend his father in his labours. On February 13, 1817, having ascended a ladder with a load of slates, he fell from a height of thirty-five feet. He was taken up senseless, conveyed home, and lay for a fortnight in a state of unconsciousness. He recovered, but was himself unaware at first that he was deaf. He wondered at the silence around him, and at length, asking for a book, was answered at first by signs, and next by writing on a slate. He inquired with astonishment, "Why do you not speak?" His attendants wrote again, "You are deaf." No efforts could restore his hearing. He still continued his reading, but in 1818 his grandmother was obliged to quit Plymouth, and he was left to the care of his father. For nearly a twelvemonth he lived with his parents in a state of great destitution. At length, on November 15, 1819, he was placed in the workhouse, where he was treated with much indulgence, and began to learn shoemaking. His deafness occasioned him to write often, and by constant practice he acquired great facility. In August 1820 he commenced a journal, which he continued till January 1822, and he was encouraged to write lectures which were read to the other boys. In 1821 his grandmother died, which event made a great and serious impression on his mind. In November 1821 he was apprenticed to a shoemaker; but his master was harsh, he was somewhat awkward, and still passionately devoted to reading. Finding himself uncomfortable, he wrote to some of his friends, and after pleading his cause in writing before the magistrates, he was taken back to the workhouse in May 1822. Early in 1823 he wrote some essays which were published in Nettleton's 'Plymouth Journal,' and he also wrote some imaginary correspondence. In April 1824, Mr. Grove, a dentist, who had known something of him in Plymouth, but who was then settled at Exeter, engaged him in order to teach him his art, and he accordingly removed to Exeter, where he succeeded in attaching Mr. Grove to him as a sincere friend. In 1825 he published his first work, a volume entitled 'Essays and Letters, by John Kitto.' It produced but little profit, but it contributed to make him known, and excited the interest of many of the inhabitants of Plymouth. By their efforts, greatly assisted by Mr. Grove, he was

sent to the Missionary College at Islington, there to be taught printing, which it was thought might render him useful in some of the missionary establishments abroad. He entered that institution in July 1825, and was despatched to Malta as a printer in June 1827, but his health being unequal to his work, he returned to England in February 1829. In the following May he agreed to accompany Mr. Grove on an extensive tour to the East, during which he was to instruct Mr. Grove's children. In this journey he visited St. Petersburg, Astrachan, the Calmuck Tartars, the Caucasus, Armenia, Persia, and Baghdad. At this latter town he was detained during the plague. Mr. Grove there lost his wife, and Kitto thence returned to England in June 1833.

In July of that year, Mr. Woolcombe of Plymouth wrote a letter of introduction for him to Mr. Coates, the secretary of the Society for the Diffusion of Useful Knowledge, recommending him for employment on the 'Penny Magazine.' On the 18th he waited on Mr. Coates with a letter written by himself, in which he proposed a plan of writing his travels, either in the form of weekly numbers, "like the 'Penny Magazine,'" or as volumes of the 'Library of Entertaining Knowledge.' Mr. Coates referred him to Mr. Charles Knight, as editor of those works, telling him he thought the society could not undertake the travels in the 'Entertaining Knowledge.' On the 19th he wrote to Mr. Knight, stating his willingness to use his journal for separate papers in the 'Penny Magazine.' On the 20th he called on Mr. Knight: the conversation was carried on by Mr. Kitto speaking, which he did very imperfectly, and Mr. Knight writing. A few letters afterwards passed, specimen articles were sent and approved of, and on the 4th of August he accepted Mr. Knight's proposals for a general engagement at a salary, saying that "the terms offered would be sufficient not only for my present but my prospective wants." He continued for two years in various literary employments. In 1835 Mr. Knight formed the plan of publishing a Pictorial Bible with notes, and asked Mr. Kitto if he would like to furnish a few of them, illustrating particular passages from what he had observed in his travels. He not only eagerly embraced the proposal, but earnestly entreated to be allowed to undertake the responsibility of the entire work. A specimen was prepared, and eventually it was approved of: the whole was then entrusted to him. The 'Pictorial Bible' was finished in 1838. During its progress, for about two years and a half, Mr. Kitto received an annual payment of 250*l.*; but upon its completion he was presented with an additional sum, which seemed to him a little fortune. In 1838 he embodied a great portion of his experience in Persia in two small volumes, 'Uncle Oliver's Travels.' In 1839 and 1840 he was engaged in writing the 'Pictorial History of Palestine,' also for Mr. Knight. He was entitled to ask, and he received, for these and subsequent works, payments according to the highest scale of literary remuneration. From 1841 to 1843 he found employment with Mr. Fisher in preparing the letter-press for the 'Gallery of Scripture Engravings,' in 3 vols. In 1843 he wrote a 'History of Palestine,' published by A. and C. Black of Edinburgh; and 'Thoughts among Flowers,' published by the Religious Tract Society. In 1844 the degree of D.D. was bestowed upon him by the University of Giesen in Prussia.

In 1845 he renewed his connection with Mr. Knight, and prepared 'The Pictorial Sunday Book,' and wrote 'The Lost Senses—Deafness and Blindness' for 'Knight's Weekly Volume.' In this year he commenced the 'Cyclopædia of Biblical Literature,' published by A. & C. Black. In 1847 he undertook for Mr. Knight a new edition of the 'Pictorial Bible,' of which he greatly improved the notes, and which was completed in four volumes in 1849. For this revised edition he received upwards of 600*l.* It is right to mention, that although Mr. Kitto in his latter years was uneasy in his circumstances, his difficulties were not caused by inadequate payments by his various publishers; nor did he sustain any loss whatever by any one of them, as is stated in his 'Biography.' In 1848 he had commenced on his own account the 'Journal of Sacred Literature,' which was continued periodically under his editorship till 1853, but he says himself that it never produced him any profit. He also engaged in various other works, among the most considerable of which were 'Daily Bible Illustrations,' two series, in seven volumes, of which the first series appeared in 1849-51, and the second in 1851-53. In February 1854 he was attacked by a paralytic stroke, from which he never completely recovered. In August he went to Ramsgate without experiencing much benefit. He had received a pension of 100*l.* a year in 1850 from her Majesty, and his friends having raised a subscription to a considerable amount to relieve him from embarrassments, he went to Germany, and settled at Cannstadt in Würtemberg. Here he died on November 25, 1854. He had married a lady in 1833, by whom he had a large family. She was a most effective assistant to him in his literary labours, and a sedulous promoter of his comforts. Since his death she has published a biography of her late husband, prepared by the Rev. J. E. Ryland, founded on materials left by himself either in the form of journals or of letters.

* KLAPKA, GENERAL GEORGE, was born April 7, 1820, at Temeswar, in southern Hungary, where his father was burgo-master. In 1838 he entered as a cadet into a regiment of artillery, whence, two years afterwards, he passed into a corps of bombardiers. In 1842 he was appointed a sub-lieutenant in the Hungarian regiment of

guards, and during five years pursued his military studies at Vienna. In 1847 he was transferred to the twelfth frontier regiment with the rank of lieutenant-colonel. At the commencement of the Hungarian revolution in 1848 he offered his services to the Hungarian diet, which were accepted. He was first sent to gain over the Szeklers in Transylvania, and next sent on active service against the Servians as captain of the 6th regiment of Honveds. He was afterwards sent to Comorn and then to Presburg, to assist in forming the defences at those places. He was raised to the rank of General, became chief of the general staff, and was for a time secretary-at-war to the Hungarian provisional government. He displayed great skill and intrepidity throughout the war, but especially distinguished himself by his defence of Comorn, of which fortress, some time before the termination of the contest, he had been made the commandant. On the 3rd of August 1849 a sally was made at midnight from the fortress. The Austrian investing army was defeated with the loss of 30 pieces of artillery, 3000 muskets, large stores of ammunition, baggage, provisions, and 2000 head of cattle, all of which were conveyed by the victors into Comorn. The Austrian army was obliged to evacuate Raab, where also abundance of stores were left, and to retreat to Presburg. By this victory the Austrian line of operations was broken, and the communication of their armies with Austria was in the power of General Klapka and his garrison. Couriers were immediately dispatched to inform Kossuth and Görgei of these events, while Klapka was hastening his preparations for following up his successes; but before the courier reached Görgei he had capitulated, and the other courier found Kossuth on Turkish territory. On the 11th of August Klapka received information of the disastrous state of the Hungarian army of the south, and a day or two afterwards a letter arrived from Görgei, informing him of the surrender of the Hungarian army, and requiring him to deliver up the fortress of Comorn unconditionally to the Austrians. General Klapka however held the fortress till he obtained honourable conditions from General Haynau. On the 2nd, 3rd, and 4th of Oct. 1849, the Hungarian soldiers, without arms, marched out of the fortress, and every man received a warrant of safe-conduct to his home. The officers marched out with their swords. Each of them received a similar warrant of safe-conduct, and was provided with a passport to go where he pleased. General Klapka came first to England, but afterwards went to Geneva. In 1850 he published 'Memoirs of the War of Independence in Hungary,' 2 vols. 12mo, London, translated from the original manuscript by Otto Wenckstern. Soon after the commencement of the war with Russia, he proceeded to the East with the intention of forming an opinion of the manner of carrying on the contest. He returned before the taking of Sebastopol, and published 'The War in the East from the Year 1853 to July 1855, an Historico-Critical Sketch of the Campaigns on the Danube, in Asia, and in the Crimea, with a Glance at the probable Contingencies of the next Campaign, by General George Klapka, translated from the Original Manuscript by Lieut.-Col. Mednyánsky,' 12mo, London, 1855.

KLAPROTH, MARTIN HENRY, a distinguished analytical chemist, was born at Wernigerode in Upper Saxony on the 1st of December 1743. It was his intention to study theology; but the severe treatment which he met with at school disinclining him to study, he preferred the profession of an apothecary, and he accordingly spent seven years in the public laboratory at Quedlinburg, where he learnt little else than how to manipulate in pharmaceutical operations. After spending two years in the public laboratory at Hanover, he went to Berlin, and in 1770 went to Danzig, in both which places he was an assistant in a laboratory; he afterwards returned to Berlin as an assistant to Valentine Rose, one of the most distinguished chemists of the day, and on his death in 1771 he succeeded him, having, at the request of Rose, undertaken the superintendence of his office and the education of his two sons. In 1780 he underwent the necessary forms and examinations for the profession of an apothecary with great applause. His thesis 'On Phosphorus and Distilled Waters' was printed in the 'Berlin Memoirs' for 1782.

Klaproth's various analyses and contributions to chemical science were diffused through periodical publications till 1796, when he began to collect and publish them. This work, under the title of 'Contributions to the Chemical Knowledge of Mineral Bodies,' was published in German; the last and sixth volume appeared in 1815, about a year before the death of the author. Besides this work, which contained 207 treatises, he published a 'Chemical Dictionary' jointly with Professor Wolff, and he superintended a new edition of Gren's 'Manual of Chemistry.'

To enumerate the various minerals which he analysed by processes perfectly new and peculiar, and with greater accuracy than had ever before been practised, would be tedious; we may however mention, as the results of these labours, the discovery of the peculiar metal uranium in pechblende, and the earth zirconia in the hyacinth; he also more perfectly detailed the properties of titanium, which had previously been discovered by Gregor in Cornwall, and of tellurium, which had been noticed by Muller as a peculiar metal. There were many minerals which, when Klaproth began their analysis, he found it extremely difficult to render soluble in acids, and without this it was in many cases impossible to arrive at a correct result; among these bodies was the corundum, or adamantine spar. This substance, though consisting almost entirely of clay or alumina, so long resisted all pro-

viously known means of analysis, that Klaproth at first regarded it as a peculiar and distinct earth. He found however that by treatment with caustic potash, instead of the carbonate, in a silver crucible, this refractory mineral was at length rendered soluble in acids, and was in fact alumina. Numerous other improvements were introduced by this laborious and accurate analyst, into the processes of the chemist; the above is not the least important, and has therefore been referred to as a specimen of the value of his contributions to science. The above process was of itself sufficient to alter the face of mineralogy, and indeed it is hardly asserting too much when we state that of all analyses previously performed scarcely half a dozen were correct. The great services thus rendered to chemistry and mineralogy were duly appreciated; about 1787 he was elected a member of the Royal Academy of Arts; and the year following he was chosen a member of the Royal Berlin Academy of Sciences. In 1782, he was made assessor in the Supreme College of Medicine and Health, and he was professor of chemistry in the Royal Mining Institute; he had also other honourable appointments; and in 1811 the King of Prussia added the Order of the Red Eagle of the third class. He died at Berlin on the 1st of January 1817.

KLAPROTH, JULIUS HEINRICH VON, one of the most eminent Oriental scholars of modern times, was born at Berlin, on the 11th of October 1783. He was the son of the celebrated chemist Klaproth [KLAPROTH, MARTIN H.], who wished to bring him up to his own profession, but the boy was little inclined to it, and employed most of his time on other pursuits unknown to his father. He was about fifteen when, during a public examination of the pupils of the college in Berlin where he received his instruction, he was so backward that one of his examiners cried out indignantly, "Why, you know nothing at all." "Beg your pardon," answered young Klaproth, "I know Chinese." His answer was received with astonishment and distrust, but he immediately gave proofs of his having made great progress in that difficult language, and he became henceforth an object of admiration to all who had an opportunity of witnessing his extraordinary talents. He had learned Chinese secretly without the help of a master, and, according to his own saying, he first began it in 1797, after he had found out a small and incomplete, but nevertheless valuable collection of Chinese books in the public library at Berlin. His father soon became reconciled to the pursuits of his son, but perceiving that he devoted his time exclusively to Oriental languages, he sent him, in 1801, to the University of Halle, with a strict injunction to study the classical languages.

Klaproth remained several years at Halle, and in 1802 published the first number of his 'Asiatisches Magazin.' The learned Count John Potocki having heard of Klaproth, hastened to make his acquaintance, and was so struck with him that he immediately proposed to him to enter the service of the Emperor Alexander of Russia. Klaproth accepted the proposition, and the count being in great favour with the czar, Klaproth was formally invited to settle in Russia. Upon his arrival at St. Petersburg, early in 1805, the Academy of Sciences presented him with a diploma of Adjunctus, for the Eastern languages and literature, and the Russian government being then engaged with the plan of sending an embassy to China, Count Potocki obtained for Klaproth the place of an interpreter. Klaproth actually got his commission before the appointment of an ambassador. This honour was finally bestowed upon Count Golowkin, a vain and ambitious man; and Count John Potocki was put at the head of a body of scholars who were to accompany the embassy. Klaproth set out alone, before the embassy was ready to undertake the journey, and after having traversed the Ural Mountains, and passed through Katherinenburg, Tobolsk, and Omsk, employing all his time in studying the country and its inhabitants, he finally arrived at Irkutsk, which was the place of meeting for all the members of the embassy. Count Golowkin and his suite arrived soon after him, in October 1805, and after having been detained some time at Irkutsk and Kiakhta, the embassy crossed the Chinese frontier on the 1st of January 1806. They had scarcely proceeded a hundred and eighty miles when they were again detained, Count Golowkin having refused to submit to the Chinese court-ceremonial, and after having remained a month in a miserable Mongol town, the count was informed that the court of Peking did not wish to see him. The embassy consequently returned to St. Petersburg. Klaproth however did not accompany them, but took a solitary route through Southern Siberia, and only reached the Russian capital in the beginning of 1807.

The information which he brought back to St. Petersburg was deemed so important, and his own abilities were so fully acknowledged, that before the end of the year he was sent on a scientific mission to the Caucasian provinces. He returned from this country in January 1809, with a large stock of scientific and political knowledge, most of which afterwards formed the subject of separate works and articles in learned periodicals. The Academy of St. Petersburg chose him an extraordinary member, and the emperor conferred upon him the title of Aulic councillor, and made him a knight of the order of Wladimir, an honour which placed him among the Russian nobility. However Klaproth had expected still greater distinctions, and the Russian government having secretly put a stop to his intended publication of his journey through the Caucasus, he began to feel uneasy in Russia. He nevertheless prolonged his sojourn in Russia, and was active in

establishing a school of Oriental languages at Wilna, and in making a descriptive catalogue of the Chinese and Mandshu manuscripts in the imperial library at St. Petersburg. He was sent, in 1811, to Berlin, for the purpose of superintending the engraving of the characters which were intended for printing those manuscripts. In 1812 he tendered his resignation to the Russian government, and after a considerable time received his dismissal, with the remark that by soliciting permission to retire he had forfeited all his civic and scientific titles and privileges in Russia. In St. Petersburg however there were strange rumours afloat as to the real cause of his disgrace, and it was said there, and afterwards repeated in foreign countries, that his love of rare manuscripts and books went beyond mere scientific attachment.

No sooner was Klaproth free than he began to bring out his journal of his travels in the Caucasus; but Germany became the theatre of a long and bloody war, and the learned Orientalist fled from place to place without finding repose for his pursuits. During this war he became acquainted with some of the most distinguished men in the French armies, and his name became known to Napoleon. Klaproth's admiration for the French emperor must have been great, for after Napoleon had been banished to Elba he suddenly left Germany and visited the fallen hero in his exile. Napoleon received him very well, and it appears that Klaproth, expecting the emperor's early return to France, offered him his services, and was chosen the future editor of one of the first newspapers in France. The 'hundred days' however passed away without any notice being taken of Klaproth, and when the Bourbons returned to Paris he was at Florence, in rather uncomfortable circumstances. Count John Potocki having heard of this, invited him to settle in Paris, and there Klaproth lived some time by his pen, when he accidentally met with William von Humboldt, who, although he had seen him only once, employed all his influence to procure for him a situation suitable to his pursuits and his merits. It was at Humboldt's recommendation that the late King of Prussia, Frederick William III., conferred upon Klaproth the honorary title of Royal Professor of Oriental Languages and Literature, which was accompanied with a liberal pension, and a promise to defray the expenses of printing whatever works the professor might think fit to publish. Klaproth was further allowed to stay in Paris as long as he pleased. Placed beyond all want, and moreover enjoying an income which enabled him to gratify his love of pleasure and refined society, Klaproth now exhibited an extraordinary activity, and it was in the years subsequent to 1816 that he published most of those literary productions which established his European reputation. The life which Klaproth led in Paris, leaving his study only to plunge into the torrent of mental and physical excitement of the gayest capital of Europe, proved fatal to his health. In 1833 the symptoms of a dropsy of the chest becoming alarming, a tour to Berlin, where he was received with great distinction by the king and the public, produced a good effect; but shortly after his return to Paris the symptoms became worse, and his bodily sufferings were unfortunately accompanied by occasional derangement of his intellectual faculties. The skill of the first physicians of Paris proved ineffectual, and after long and painful sufferings Klaproth died suddenly, on the 27th of August 1835, and was buried in the cemetery of Montmartre.

Klaproth was one of the best scholars and decidedly the best linguist of an age which can justly boast of great linguists. His penetration and sagacity, and the quickness of his perception, were extraordinary; clearness and perspicuity distinguish his style; and his memory was so happy and capable of retaining the most different impressions without ever confounding them, that he seldom made more than scanty extracts. When he began a work it was already clear and distinct in his mind, and the composition did not take him more time than was required for the mechanical act of writing. If we compare Klaproth with William von Humboldt, we find that Klaproth had the superiority in analytical power, while Humboldt surpassed Klaproth in the synthetical. Klaproth's biographer in the 'Biographie Universelle,' says that he was naturally of a kind disposition towards everybody. Yet this kind man was the dread both of his literary enemies and friends. The former dreaded his answers to their attacks, and the latter observed the greatest precaution in their intercourse with him, lest they should irritate his irascible temper; and it would seem as if he made no distinction between scientific and moral error, so severely did he handle those who incurred his scorn through a display of inaccuracy or ignorance in matters of learning. His controversy with Professor Schmidt, the Mongol scholar in St. Petersburg, is an instance of this.

It would take much space to give a complete catalogue of his numerous publications, especially as the majority of them consist of pamphlets, memoirs, and dissertations, many of which are not of any general interest. Previous to 1812 he had only published some minor works, as, for instance, 'Inscription des Yü, übersetzt und erklärt,' 4to, Halle, 1811, being a German translation, with notes, of a Chinese inscription; and articles in different learned periodicals. The 'Asiatiches Magazin' was edited by himself. The following are his most remarkable works:—

1, 'Reise in den Kaukasus,' with maps, Halle and Berlin, 1812-14, 2 vols. 8vo: of these 'Travels in the Caucasus' a French translation, with valuable additions, appeared in Paris in 1823; 2, 'Exécution d'Automne' ('The Autumnal Execution'), Peking, 20ème année Kia

King, 8ème lune, jour malheureux: 'this severe critique of Weston's translations from the Chinese was published in Paris in 1815; 3, 'Supplément au Dictionnaire Chinois-Latin du Père Basile de Glemona, imprimé en 1813, par les soins de M. de Guignes,' Paris, 1819, fol.; 4, 'Abhandlung über die Sprache und Schrift der Uiguren,' &c., Paris, 1820, 8vo (a 'Treatise on the Language and the Characters of the Uigurs'); 2nd edition, in French, Paris, 1823; 5, 'Asia Polyglotta,' in 4to, with tables, in folio, Paris, 1823; 2nd edition, Paris, 1829, with a Life of Buddha according to the legends of the Mongols: this is a classification of the Asiatic nations according to their languages, with a comparative vocabulary of most of the Asiatic languages; 6, 'Examen critique des Extraits d'une Histoire des Khans Mongols, inséré par M. Schmidt dans le 6ième vol. des Mines de l'Orient,' Paris, 1823, 8vo; 7, 'Sur l'Origine du Papier Monnaie en Chine,' Paris, 1823, 8vo: this very interesting treatise on the origin of paper-money was shortly afterwards translated into English; 8, 'Tableaux Historiques de l'Asie depuis la Monarchie de Cyrus jusqu'à nos Jours,' with twenty-four maps, Paris, 1824-26; 9, 'Mémoires relatifs à l'Asie,' &c., Paris, 1824-28, 3 vols. 8vo, with maps and engravings; one of the most valuable works on Asia. 10, Dr. W. Schott's 'Angebliche Uebersetzung der Werke des Confucius aus der Ursprache, eine literarische Betrügerei,' Leipzig and Paris, 1825, 8vo: 'Dr. W. Schott's alleged translation of the works of Confucius, from the language in which they were originally written; a literary fraud,' by W. Lauterbach (the pseudonymous name of Klaproth). Two Chinese, the one a labourer and the other a cook, having arrived in Germany, got their livelihood by showing themselves for money. They excited the curiosity of the learned, whom they persuaded that they were priests of high rank, and the Prussian government believing their story, sent them to Halle, where they were to teach Chinese in the university. There Professor Schott became acquainted with them, and made use of their names and assistance in publishing a German edition of the works of Confucius, which however was little better than a re-translation of previous English translations. Klaproth, with his usual sagacity, discovered the fraud, unmasked the Chinese impostors, and chastised Schott most severely, but, in this instance at least, most deservedly. 11, 'Tableau historique, géographique, ethnographique, et politique du Caucase et des provinces limitrophes entre la Russie et la Perse,' Paris, 1827, 8vo; one of the most important works on the Caucasus, especially at the time when it was written. 12, 'Vocabulaire et Grammaire de la Langue Géorgienne, publié par la Société Asiatique,' Paris, 1827: the first part is Georgian-French, the second French-Georgian. 13, 'Vocabulaire Latin, Persan, et Coréan, d'après MS. écrit en 1303,' Paris, 1828, 8vo. This vocabulary was copied from a manuscript which once belonged to Petrarch, and was first published in the 'Journal Asiatique.' 14, 'Chrestomathie Mandchou,' Paris, 1828, 8vo; 15, 'Aperçu de l'Origine des diverses écritures de l'ancien Monde,' Paris, 1832; 16, 'Lettre sur les Découvertes des Hiéroglyphes Arcologiques adressée à M. le Comte de Gouliano,' Paris, 1827, 8vo, followed by a 'Seconde Lettre' on the same subject, addressed to Mr. D. S.—, published in the same year; and, 17, 'Examen critique des Travaux de M. Champollion, jeune, sur les Hiéroglyphes,' Paris, 1832, 8vo; 18, 'Notice d'une Mappemonde et d'une Cosmographie Chinoises, publiées en Chine, l'une en 1780, l'autre en 1793,' Paris, 1833, 8vo; 19, 'Nipon o Dai itairan, ou Annales des Empereurs du Japon, traduit par M. Isaac Titsingh, revu et corrigé sur l'original par M. Klaproth, et précédé d'une Histoire Mythologique du Japon,' Paris, 1834, 4to.

Among the publications edited or translated by Klaproth, we must mention the publications of the Asiatic Society of Paris, of which he was one of the founders; Guldénstädt's Travels in the Caucasus; Count John Potocki's Travels in the steppes of Astrakan and the Caucasus; Father Della Penna's description of Tibet; a description of the same country, translated from the Tibetan language into Russian, and thence into French; Timkowski's Travels to Peking; 'Magazin Asiatique,' from 1825-27, &c. Among his minor productions a letter to Baron Alexander von Humboldt on the invention of the compass, and another on the art of printing and gunpowder, are both important and interesting. Klaproth's contributions to the learned periodicals of France, Germany, and Russia would fill more than twenty octavo volumes. Klaproth was not only an Oriental scholar, but also an excellent theoretical as well as practical geographer, as appears from Critical Observations on Arrowsmith's Map of Asia; his 'Carte de l'Asie Centrale, d'après les cartes levées par l'ordre de l'Empereur Kiang-Loung, par les Missionnaires de Peking,' Paris, 1835, in four large sheets; 'Carte de la Mongolie, du Pays des Mandchou, de la Corée, et du Japon,' Paris, 1833; and many others of a smaller compass, in several of his works. Klaproth left ready for the press, 'Description géographique, statistique, et historique de l'Empire Chinois,' which was to appear in French and English, but has not yet been published. He left incomplete a manuscript containing the plan of a new 'Mithridates,' and a Commentary on Marco Polo. A complete catalogue of all his publications is contained in 'Catalogue de la Bibliothèque de feu M. de Klaproth, par le Libraire Merlin, Paris, 1839, 8vo.

KLÉBER, JEAN-BAPTISTE, according to the best authorities, was born at Strasbourg in the year 1754, though some place the date of his birth three or four years earlier. He was brought up by his

father, who was a domestic in the household of the Cardinal de Rohan, to the profession of an architect, and was sent to Paris at an early age to complete his studies. While these circumstances enabled him to render some important services to two young Bavarians, who, having interested themselves in his behalf, induced him to accompany them to Munich, and through their influence he entered the military college of that city. His rapid progress in acquiring the science of war gained him the patronage of General Kaunitz, son of the celebrated Austrian minister of that name, by whom, at the completion of his college career, he was appointed to a sub-lieutenancy in an Austrian regiment. He served seven years in that corps, which he left in 1783, in order to return to his native country. He there resumed his former profession, and obtained the situation of inspector of public buildings at Belfort in Upper Alsace.

The breaking out of the French Revolution opened to him a more brilliant career. He had taken a prominent part in a revolt at Belfort in 1791, and had enabled the republicans of that town, by putting himself at their head, successfully to resist the regiment of Royal Louis, which had been called to suppress it. To screen himself from the consequences of this action he enlisted as a private soldier in the grenadier company of the battalion of volunteers which had been raised in the department of the Upper Rhine. By his bravery and talents he soon attained the rank of adjutant-major, in which capacity he acted for some time under General Custine, and when Custine was afterwards brought to trial, he had the courage to present himself before his sanguinary judges, and give testimony in his favour. At the siege of Mayence in 1793 he displayed considerable courage and judgment: his services were rewarded by the rank of adjutant-general, and shortly afterwards he became brigadier-general. From thence he was ordered to La Vendée to oppose the insurgent royalists; he led there the soldiers of the garrison of Mayence, on whose courage and devotion he could reckon. At the celebrated combat of Tourfou (September 19, 1793), while charging the enemy at the head of the advanced guard of his regiment, he fell with several wounds, and his life was only preserved by the prompt assistance of his soldiers. The agents of the National Convention construed into a crime his humane interference in stopping the cruelties which were exercised towards the prisoners and the unoffending inhabitants of the country. However he was only removed to a command in the Army of the North, and afterwards in that of the Sambre and Meuse, when he rose to the rank of a general of division.

At the battle of Fleurus (June 26, 1794) he commanded the left wing of the French army, and by his skilful manœuvres greatly contributed to the victory. He then marched against Mons, which he retook from the Austrians, and having forced the passage of the Roer, he drove the enemy back to the right bank of the Rhine. Returning towards Maastricht, he took that strong fortress, after a siege of twenty-eight days.

In 1795 he directed the passage across the Rhine of the army of the Sambre and Meuse, and, when compelled to retire before superior forces, he effected a retreat in which his cool intrepidity and skilful dispositions were alike remarkable. In the year following he partook of the glory which attended the success of General Jourdan's operations at the opening of the campaign; and he afterwards refused the command of Pichegru's army, when that general was disgraced for holding treasonable communications with the enemy. [PICHEGRU.]

Discontented with the manner in which the Directory managed the military affairs, Kléber retired to Paris, where he spent the greater part of the year 1797, and occupied himself with writing his memoirs. When however Bonaparte was appointed to the chief command of the army for Egypt, he made it a special request to the Directory to be allowed to take Kléber as one of his generals of division. At the siege of Alexandria, on the first landing of the French forces, Kléber was wounded in the head while gallantly climbing the ramparts, but he did not retire from the conflict till he had received a second and a severer wound. When the city was taken he was appointed to the command of it, and of the whole province of which it was the head-quarters. He afterwards joined his division and took part in the expedition to Syria; he there distinguished himself by the capture of the forts of El Arish and Gaza, and was at the taking of Jaffa. He was also at the memorable siege of St. John of Acre, where he rendered himself conspicuous by his undaunted bravery, and shared every danger with the common soldiers. He was however withdrawn from the siege by order of Bonaparte, who desired him to march with his division to reinforce the troops stationed at Nazareth under the command of General Junot, and to repel the large army composed of the remnants of the Mamelukes under Ibrahim Bey, the Janissaries of Aleppo and Damascus, and numerous hordes of irregular cavalry, who were advancing to the support of their besieged countrymen at Acre. There he won the battle of Mount Thabor (April 17th, 1799), which terminated after a desperate contest, in which he sustained for six hours the impetuous attacks of a greatly superior force, in the total defeat of the Turkish troops. The siege of Acre however was renewed in vain, every assault against it proved unsuccessful, and "British valour, combined with Asiatic enthusiasm," was finally triumphant.

The French on their return to Egypt obtained at Aboukir another signal victory over the Turks; and the day after this decisive battle

Bonaparte returned to Alexandria, where he learnt the capture of Corfu by the Russians and Turks, and the close blockade of Malta by the same powers. These circumstances, combined with the loss of his fleet at the battle of the Nile, determined him upon leaving Egypt. On the 22nd of August 1799 he secretly embarked, accompanied by several of his generals, his secretary Bourrienne, with Berthollet and Monge, who had joined the expedition for the furtherance of science. Before leaving he signified his resolution to Kléber in a letter, by which he appointed him his successor in the chief command of the Egyptian army, and authorised him to conclude a convention for the evacuation of the country in the event of no succour arriving from France during the following spring, and if the mortality from the plague among his soldiers should amount to fifteen hundred men.

The sudden departure of Bonaparte spread anxiety and distrust throughout the camp; the reputation of his successor however, who enjoyed the highest confidence of the army, tended greatly to dissipate their fears. But the talents of Kléber did not at first appear to be equal to the difficult circumstances in which he was placed. He not only permitted himself to be swayed by feelings of indignation at what he deemed the abandonment of the army by its former chief, but he committed the fault, which in his position became a crime, of openly declaring his opinions to his dissatisfied colleagues in command; he thus caused the seeds of discontent and desire of home, which had been previously sown among the troops, to ripen to a maturity which soon threatened the ruin of the expedition. A letter addressed by him to the Directory contains many erroneous and exaggerated statements which had been furnished by Poussielgue the army administrator, and presents a most gloomy picture of the state of affairs in Egypt. A copy of it is in the 'Memoirs' dictated by Napoleon at St. Helena to the Count de Montholon, and is rendered the more valuable on account of the copious comments which accompany it, and which, though written in no friendly spirit, are for the most part borne out by contemporary testimony. In this letter Kléber complains that his army is reduced to one-half; that it is destitute of the necessary stores and munitions, and that the greatest discontent prevails. He further asserts that the Mamelukes were dispersed but not destroyed, and that the Grand Vizier was marching from Acre at the head of thirty thousand men. Two copies of this letter were sent, one of which fell into the hands of the English, and was the immediate cause of the expedition under Sir Ralph Abercromby, by which the French were compelled to abandon Egypt.

Kléber, under the influence of these despondent feelings, addressed proposals of accommodation to the Grand Vizier; though at the same time he made vigorous preparations to repel the Turkish army. An unexpected reverse moreover increased the necessity of a negotiation. The Grand Vizier with upwards of forty thousand men had crossed the desert, and, assisted by some British officers, had captured the fort of El Arish, justly deemed one of the keys of Egypt. General Dessaix was, against his will and contrary to his judgment, appointed negotiator on the part of the French, and, after many debates and frequent delays, a convention was signed at El Arish on the 28th of January 1800, by which it was agreed that the whole of Kléber's army should return to Europe, with its arms and baggage, either on board their own vessels or some furnished by the Turks; that all the fortresses of Egypt, with the exception of Alexandria, Rosetta, and Aboukir, should be surrendered within forty-five days from the time that the convention was ratified; and finally, that the vizier should pay a sum equivalent to about 120,000*l.* during the time that the evacuation was taking place. The English admiral, Sir Sidney Smith, though not vested with full authority from his government to conclude such a convention, had entered willingly into it, and was honourably preparing to see it carried into effect. Three months however before these events the British government had despatched orders to Lord Keith, who had the command of the Mediterranean fleet, to refuse his consent to any treaty in which it was not stipulated that the French army should be considered prisoners of war; and a letter from this admiral reached General Kléber, warning him of his intention to detain any vessel returning to Europe by virtue of a capitulation.

The French commander made a noble use of the opportunity which was now presented to him of retrieving his military character. Danger revived his energies and roused his courage. He immediately ordered the evacuation of the strongholds to be stopped, and prepared to resume hostilities. In one of those animating proclamations so common in modern French warfare, he indignantly declared to his soldiers that victory was the only answer to such insolence, and bade them be ready to fight. This appeal to their courage was received by the shouts of the army. On the night of the 19th of March 1800, Kléber formed his army, which was 12,000 strong, into four squares, with the artillery at the angles and the cavalry between the intervals; the two squares on the left were commanded by General Regnier, and those on the right by General Friant; the whole army was drawn up on the plain fronting the ruins of Heliopolis. Before them was the Ottoman army, amounting to upwards of forty thousand men; in their rear was Cairo with its three hundred thousand inhabitants, waiting only the signal of success to join the standard of their faith. The formation of the French had taken place by moonlight; perfect order and deep silence prevailed throughout the ranks, and every soldier felt that the fate of Kléber and of Egypt hung on the issue of the contest. A large body

of Turkish troops had been stationed in the village of Matarieh, and a movement was made by the division of Regnier to cut it off before the remainder of the army could come up to its support. No sooner did the Janizaries perceive the approach of the hostile columns than, sallying forth from their entrenchments, they attacked them with desperate courage. But Regnier drove the Turks back to their entrenchments, while the grenadiers, pressing on over masses of the dead and dying, scaled the works, and became masters of the camp. This combat was but the prelude to a general attack, for the vizier's army was marching to avenge the destruction of its advanced guard. Vast masses of Turkish cavalry soon enveloped the compact squares, by whose murderous fire they fell so rapidly that a barrier of bodies was formed around them, and impeded the renewed attacks of the impetuous horsemen. Asiatic valour could not long withstand European discipline, and the Turks at last fled in confusion towards the desert. Kléber, following up his success, hastened to El Kangah, where was posted the remainder of the enemy's army, who seeing themselves so closely pressed, hastily retired, leaving behind them the whole of their baggage and munitions. Thus ended the battle of Heliopolis, important in its results, and attended by little loss to the French, who numbered only two or three hundred killed and wounded.

The relief of Cairo, in whose citadel two thousand men under General Verdier were closely besieged, was the next object. The firing had scarcely ceased in the plains of Heliopolis when the sound of a distant cannonade was heard from Cairo; it informed Kléber that fresh exertions were required, and he instantly proceeded to the rescue of his countrymen. The Turks under Ibrahim Bey, who formed the besieging army, agreed, on hearing the result of the previous battle, to evacuate the town; but the excited populace of Cairo refused to listen to any terms, and prepared themselves for a desperate resistance. It became necessary to take by storm Boulak, a fortified suburb, and the French, who had returned from the pursuit of the Grand Vizier, invested the city. On a further refusal to surrender, a severe cannonade was directed against it, and it was finally entered by assault. A desperate struggle ensued between the besieged, who occupied the houses, and the besiegers, who were pressing on in the streets. Night alone terminated the contest; and on the following morning the Turks offered to capitulate, and were permitted to do so on favourable terms. Kléber, in this instance, as in many others, enhanced his victory by his moderation and humanity. About the time that these events were taking place, another body of the Turkish army had laid down their arms to General Belliard; and Mourad Bey, the chief of the Mamelukes, deprived of every hope of ultimate success, concluded an honourable convention with the French commander. Thus, within a month of the battle of Heliopolis, the French were again in possession of their previous conquests.

Released from immediate danger, Kléber now began to direct his energies to more pacific labours, and to apply them to the administration of the conquered country. His plan appears to have been to distribute portions of land among the veterans of his army, and to adopt a course similar to that pursued by the British government in India, of enlisting in his service the native troops. Scarcely however had he entered on this work when he became the victim of an obscure assassin. A young man, a native of Aleppo, named Suleiman, was incited to the atrocious act by religious fanaticism and the prospect of an ample reward. He had performed the pilgrimages of Mecca and Medina, and his mind was deeply imbued with the tenets of the Mussulmans' faith. Having armed himself with a poignard, he followed Kléber several days without being able to effect his purpose, when he at length determined upon concealing himself in an abandoned cistern in the garden attached to the mansion which the general occupied. On the 14th of June 1800, Kléber was walking in that garden with Protain, the architect of the army, and he was pointing out to him some repairs which the building required, when Suleiman presented himself before him as a suppliant for alms; while Kléber was listening to his petition, he seized the opportunity of rapidly striking him several times with his dagger. The architect, who was armed with a stick, attempting to interfere, received a severe though not deadly wound. The guards having hastened at the cries of Kléber, secured the assassin, whom they found concealed behind some ruins. A military commission was immediately assembled to try the assassin, who boldly confessed, and even gloried in his crime. Four sheiks, the partakers of his confidence, were beheaded, and Suleiman was impaled alive.

Thus prematurely perished this distinguished general, and with him the hopes of the eastern expedition. He had formed many important designs for colonising the country, and French writers believe, as Bonaparte used to assert, that under his rule it might have been preserved a valuable acquisition to the French Republic. According to Dr. O'Meara, Napoleon I. declared, that of all his generals Desaix and Kléber possessed the greatest talents.

* KLENZE, LEO VON, architect, who has designed the greater number of the remarkable series of edifices with which the ex-king Ludwig of Bavaria enriched his capital and kingdom, was born in 1784, at Hildesheim, in a principality of that name at the foot of the Harz Mountains. Here his father was a magistrate; and Klenze was sent to the Collegium Carolinum at Brunswick, and afterwards to Berlin, where he received a general and scientific education. He adopted

architecture in preference to any other pursuit, having attended the Bau-Akademie at Berlin, where he had made some progress in the study of art under Professor Gii y, the master of the architect Schinkel. His choice of architecture as a profession did not immediately meet with his father's approval; for the events at the outset of the present century gave little promise of either fame or profit in connection with the undertaking in Germany of any public works. The objections to his choice however were not persisted in, so that in one or two years after his residence at Berlin he was able to enter upon a tour of study in France, England, and Italy. He spent some time at the Polytechnic School at Paris, where he was under Durand and others. In Sicily his studies helped to consolidate that love of the old Greek architecture which he has retained through life, and which has in some of his works operated against the full development of his real powers as to new design. In Genoa he made the acquaintance of a lover of art, the owner of one of the palaces, who became his patron, and who afterwards filling a high office in the court of King Jerome of Westphalia procured Klenze in 1808 the appointment there of Court Architect, and afterwards a similar appointment in Cassel. These appointments were not of much value, and on the change of political affairs in 1813 they were lost, when Klenze resorted to Munich, where he soon became known to the crown prince, afterwards King Ludwig, who had already conceived projects for the works of his reign, and who was especially attached to classical art. Even prior to this the idea had been conceived of erecting a Walhalla, or Hall of Heroes, in Germany; and in 1814 the king Maximilian I. of Bavaria issued a programme for designs by architects for such a building. Whether designs were actually received we do not find stated. At the time of the congress of Vienna, Klenze was in that capital, and thence he went to Paris, where he again met with the crown-prince, through whom he was invited in 1815 to settle at Munich as Court Architect. In 1816 he was commissioned to prepare designs for the Walhalla; but that work was not commenced till fourteen years later, though in 1821 some materials were prepared. In 1816 also it would seem the Glyptothek was thought of, as the depository of a collection forming since 1808, and as one of an intended group of buildings, each to exhibit its distinct order of colonial architecture. These buildings, three in number, namely, the Glyptothek, the Propylæa, and the Exhibition Building, have since been erected. In 1819 Klenze was named Hofbau-intendant, or building-inspector for the court; and in 1820, as generally stated, the Glyptothek was commenced. In 1823 he accompanied the crown-prince to Italy, who was received with acclamation at Rome by the rising school of German artists. In 1825 Louis ascended the throne, and from that time Klenze was the friend and adviser of the monarch in those efforts by which he added one great work nearly every year to the buildings of Bavaria. From 1826 the office held by Klenze was that of Oberbaurath. The Glyptothek was hardly completed till the year 1830, in which year the Walhalla was commenced. In that year he was named President of the Council for Buildings; and in 1831 he was made a privy councillor, and elevated to the rank of nobility. During the progress of the Glyptothek Klenze built the Reit-Bahn, or Riding-house, commenced in 1822; the Kriegs Ministerium, or War Office, 1824; the Odeon, 1826; the Allerheiligen Kapelle, 1826; the Pinakothek, 1826, commenced on the 7th of April, the birthday of Raffaele; the new wings of the Residenz, or palace, called Königsbau and Festsaalbau, 1827; the palace of Prince Maximilian, 1828; and the Ionic Monopteral edifice, decorated in polychromy, in the English Garden, 1833. The style of these buildings is very varied. Klenze was also the architect of some private residences in the Florentine style; of the restoration of the monument of Adolph of Nassau, in the cathedral of Speyer; of the new street called the Linden-strasse at Munich; of the bazaar in a so-called 'Venetian' style; and of the wing of the Post-Office. Besides the Walhalla, his later works include the Ruhmeshalle, in the Grecian style, with the Doric order—the colossal figure of Bavaria being in front of the building. He was also employed by the Emperor Nicholas of Russia to erect the new Imperial Museum at St. Petersburg—a Græco-Italian building, and one of the best of his works.

The styles exhibited in these works are very varied, including not merely in the exterior of the Walhalla, a reproduction of the Parthenon, but beyond that Greek style, a modified and highly artistic version of Greek expressed in the Glyptothek, and on an Italian groundwork in the Imperial Museum; and more direct transcripts of Italian, Florentine, Byzantine, and Lombardic, and attempts at Gothic. With this extended range of efforts it was impossible to attain equal success: the attempts doubtless were dictated by the king. Where Klenze does his powers as an artist most justice, it has usually been with the aid of Greek models, which however he does not always reproduce, as in the exterior of the Walhalla—in the exception of the terraces and steps;—but he can, as in the interior of the same building, preserve all the pleasure of association with an old style, and yet engraft on it new design, and fresh and beautiful forms of art. In other works he has invented an extraordinary number of ornaments and details, which are at once consistent with the style, new and beautiful. In such points of view his works present a great contrast to the contemporary attempts at the reproduction of Greek architecture in England. The Glyptothek and the

Propylæa are good illustrations of his best style. The former building, which has an interior more Roman than Greek, was elaborately embellished internally like most of the Munich buildings. Within the entrance are three inscriptions, each over a doorway, one in honour of the king, another of the architect, and the third of the painter Cornelius. Klenze's attempts in other cases are less successful, as in the Königsbau, which resembles the Pitti Palace at Florence with some alterations. His few works in the Gothic style are singularly wanting in feeling of the spirit and character of the style,—which however he has not thought highly of,—having said it had the character of "stupendous littleness." Like all architects who achieve much that is great, he trusts mainly to himself for drawings, of which Mrs. Jameson says that he told her, before the completion of the Residenz, that he had made 700 with his own hand. As an architectural painter he is said to be very skilful.

The Walhalla was completed externally in 1839, and inaugurated in 1842; the Imperial Museum was designed about the year 1839, and completed within the last few years, as also the Ruhmeshalle.

In 1834 Klenze was sent to Athens to suggest any requisite improvements in King Otho's capital. One result of the visit was his 'Aphoristische Eemerkungen,' published in 1838. Another of his works is a collection of designs for churches, wherein he attempted to show that the Grecian style ought to be exclusively adopted by Christians of all sects. The greater number of the designs are however very much below the measure of his ability; and the publication was attacked by Wiegmann in a publication with the title 'Der Ritter Leo von Klenze und unsere Kunst,'—wherein also he depreciates the design for the Walhalla; to which it had originally been intended to give an interior of Roman character, and therefore it was thought inconsistent. Klenze has also published his designs for the decorations of the palace; but he will be best appreciated from his 'Sammlung Architectonischen Entwürfe,' which contains the best of his Greek designs. This work however illustrates a too general fault in German publications, which has contributed to tardy appreciation of German art,—for the publication in parts has not only extended over very many years, but the parts are of all sizes, and description is wanting where required. Amongst the distinctions which have been conferred by various princes and academies in Europe on Leo von Klenze, may be named the Royal Medal of the Institute of British Architects. Few architects, ancient or modern, have had the same opportunities of distinguishing themselves; and few perhaps in a similar situation could have achieved more success. It is Klenze's especial merit that he is not only an assiduous cultivator and student of the antique, but he is still the architect and originating artist; and all lovers of classical architecture owe him a debt for the practical proof which he has afforded of the real vitality of the principle of art in the Greek style; regarding which, the inability to do the like, in this country at the same date, is the chief reason of the revulsion in taste which now depreciates the style below its merits.

KLINGENSTIERNA, SAMUEL, a Swedish mathematician and philosopher, was born in 1689 at Tolefors, near Linköping, and received his education at Upsal. It was intended by his parents that he should follow the law as a profession; but, after having made some progress in the study of jurisprudence, he abandoned that pursuit, his taste inclining him to the cultivation of the mathematical sciences.

His first production was a dissertation on the height of the atmosphere; and this was followed by one on the means of improving the thermometer: both dissertations were, in 1723, inserted in the 'Memoirs' of the Royal Society of Upsal. In 1727 he set out from Sweden for the purpose of improving himself by travelling; and, after passing through parts of Germany and France, he made a visit to England, whence he returned in 1730. At Marburg he became known to the celebrated professor Wolf, and applied himself diligently to the study of his philosophy with a view of introducing it into Sweden on his return. At Paris he was introduced to Clairaut, Fontenelle, and Mairan; and he is said to have communicated to those eminent mathematicians some useful remarks concerning the integral calculus and the figure of the earth.

Shortly after his return to Sweden he was appointed professor of mathematics; and being thwarted in his project of teaching the philosophy of Wolf, which was supposed to be in some respects at variance with the doctrines of Christianity, he devoted himself the more ardently to the immediate duties of his professorship. He numbered among his pupils Stroemer, Wargentin, Melanderheim, and Mallet; and at the same time he contributed greatly by his writings to the improvement of mathematical science.

On the retirement of Dalin, the tutor of the Prince Royal of Sweden, afterwards Gustavus III., Klengenstierna was chosen to fill his post; he acquitted himself in the performance of this important duty with great success; and, as a recompence of his zeal, he received the title of Councillor of State, and was made a Knight of the Polar Star. On the termination of this public duty, Klengenstierna, feeling his health decline, quitted the court and passed several years in strict retirement. The Academy of Sciences at St. Petersburg having however offered a prize for the best essay on the means of correcting or diminishing the chromatic and spherical aberrations of light in refracting telescopes, he once more exerted himself; and, having collected his various papers on optics, he composed from them a general theory with relation to

the proposed subject, which he sent to the Academy, when the members of that body unanimously awarded him the sum of one hundred ducats. This work, which was entitled 'Tentamen de definiendis et corrigendis aberrationibus radiorum luminis sphericis refracti, et de perficiendo telescopio dioptrico,' was published at St. Petersburg in 4to in 1762.

While the improvement of refracting telescopes engaged the attention of mathematicians it happened that Dollond, in England, proposed objections to an assumption of Euler, that when light passes from air to glass and from air to water, the logarithms of the refractions of the mean refrangible rays are proportional to the logarithms of the refractions of the least refrangible rays; and assumed as a principle deduced from the experiments of Newton, that with a prism of glass contained in a prism of water, a constant ratio subsisted between the differences of the sines of the refractions of the red and violet rays in passing from air into the first medium, and from that medium into the second. This principle, and the accuracy of Newton's experiment on which it was founded, were impugned by Klengenstierna, who, from his own experiments, found that the light emergent after the refractions was affected with colour, under the circumstances in which Newton supposed that it would be wholly free from it. In 1754 he transmitted to Dollond an account of his experiments, together with some investigations relating to the dispersions of heterogeneous light in lenses; and these papers induced that distinguished artist to have again recourse to experiments with a view of discovering more precisely the phenomena of refraction. It was in the prosecution of these experiments that Dollond discovered that combination of lenses of flint and crown-glass by which the dispersions of light have been so nearly corrected in optical instruments.

Klengenstierna published in Latin an edition of Euclid's 'Elements,' a translation in Swedish of Mueschenbroek's 'Physics,' and two discourses in Swedish, which were delivered before the Academy of Stockholm: one of these is an eulogy on the mechanician Polhen, and the other relates to some electrical experiments which had been made at that time. He was early made a member of the Royal Society of Upsal, and he was afterwards received in the Academy of Sciences at Stockholm. He was elected a Fellow of the Royal Society of London in 1780, and in the 'Philosophical Transactions' for 1781 there is a paper by him on the quadrature of hyperbolic curves. Klengenstierna died October 28th, 1785.

KLOPSTOCK, FRIEDRICH GOTTLIEB, was born in 1724, of respectable parents, at Quedlinburg, at the gymnasium of which place he received his early tuition. In his sixteenth year he went to the school at Naumburg, where his poetical character was first developed. Here he perfected himself in the ancient languages, and even at this early age resolved to compose a long epic poem, though he had not yet made up his mind as to the subject. At first he thought of making the emperor Henry I., commonly called 'the Fowler,' the hero of his work, and some odes by him on this sovereign show that he was then uppermost in his mind. In 1745 he studied theology at Jena, where he seems to have decided on making the Redeemer the subject of his epic, for it was then that he projected the first canto of his 'Messiah,' and in 1748 the first three cantos appeared. The excitement created by this poem was surprising; some regarded him as an ectype of the ancient prophets, while others deemed his poetical treatment of so sacred a subject profane and presumptuous.

After the publication of the first portion of his poem Klopstock went to Langensalza to superintend the education of the children of a relation named Weiss, with whose daughter he fell in love, but without a return of his passion. This lady was the 'Fanny' of his odes. Bodmer, the Swiss poet, invited him to Switzerland, where his poem had made a great impression. In Switzerland he was received with a reverence that bordered on adoration (1750). While in that country his mind seems to have taken a patriotic tendency: the ancient Hermann (the Arminius of Tacitus) became his favourite hero, whose deeds he afterwards celebrated in some dramatic works. In Denmark the minister Bernstorff had become acquainted with the three cantos of the 'Messiah,' and Klopstock was offered a pension of 400 dollars on condition of coming to Copenhagen, and there finishing his poem. He set off in 1751, travelled through Brunswick and Hamburg, and at the latter place formed an intimacy with Margaretha Moller, daughter of a respectable merchant. At Copenhagen he was received by Bernstorff with the greatest respect, and introduced to the king, Frederick V., whom he accompanied on his travels. In 1754 he went to Hamburg, and there married his beloved Margaretha, who in 1758 died in childbed. From 1759 to 1763 he lived alternately in Brunswick, Quedlinburg, and Blankenburg, but afterwards returned to Copenhagen. He composed in 1764 his drama 'Hermannschlacht' (the battle of Arminius), the subject of which is the defeat of the Roman general Varus by the ancient Germans, and which is scarcely so much a drama, as a lyric poem in a dramatic form. His other dramas are of a similar character. In 1771 he left Copenhagen and settled at Hamburg, where he completed his 'Messiah,' and in 1792 married a second wife. He died in 1803.

Though Klopstock is still read and admired as a classic author, that adoration which was paid him has long since evaporated, and many have questioned whether he was a poet at all in the genuine sense of the word. Both in his 'Messiah' and his odes he is dignified

and sublime, but his rhapsodical manner contrasts strangely with the pedantry which is always apparent. Goethe, in his conversations with Eckermann, expressed his opinion that German literature was greatly indebted to Klopstock, who was in advance of his times, but that the times had since advanced beyond Klopstock. The young Hardenberg (who wrote under the name of 'Novalis') has happily said that Klopstock's works always resemble translations from some unknown poet, done by a clever but unpoetical philologist. Notwithstanding the grandeur of his 'Messiah,' it is exceedingly tedious to read; and even at the time of Klopstock's greatest popularity this seems to have been felt, for Lessing (his contemporary) observes, in an epigram, that everybody praises Klopstock, but few read him. His odes are valued by his own countrymen more than his epic, and some are truly sublime; but the construction of the language is so singular, and the connection of the thoughts so often non-apparent, that these odes are reckoned among the most difficult in the language.

* KMETY, GENERAL GEORGE, was born in 1810 at a village in Gómoror county, Hungary, where his father was a protestant clergyman. He was intended for a learned profession, and studied at the protestant college at Eperies, and afterwards at the protestant lyceum at Presburg. Having by a mistake been disappointed in receiving a German scholarship, to which he was entitled, he went to Vienna, and entered the army as a soldier. He had become a commissioned officer in the Austrian army when the Hungarian war of independence broke out in 1848. He then joined his countrymen, and distinguished himself by his bravery and activity. After the surrender of the army by Görgei, he escaped into Turkey, where he adopted the Mussulman religion, entered the Turkish army, and received the name and title of Ismail Pasha. He was attached to the army of Asia Minor, and he commanded the Turkish troops in the great battle which was fought with the Russians in defence of Kara. The conflict lasted seven hours and a half, during which General Kmetz with the Turkish soldiers fought with the most impetuous and determined bravery, and materially contributed to the repulse of the Russian army on that occasion.

KNELLER, GODFREY, was born in 1648, in the city of Lübeck, and received his first instruction in the art of painting in the school of Rembrandt. He afterwards became a pupil of Ferdinand Bol. Having acquired sufficient acquaintance with his profession to qualify him to travel with advantage, he went first to Rome and afterwards to Venice, where he painted several portraits of noble families, and some historical pictures, with such success as to gain him considerable reputation, even in Italy. Leaving Venice, he went to Hamburg, where he met with extraordinary encouragement, and lastly came to London. Being patronised by the Duke of Monmouth, he was introduced to King Charles II., whose portrait he painted several times. The death of Sir Peter Lely leaving him without a competitor, the remainder of his life was a career of fame and fortune. He had incessant employment, and was distinguished by many public marks of honour. He was state painter to Charles II., James II., William III., Queen Anne, and George I. The Emperor Leopold made him a Knight of the Roman Empire, the Grand Duke of Tuscany asked for his portrait to place it in the Gallery at Florence, and his works were celebrated by the first poets of his time.

Kneller had much of the freedom of Vandyck, but less nature. His outline is bold, his attitudes are easy and not without dignity; his colouring is lively, the air of his heads generally graceful, and there is a pleasing simplicity in his portraits combined with a considerable degree of elegance. But there is also a monotony in the countenances and a want of spirit in his figures. Thus the beauties of the court of William III., painted by order of the queen, are very inferior and tame in comparison with Sir Peter Lely's beauties of the court of Charles II. In the collection of the Marquis of Bute at Luton House there is a portrait of Sir John Robinson by Kneller, which, says Dr. Waagen, is far more elevated and free in the conception than usual, more carefully finished, and so warm in the colouring that we recognise the scholar of Rembrandt. Sir Godfrey died in 1726, at the age of seventy-eight.

KNIBB, REV. WILLIAM, Baptist missionary, was born at Kettering in Northamptonshire about the commencement of the present century. In due time he was apprenticed to a printer at Bristol, where he early joined a Baptist church. His elder brother, Thomas, left England in December 1822, to undertake the charge of a school connected with one of the Baptist mission churches in Jamaica, where he died in May 1824. The intelligence of his death so excited the zeal of William Knibb, that he offered himself to go out to supply the place of his deceased brother; and, his offer being accepted, he sailed with his wife in November 1824. Towards the close of 1829 he removed, in consequence of delicate health, from Kingston to the north-western part of the island, where he took charge of the Ridge-laud mission, in connection with Savanna-la-Mar; and subsequently became pastor of the mission church at Falmouth. Shortly after Mr. Knibb's settlement at Falmouth he was brought into painful notoriety in consequence of the breaking out of an alarming spirit of insurrection among the slave population. A notion had by some means been widely circulated among the negroes to the effect that the king of England had determined to emancipate them from slavery, and that the 'free paper,' as they termed the supposed authority for their liberation, had been actually sent to the West Indies, but had been

suppressed or held back through the influence of the slaveowners; and, in consequence of this belief, the slaves upon several estates in Jamaica avowed, towards the latter end of December 1831, their determination to do no work after Christmas. When the missionaries became acquainted with this state of things, they endeavoured to remove the erroneous impression from the minds of such of the negroes as were under their influence, and were so active in their measures as to lead to a report among the disaffected slaves that the white people had bribed Mr. Blyth (a Presbyterian missionary) and Mr. Knibb to withhold their freedom. Insurrectionary movements were, in spite of all the efforts of the missionaries, actually commenced by the negroes, although the interposition of Mr. Knibb, who possessed great influence over the slaves, prevented their rising upon many estates. Notwithstanding this fact both he and his brother missionaries were regarded with great jealousy by the planters, overseers, and others in the slave-holding interest, whose enmity had been excited by their efforts for ameliorating the condition of the negroes, and by the part they had taken in exposing many cases of gross cruelty and oppression. On the 1st of January 1832 Mr. Knibb was compelled, without regard to his sacred office, to join the militia, and while on service he was treated with marked indignity. Having, a few days later, memorialised the governor for exemption from military service, he was arrested, and debarred from any communication with his family, upon the plea of alarming intelligence by which, it was pretended, the missionaries were implicated in the rebellion. He was released in February, no evidence being obtained to support a criminal prosecution; but in March fresh steps were taken to bring him to trial, though on the day appointed for trial the proceedings were abandoned upon the appearance of about three hundred witnesses who came forward, upon a few hours' notice, in his defence.

During the continuance of disturbances in the island Mr. Knibb's chapel and mission premises at Falmouth were razed to the ground by the men of the St. Ann's regiment, who had used them as barracks for a time; and as similar outrages had been committed on other missionary stations, it was determined that Mr. Knibb, accompanied by Mr. Burchell, should visit England to explain the circumstances of the mission. They accordingly reached England in the beginning of June. Down to that time the Baptist Missionary Society had carefully avoided taking any part in the question of emancipation, regarding it as one of the political questions on which it was desirable to observe a rigid neutrality. Mr. Knibb was accordingly cautioned not to commit the society by his proceedings; but, warmed with enthusiasm excited to the highest pitch by his personal knowledge of the horrors of the system, he boldly declared that the society's missionary stations in Jamaica could no longer exist without the entire and immediate abolition of slavery; and, feeling that the time for neutrality was passed, he declared his determination at the annual meeting of the society on the 21st of June, to avow this at the risk of his connection with the society. Mr. Knibb carried the meeting, and subsequently the feelings of the greater part of the country with him, and his stirring appeals had no unimportant share in bringing about the Emancipation Act of 1833.

In the autumn of 1834 Mr. Knibb returned to Jamaica, and in the following year the building of a new chapel at Falmouth, and of a new Lancastrian school for children of all denominations at Trelawney, was commenced under his superintendence. The same strong feeling which had led Mr. Knibb to take so determined a part in promoting the abolition of slavery, induced him now to expose the failure of the apprenticeship system established by the Act of 1833, as a means of preventing the evils anticipated from sudden emancipation. He showed that many of the worst features of slavery were continued under the guise of apprenticeship, and induced some planters to anticipate the course of law by immediate emancipation. After the complete emancipation of the slaves or apprentices, on the 1st of August 1838, Mr. Knibb purchased, by the aid of English friends, a tract of ground for the purpose of furnishing independent residence and occupation for the liberated negroes; and he erected a normal school at the village of Kettering in Trelawney, for training native and other schoolmistresses for both Jamaica and Africa. In 1842, in consequence of the prosperous state of the mission churches in Jamaica, it was determined by the missionaries and congregations to separate themselves from the Baptist Missionary Society, so far as any dependence upon the society's funds was concerned; and in the same year Mr. Knibb visited England to promote the establishment of a theological seminary in connection with the native mission to Africa, which had been commenced about two years before through his exertions. In the early part of 1845 he again visited England, to obtain pecuniary aid for the negroes connected with the Baptist churches in Jamaica, and to expose a new system of taxation which bore upon the liberated negro labourers with extreme severity. Having succeeded in obtaining both sympathy and pecuniary assistance, he returned to Jamaica in July 1845. In the following November he was seized with yellow fever, and died, after an illness of only four days, on the 15th of that month, at the village of Kettering. Though his funeral took place on the following day, such was the respect entertained for his memory that not less than 8000 persons are said to have assembled on the occasion.

KNIGHT, RICHARD PAYNE, eldest son of the Reverend

Thomas Knight, of Wormesley Grange, in the county of Hereford, was born in 1750. He was a weak and sickly child, and his father did not send him to school, or suffer him to learn either Greek or Latin at home. Soon after his father's death, which took place in 1764, he was sent to a grammar-school in the neighbourhood, where he made a rapid progress in the Latin language. After leaving school he did not go to a university, but at the age of eighteen he commenced the study of Greek, which he pursued with great diligence, and which became one of the chief occupations of his life. Shortly afterwards he visited Italy, principally on account of his health; and there he seems to have formed the taste for the fine arts, and especially for the productions of the Greek sculptors, which was his most prominent characteristic. Subsequently to his father's death he inherited the large estate of Downton, near Ludlow, from his grandfather, on which, after his return from Italy, he built a mansion, and he devoted much time to improving and ornamenting his grounds. In 1780 he was elected to serve in parliament for the borough of Leominster, and in the following parliament of 1784, for the borough of Ludlow, for which he continued to sit until the year 1806, when he retired from parliament. While a member of the House of Commons he acted with Mr. Fox, but he never took any part in debate, nor did he ever interest himself about politics. In 1814 he was appointed a trustee of the British Museum, as the representative of the Townley family.

Early in his life he commenced the formation of a collection of antiques and other works of art, to which his large fortune enabled him to make constant additions. It consisted principally of ancient bronzes and Greek coins; and it was preserved in his London house in Soho Square, which contained a large room fitted up for the purpose. He bequeathed his collection (the value of which was estimated at 50,000*l.*) to the British Museum. He had originally intended to bequeath it to the Royal Academy. The bill legalising the acceptance of this collection by the trustees of the British Museum received the royal assent on the 17th of June 1824. Mr. Knight died in his house in London, on the 24th of April 1824, and he was buried at Wormesley church, in Herefordshire.

Mr. Payne Knight began at an early age to admire the remains of Grecian art, and hence in his studies of Greek literature his attention was mainly directed to those subjects which illustrate Greek sculptures and coins, namely, mythology and the archaic Greek language. Accordingly his first work was 'An Account of the Remains of the Worship of Priapus lately existing at Isernia, in the Kingdom of Naples; to which is added a Discourse on the Worship of Priapus, and its connexion with the Mystic Theology of the Ancients,' 4to, 1786. (Distributed by the Dilettanti Society.) This illustration of the obscene worship of Priapus was severely censured by the author of the 'Pursuits of Literature;' but although it may be doubted whether the subject was worthy of investigation, it is certain that Mr. Knight had no other object in view than the purely scientific one of elucidating an obscure part of the Greek theology. His next production was 'An Analytical Essay on the Greek Alphabet,' 4to, London, 1791. This work, which was reviewed by Porson in the 'Monthly Review' for 1794 (see his article reprinted in Porson's 'Tracts,' p. 108, 'Museum Criticum,' vol. i., p. 489), was chiefly remarkable for an exposure of the forgery of certain Greek inscriptions which Fourmont professed to have found in Laconia. These inscriptions had deceived the most eminent scholars, among whom it is sufficient to name Winckelmann, Villoison, Valckenaer, and Heyne; and their genuineness was first questioned by Payne Knight, who supported his opinion with an elaborate argument: their spuriousness is now universally admitted. (See Boeckh, 'Corp. Inscript. Græc.,' vol. i., pp. 61-104, whose dissertation has completely exhausted the subject.) Mr. Knight next attempted poetry, for which the character of his mind did not at all fit him. In 1794 he published the 'Landscape,' a didactic poem, in three books, addressed to Uvedale Price, Esq. This poem contains many precepts, marked by sound judgment and good taste, on the subject to which it relates, but there is no largeness of view or depth of thought; at the end are some sagacious remarks on the French revolution, the event of which was still undetermined. Mr. Knight published three other metrical works at subsequent periods of his life. The first was a didactic poem, in six books, entitled 'The Progress of Civil Society,' 4to, London, 1796, now only known by the witty parody in the 'Antijacobin' (supposed to have been written by Mr. Canning). The second was 'A Monody on the Death of the Right Honourable C. J. Fox,' 8vo, London, 1806-7. The third was entitled 'Alfred, a Romance in Rhyme,' 8vo, London, 1823.

In 1805 Mr. Payne Knight published 'An Analytical Enquiry into the Principles of Taste,' 8vo, London, which passed through several editions. This work is characterised by acuteness of thought, and is the only production of Mr. Knight's which is interesting to the general reader, but it would now probably attract no notice if it were published as an original work. It was reviewed with some severity in the 'Edinburgh Review' for January, 1806. (See also some remarks on it in Mackintosh's 'Life,' vol. i. p. 371.) Mr. Knight afterwards contributed to the 'Edinburgh Review' (Number for July, 1809) a critique of Falconer's 'Strabo,' a work published at the Clarendon Press. In the following year Mr. Copleston, then a tutor of Oriel College, Oxford, and afterwards Bishop of Llandaff, published a defence

of the University of Oxford against the strictures of the 'Edinburgh Review.' This defence related not only to Mr. Knight's critique of Falconer's 'Strabo,' but also to passages in other articles ascribed to Mr. Playfair and Mr. Sidney Smith. An article in reply, contributed by the three reviewers, appeared in the 'Edinburgh Review' for April, 1810: Mr. Knight's share of it extends from p. 169 to p. 177. Mr. Copleston afterwards rejoined, and the controversy with Mr. Knight ended in a grammatical discussion totally foreign to the question at issue. In 1809 were published 'Specimens of Ancient Sculpture, selected from different Collections of Great Britain, by the Society of Dilettanti,' fol., and a second volume was published in 1835. This magnificent work was chiefly due to Mr. Knight's industry and taste; the subjects were chosen by him, and he wrote the prefaces and descriptions of the plates.

In 1816 Mr. Knight was examined by a select committee of the House of Commons on the Elgin Marbles. The evidence which he gave upon this occasion, while like all that he published quite devoid of any profundity, was not marked with his usual good taste as to the merits of the remains of Greek art; an examination of it, written in a hostile spirit, may be seen in the 'Quarterly Review,' vol. xiv., pp. 533-543. Mr. Knight distributed a short Answer to the 'Quarterly Review' among his literary friends in explanation of the parts of his evidence which he considered had been misrepresented. In 1820 Mr. Knight published an edition of the 'Iliad' and 'Odyssey,' with prolegomena. His object in this edition was to restore the text of Homer to its original state. He rejected the Wolfian hypothesis concerning the origin of the Homeric poems, and supposed the 'Iliad' and 'Odyssey' to have been each the work of a single poet; the poet of the 'Odyssey' being posterior to the poet of the 'Iliad.' The process by which he attempted to restore the text of these two poems to their original state was twofold: 1, the remodelling of the language, by the introduction of forms disused in later times, and of the ancient letter styled the 'digamma;' 2, the rejection of verses interpolated by later rhapsodists and poets. It will be enough to say that the work is not now regarded by scholars as of any authority. After Mr. Knight's death his catalogue of his coins was published by the trustees of the British Museum. ('Nummi Veteres,' &c., 4to, London, 1830). Besides the works above mentioned, Mr. Knight wrote several papers in the 'Classical Journal' and the 'Archæologia' (see vols. xv. 393, xvii. 220, xix. 369): the article on the works and life of Barry, in the 'Edinburgh Review' for August 1810, is also by him. To these may be added a paper on the 'Homeric Palace,' published after his death in the 'Philological Museum,' vol. ii., pp. 645-49. He likewise first published the celebrated 'Elean Inscription,' concerning which see Boeckh, 'Corp. Inscript. Gr.,' No. 11.

KNIGHT, THOMAS ANDREW, brother of the subject of the preceding article, was born on the 10th of October 1758. The grandfather of these eminent men had amassed a large fortune as an iron-master at a period long before steam machinery was introduced in the smelting and manufacture of iron. When young, Thomas Knight's education was so much neglected, that when, at the age of nine years, he was sent to school at Ludlow, he was scarcely able to do more than read. But the days of his childhood had not been passed without employment. He had a great turn for the observation of natural phenomena, and having been left to occupy himself in the country in what way he pleased, he had already formed a close practical acquaintance with such plants and animals as Herefordshire could furnish. Eventually he graduated at Balliol College, Oxford, and subsequently occupied himself with researches into various points of vegetable and animal physiology. One of the most remarkable of his early investigations was contained in a paper read before the Royal Society in 1795, upon the inheritance of disease among fruit-trees, and upon the propagation of debility by grafting. The county of Hereford had long been celebrated for the produce of its orchards, and the cider made therefrom was in high esteem; but towards the latter part of the last century the trees of the most esteemed sorts became gradually less productive, their vitality being nearly exhausted. Still the old practice of grafting young stocks with the debilitated shoots of these trees generally prevailed, till Mr. Knight, after a long course of interesting experiments, satisfied himself that there is no renewal of vitality by the process of grafting, but merely a continuation of declining life, and that young grafted stocks soon became as much diseased as the old parent trees. He then commenced a course of experiments by fertilising the blossoms of some hardy crabs or apples with the pollen taken from the flowers of the most celebrated dessert and cider fruits, and sowing the seeds thus artificially impregnated. From that time Mr. Knight was looked up to in this country as a vegetable physiologist of a high order; a character which he ably sustained by various experimental researches into vegetable fecundation, the ascent and descent of sap in trees, the phenomena of germination, the influence of light upon leaves, and a variety of similar subjects. In 1797 he published a small work called 'A Treatise on the Culture of the Apple and Pear, and on the Manufacture of Cider and Perry,' in which he recommends raising new kinds from seed, and suiting the sorts produced to the peculiarities of soil and climate, which are found to have so great an influence on the quality of cider. Mr. Knight did not confine his experiments to the improvement of the apple only, but he raised many pears most

valuable for the dessert, and so hardy as not to require the warmth and shelter of walls, and consequently capable of being cultivated by every farmer and cottager in the country. His seedling plums, strawberries, nectarines, and potatoes are also of great value, and an important addition to the luxuries and necessities of life.

The great object of this distinguished man seems to have been in all cases utility. It was chiefly to questions which he thought likely to lead to important practical results that his attention was directed; and the numerous papers communicated by him to the 'Transactions' of the Horticultural Society, in the chair of which he succeeded his friend Sir Joseph Banks, have all this distinguishing feature. No one who has traced the progress of horticultural skill for the last half century, can be ignorant that it is very largely, if not mainly due to the writings and practice of Mr. Knight: he was probably the best practical gardener of his day. It is however not a little remarkable that with so very extensive a knowledge of the facts of vegetable physiology, he should have been so unfortunate as he certainly was in many of his explanations of them. This arose no doubt from his unacquaintance with vegetable anatomy, and consequently with the minute means by which Nature brings about her results in organised matter. Mr. Knight was also a close observer of the habits of animals, and one of his last communications to the Royal Society was on the subject of animal instinct. He died in London on the 11th of May 1838, in the eightieth year of his age.

KNIGHTON, HENRY, an English historian of the close of the 14th and beginning of the 15th century, was a canon-regular of Leicester Abbey. The time neither of his birth nor death is known. His 'Compilatio de Eventibus Angliæ, à tempore Regis Edgari usque mortem Regis Ricardi Secundi,' was published by Twysden in the 'Decem Scriptores,' fol., London, 1652, cols. 2311-2741. (Selden's notice of him, prefixed to the *Decem Scriptores*, pp. 46, 47; Tanner, *Bibl. Brit. Hib.*, p. 458.)

KNOLLER, MARTIN VON, a distinguished German painter of the 18th century, was born in the village of Steinach, in the Tyrol, in 1725. His father appears to have been a poor painter of some sort, and he intended his son to follow his own pursuit. He was however in such circumstances as to make it necessary for his son to perform the menial work of the house, which Martin appears to have found particularly distasteful. The boy accordingly ran away from his home, and found shelter in the house of Hofkammerath von Hornmayr at Innsbruck, who, when he had heard the boy's story, let his father know of his safety, and placed him with a painter of the name of Pögel, who thus became Knoller's first master, though he can have had but the slightest influence upon him, if any at all. Martin's father however required his son's services in every way, and he was forced to return home, where he divided his time between the pursuit of his art, in assisting his father, and in the performance of menial domestic offices. Such was the state of affairs when circumstances brought the painter Paul Troger, on his return to Vienna, to the village of Steinach, where he saw and admired some of the extraordinary productions of Knoller, then twenty years of age. Troger perceived the lad's ability, and offered to take him with him to Vienna. Young Knoller went with his patron, and in eight years from that time he had not a superior of his own age in the Austrian dominions. Already, in the years 1743-50, he assisted Troger in the frescoes of the cathedral church of Brixen; and in 1753 he obtained the great prize of the Austrian Academy for historical painting. In 1753 Knoller returned to the Tyrol, and in the following year painted in fresco the church of Anras so much in the manner of Troger that it might pass for the work of that master. Troger, though correct, was cramped and formal in design and sharp in his outlines. In 1755 Knoller visited Rome, and greatly improved his style during the three years he spent in that city. From Rome he was invited to Naples by Count Firmian, the Austrian ambassador at Naples, who employed him much in that city, and in the decoration of his palace at Milan. Knoller visited Rome several times subsequently, and contracted a close friendship with Winkelmann and with Mengs. In 1764 he finished one of his principal works, the frescoes of the church of Volders near Hall, in the Tyrol, consisting of passages from the life of San Carlo Borromeo. In 1765 he returned to Milan to his former patron, Count Firmian, whose esteem and patronage induced Knoller to make Milan his head-quarters; and he there married in 1767 the daughter of a merchant, by whom he had nine children.

Knoller painted many works in Milan in oil and in fresco, the best of which is a ceiling in the palace of the Prince Belgiojoso, representing the apotheosis of one of his ancestors. The palace of the Count Firmian was rich in Knoller's works. His principal German works are the frescoes of the convent-church of Ettal in the Bavarian Alps; and the seven cupolas of the church of Neresheim in Würtemberg, painted in 1770-75, for which he received 22,000 florins. He painted a large fresco, 110 by 33 feet, in the town-hall at Munich, representing the Ascension of the Virgin; and there are altar-pieces by him in several churches in the south of Bavaria. He was much engaged also at Vienna, but chiefly in portrait-painting: he was there ennobled, with the title of 'von,' by Maria Theresa. There are many of his works in the Tyrol, at Innsbruck, Botzen, and other places. The church of his native place, Steinach, possesses three altar-pieces by Knoller. He died in 1804.

Knoller was gay in colouring, and correct and vigorous in design, and his works are chiefly characterised for their physical qualities—dramatic and effective composition, strong expression, and vigorous and uncommon attitudes. His sphere was almost exclusively the practical part of art; the true historical and æsthetical he hardly approached, but this might be said of many more eminent painters. A life of Knoller was published in the 'Beiträge zur Geschichte und Statistik von Tyrol,' for 1831.

*KNOWLES, JAMES SHERIDAN, dramatist, was born in 1784 at Cork in Ireland, where his father, James Knowles, was a teacher of elocution. In 1792 James Knowles removed with his family to London. Sheridan Knowles's first attempt to construct a play was made at the age of twelve years for a company of boys. At fourteen he wrote an opera called 'The Chevalier de Grillon' and 'The Welsh Harper,' a ballad. These were followed by a tragedy entitled 'The Spanish Story,' and by 'Hersilia,' a drama. None of these dramatic works have been preserved. About this time he was introduced to Hazlitt, who treated him with much kindness, assisted him in his dramatic studies, and became, as Knowles expresses it, his 'mental father.' About 1798 Sheridan Knowles removed to Dublin, where he resided with some relatives, and having resolved to make trial of the stage as a profession, came out at the Crow-Street Theatre, but was not favourably received. He afterwards joined a theatrical company at Waterford, in which he became an actor and singer. In the winter of 1809 Edmund Kean became an actor in this company, and Knowles wrote a play in blank verse called 'Leo, or the Gipsy,' in which Kean played the principal character with great success. This play has not been preserved, but Barry Cornwall, in his 'Life of Edmund Kean,' has given extracts from it. While at Waterford, Sheridan Knowles published by subscription a small volume of poetical 'Fugitive Pieces.' He afterwards removed to Belfast, where he became a teacher of elocution, and produced with success at the Belfast Theatre a play called 'Brian Boroihme.' This was followed by his tragedy of 'Caius Gracchus,' which was performed February 13th 1815 at the same theatre with very great success. His next tragedy, 'Virginus,' was brought out at the Glasgow Theatre, where it was played fifteen nights. It was performed in London at Covent Garden Theatre in 1820, and established his reputation as a dramatic writer. 'Caius Gracchus' was performed at Drury Lane Theatre in 1824, and 'William Tell' at the same theatre in 1825. In these three tragedies Macready acted Virginus, Caius Gracchus, and William Tell. 'The Beggar's Daughter of Bethnal Green' (1828) was altered and brought out at the Victoria Theatre in 1834, Sheridan Knowles himself playing Lord Wilford. 'Alfred the Great' was performed at Drury Lane in 1831, and 'The Hunchback' at Covent Garden in 1832, the author taking the character of Master Walter and Miss Fanny Kemble Julia. 'The Wife, a Tale of Mantua,' was performed at Covent Garden in 1833, with Knowles himself as Julian St-Pierre. In 1834 he revisited his native city of Cork, and in 1835 paid a visit to the United States of America, where he was received, as well as in Ireland, with flattering demonstrations of respect. In 1836 'The Daughter' was performed at Drury Lane, and in 1837 'The Love-Chase' at the Haymarket. Afterwards came out 'Woman's Wit,' Covent Garden, 1838; 'The Maid of Mariendorp,' Haymarket, 1838; 'Love,' Covent Garden, 1839; 'John of Procida,' Covent Garden, 1840; 'Old Maids,' Covent Garden, 1841; 'The Rose of Arragon,' Haymarket, 1842; and 'The Secretary,' 1843. In 1847 he published 'Fortescue,' 3 vols. 8vo., and 'George Lovell,' 3 vols. 12mo., two novels, which did not add to his reputation. In 1849 the government rewarded his services to literature by a pension of 200l. a year. He has since published 'The Rock of Rome, or the Arch-Heresy,' and 'The Idol demolished by its Own Priest,' two works of controversial divinity. He has also become a Baptist minister, and several of his sermons have been printed. His 'Dramatic Works' have been collected and published in 3 vols. small 8vo.

KNOX, JOHN, the son of obscure parents, was born in 1505: there is some doubt respecting his birthplace, which was probably the village of Gifford in East Lothian, although it has been asserted that he was born at Haddington. His education was more liberal than was then common. In his youth he was put to the grammar-school at Haddington, and about 1524 removed to the University of St. Andrews, where the learning principally taught was the philosophy of Aristotle, scholastic theology, civil and canon law, and the Latin language; Greek and Hebrew were at that time little understood in Scotland, and Knox did not acquire the knowledge of them until somewhat later in his life. "After he was created Master of Arts he taught philosophy, most probably as an assistant or private lecturer in the university, and his class became celebrated." "He was ordained a priest before he reached the age fixed by the canons of the church, which must have taken place previous to the year 1530, at which time he had attained his 25th year, the canonical age for receiving ordination." (M'Crie.) His first instruction in theology was received from John Major, the professor of theology in the university, but the opinions founded upon it were not long retained; the writings of Jerome and Augustine attracted his attention, and the examination of them led to a complete revolution in his sentiments. It was about the year 1535 that his secession from Roman Catholic doctrines and discipline commenced, but he did not declare himself a Protestant until 1542.

The Reformed doctrine had made considerable progress in Scotland before this time. Knox was not the first reformer, there were many persons, "earls, barons, gentlemen, honest burghers, and craftsmen," who already professed the new creed though they durst not avow it; it was to the avowal, extension, and establishment of the Reformed religion that his zeal and knowledge so powerfully contributed. His reprehension of the prevalent corruptions made him regarded as a heretic; for which reason he could not safely remain in St. Andrews, which was wholly in the power of Cardinal Beaton, a determined supporter of the Church of Rome, and he retired to the south of Scotland, where he avowed his apostacy. He was condemned as a heretic, degraded from the priesthood, and it is said by Beza that Beaton employed assassins to waylay him. He now for a time frequented the preaching of the Reformed teachers, Williams and Wishart, who gave additional strength to opinions already pretty firmly rooted; and having relinquished all thoughts of officiating in the Roman Catholic Church, he became tutor to the sons of Hugh Douglas of Langniddrie, a gentleman of East Lothian, who had embraced the Reformed doctrine. After the murder of Cardinal Beaton, Knox removed with his pupils from Langniddrie to St. Andrews (1547), where he conducted their education in his accustomed manner, catechising and reading to them in the church belonging to the city. There were many hearers of these instructions, who urged him and finally called upon him to become a public preacher. Diffident and reluctant at first, upon consideration he consented to their request. In his preaching, far more than the reformed teachers who had preceded him, he struck at the very foundations of popery, and challenged his opponents to argument, to be delivered either in writing or from the pulpit, and so successful were his labours that many of the inhabitants were converted to his doctrines.

It was not long before an event took place by which his efforts received a temporary check. The murder of Cardinal Beaton had given great offence, and created great excitement through the kingdom. It was a severe blow to the Roman Catholic religion and the French interest in Scotland, both of which he had zealously supported, and vengeance was loudly called for upon the conspirators by whom he had been murdered. These conspirators had fortified St. Andrews, and the art of attacking fortified places was then so imperfectly understood in Scotland that for five months they resisted the efforts of Arran, the Regent. From their long wars in Italy and Germany, the French had become as experienced in the conduct of sieges as the Scotch were ignorant. The French were allies of Scotland; to France therefore Arran sent for assistance. About the end of June 1547 a French fleet, with a considerable body of land forces, appeared before the town. The garrison capitulated, and Knox, among many others, was taken prisoner, and conveyed to Rouen, where he was confined on board the galleys. After nineteen months' close imprisonment he was liberated, with his health greatly injured by the rigour with which he had been treated (1549).

Knox now repaired to England, and though he had never received ordination as a Protestant, Cranmer did not hesitate to send him from London to preach in Berwick. In Berwick and the North of England he followed his arduous undertaking of conversion until 1551, when he was made one of King Edward's chaplains, with a salary of 40*l.* a year. While his friends in the English administration offered him further preferment, which he declined, his enemies brought charges against him before the council, of which he was soon afterwards acquitted. He was in London at the time of King Edward's death, but thought it prudent to fly the kingdom as soon as Mary's policy towards the Protestants became apparent. In January 1554, he landed at Dieppe; from Dieppe he went to Geneva; and from Geneva to Frankfurt, where Calvin requested him to take charge of a congregation of English refugees. In consequence of some disputes he returned from Frankfurt to Geneva, and, after a few months' residence there, to Scotland, where he again zealously promulgated his doctrines. The English congregation at Geneva having appointed him their preacher, he thought right to make another journey to the Continent (1556), which he quitted finally in 1559. During these the quietest years of his life he published 'The First Blast of the Trumpet against the monstrous Regiment of Women,' in which he vehemently attacked the admission of females to the government of nations. Its first sentence runs thus: "To promote a woman to bear rule, superiority, dominion, or empire, above any realm, nation, or city, is repugnant to nature, contumely to God, a thing most contrarious to his revealed will and approved ordinance, and finally it is the subversion of all equity and justice." This inflammatory composition, as might have been expected, excited fresh hostility against its author. At the time of its publication both England and Scotland were governed by females; Mary of Guise, the queen-dowager of Scotland, was likewise regent of that kingdom, while the Princess Mary was heiress of its throne: and in England Mary was queen, and her sister Elizabeth the next in succession to the crown. It hardly admits of wonder then that when, in 1559, Knox was desirous of returning to England, Queen Elizabeth's ministers would not permit him to do so, and he was compelled to land at Leith.

The Protestants in Scotland were by this time nearly equal to the Roman Catholics, both in power and in number; but their condition had lately been changed somewhat for the worse. The queen-regent

who from motives of policy had found it desirable to conciliate and uphold them, from similar motives had become their opponent and oppressor; and many of the preachers of the 'Congregation' (the name by which the body of Protestants was then called) were summoned for various causes to take their trial. It was on a day not long previous to these trials that Knox returned to his country to resume the labours of his ministry; hearing of the condition of his associates, "he hurried instantly" (says Robertson, i. 375) "to Perth, to share with his brethren in the common danger, or to assist them in the common cause. While their minds were in that ferment which the queen's perfidiousness" [she had broken a promise to stop the trial], "and their own danger occasioned, he mounted the pulpit, and, by a vehement harangue, against idolatry, inflamed the multitude with the utmost rage." The indiscretion of a priest, who, immediately after Knox's sermon, was preparing to celebrate mass, caused a violent tumult. The churches in the city were broken open, altars were overturned, pictures defaced, images destroyed, and the monasteries levelled with the ground. The insurrection, which was not the effect of any concert or previous deliberation, was censured by the Reformed preachers; and it affixes no blame to the character of Knox. The queen-regent sent troops to quell this rebellion; troops were also raised by the Protestants, but a treaty was entered into before any blood was shed.

The promotion of the Reformation in his own country was now Knox's sole object: he was reinstated in his pulpit at St. Andrews, and preached there in his usual rough, vehement, zealous, and powerful manner, until the Lords of the Congregation took possession of Edinburgh, where he was immediately chosen minister. His efforts gave great offence and alarm to the Roman Catholic clergy, especially during a circuit that he made of Scotland. Armies were maintained and sent into the field by both parties, for treaties were no sooner made than they were violated; French troops again came to succour the Roman Catholic clergy; and to oppose them Knox entered into correspondence with Cecil, and obtained for his party the assistance of some forces from England. The 'Congregation' however had many difficulties and disasters to struggle with. A messenger whom they had sent to receive a remittance of money from the English was intercepted and rified; their soldiers mutinied for want of pay; their numbers decreased, and their arms were unsuccessful. Under these circumstances it required all the zeal and the courage of Knox to sustain the animation of his dispirited colleagues; his addresses from the pulpit were continual and persevering. As the treaty by which the civil war was concluded made no settlement in religion, the reformers found no fresh obstacle to the continuance of their efforts; and Knox resumed his office of minister in Edinburgh. In this year (1560) the queen-regent died, and in the following Queen Mary took possession of the throne of Scotland; her religious opinions were Roman Catholic, but she employed Protestant counsellors. The preaching of Knox and his denunciations of her religious practice attracted her attention. At different times he had interviews with her (which at first gave rise to much speculation), but neither her artifices produced much effect, nor his arguments; so stern was he, and so rough in his rebukes, that he once drove her into tears. At her instigation Knox was accused of treason, and was tried, but the whole convention of counsellors, excepting the immediate dependants of the court, pronounced that he had not been guilty of any breach of the laws (1563).

Knox continued his exertions, with difficulties of different kinds constantly besetting him. At one time he was prohibited from preaching, at another he was refused entrance into Edinburgh after a temporary absence, but on the whole his influence was little impaired, and his opposition to Popery successful. His health however was affected by continual exertion: in 1570 he was struck with apoplexy, from which he so far recovered as to renew his labours for more than a year; but in 1572 his exhausted constitution gave way, and he died on the 24th of November. He was buried in Edinburgh, in the church then called St. Giles's, now the Old Church.

Knox was twice married; first in 1553, to Marjory, daughter of Sir Robert Bowes; afterwards, in 1564, to Margaret Stewart, daughter of Lord Ochiltree; he had sons only by his first marriage; they all died without issue. He had three daughters by his second wife; the youngest, Mrs. Welch, appears to have been a remarkable person.

The doctrines of Knox were those of the English reformers, impregnated to a considerable extent with Calvinism. His opinions respecting the sacraments coincided with those of the English Protestants: he preached that all sacrifices which men offered for sin were blasphemous; that it was incumbent to make an open profession of the doctrine of Christ, and to avoid idolatry, superstition, and every way of worship unauthorised by the Scriptures; he was altogether opposed to Episcopacy. His views were more austere than those promulgated in England; and there can be little doubt that the present greater severity of the Scotch Presbyterians, compared with that of the English Protestants, is greatly attributable to this reformer.

The opposition of Knox as well to Episcopacy as to Papacy has caused his reputation to be severely dealt with by many writers of contrary opinions on these points. A most elaborate character of him has been drawn at some length by Dr. M'Crie, in his 'Life of Knox,' and though it may perhaps be well to inform the reader that Dr. M'Crie was a rigid Presbyterian, we think it on the whole a just representation.

We subjoin a brief summary of it: Knox possessed strong talents; was inquisitive, ardent, acute, vigorous, and bold in his conceptions. He was a stranger to none of the branches of learning cultivated in that age by persons of his profession, and he felt an irresistible desire to impart his knowledge to others. Intrepidity, independence, and elevation of mind, indefatigable activity, and constancy which no disappointments could shake, eminently qualified him for the post which he occupied. In private life he was loved and revered by his friends and domestics: when free from depression of spirits, the result of ill health, he was accustomed to unbend his mind, and was often witty and humorous. Most of his faults may be traced to his natural temperament and the character of the age and country in which he lived. His passions were strong, and as he felt he expressed himself without reserve or disguise. His zeal made him intemperate: he was obstinate, austere, stern, and vehement. These defects, which would have been inexcusable in most other persons, may be more easily forgiven in him, for they were among the most successful weapons in his warfare.

KNOX, REV. VICESIMUS, D.D., was born at Newington Green, Middlesex, December 8, 1752. His father was the Rev. Vicesimus Knox, LL.B., Fellow of St. John's College, Oxford, and head master of Merchant Taylors' School, London. Vicesimus Knox, the son, was also educated at St. John's College, Oxford, where he pursued his classical studies with great diligence, and became very skilful in Latin composition. Having taken his degree of B.A., and been elected to a Fellowship, he left the university, and in 1778 was elected master of Tunbridge School, Kent. He married about the time of his settling at Tunbridge, and his wife died in 1809, leaving two sons and a daughter. A short time after his marriage he received the degree of D.D. by diploma from the University of Philadelphia. After having been master of Tunbridge School thirty-three years he retired, and was succeeded by his eldest son. He was rector of Rumwell and Ramsden Crays in Essex, and minister of the chapelry of Shipbourne in Kent. He performed the duties of a parish priest nearly forty years with great regularity. In the latter part of his life he resided in London. He was much admired as a preacher, and frequently gave his aid in behalf of public charities by delivering a sermon. He died upon a visit to his son at Tunbridge, September 6, 1821.

Dr. Knox's chief works were—1, 'Essays, Moral and Literary,' 12mo, 1777, which came out anonymously, and met with so much success that he republished them in 1778, with additional essays, in 2 vols. 12mo—many additions have been since published; 2, 'Liberal Education, or a Practical Treatise on the Methods of acquiring Useful and Polite Learning,' 8vo, 1781, enlarged in 1785 to 2 vols. 8vo: this work was chiefly intended to point out the defects of the system of education in the English universities, and is said to have had some effect in producing a reformation; 3, 'Elegant Extracts in Prose,' 8vo; 4, 'Winter Evenings, or Lucubrations on Life and Letters,' 3 vols. 12mo, 1788; 5, 'Elegant Extracts in Verse,' 1790, 8vo; 6, 'Sermons intended to promote Faith, Hope, and Charity,' 1792, 8vo; 7, 'Elegant Epistles,' 8vo, 1792; 8, 'Family Lectures,' 8vo, 1794; 9, 'Christian Philosophy, or an Attempt to display the Evidence and Excellence of Revealed Religion,' 2 vols. 12mo, 1795; 10, 'Considerations on the Nature and Efficacy of the Lord's Supper,' 12mo, 1799. Dr. Knox published a few other minor works, occasional sermons and pamphlets.

Dr. Knox's writings were once much admired. His style has considerable neatness and elegance, but he has little originality or power of thought, and his popularity has for some years been gradually decreasing. The selections in the 'Elegant Extracts' were made with much taste and judgment. They were very useful works in their day, and had for many years a large circulation.

KOBELL, the name of several German and Dutch landscape painters, of whom the two following are the most distinguished:—

FERDINAND KOBELL was born at Mannheim in 1740, and was educated by his father with a view to his obtaining an honourable position in the civil service of the Electoral government, under which he himself held the place of hofkammerrath, or counsellor of the exchequer. Ferdinand however had an invincible passion for landscape-painting, which the encouragement of the elector palatine, Karl Theodor, enabled him finally to follow, notwithstanding the opposition of his father. He studied eighteen months at Paris, in 1768-70, at the expense of the elector, who appointed him his cabinet painter after his return to Mannheim: he was also made a member of and secretary to the Academy of Mannheim. In 1793 he removed to Munich, where he died in 1799. Kobell was also a very able etcher: a set of his prints, 179 in number, was published in Nürnberg in 1809:—'Oeuvre complet de Ferd. Kobell, peintre de la Cour Electorale Bavarro-Palatine, et graveur à l'eau forte,' &c. In 1822 a 'Catalogue Raisonné' was published by Baron von Stengel, in which 267 prints are described. Nagler has printed a list of them in his Dictionary. Kobell's landscapes are well selected, true in colouring, and executed with care.

FRANZ KOBELL, the younger brother of Ferdinand, was born at Mannheim in 1749. He was intended for a merchant, and spent four years in a merchant's house at Mainz; but his love for the arts, especially landscape and architecture, finally overruled all obstacles, and his brother's patron, the elector Karl Theodor, befriended him also, and enabled him, in 1776, to visit Italy, where he remained an

enthusiastic student of Italian scenery, chiefly at Rome, for nine years. Franz Kobell, though he executed a few pictures in oil, was scarcely a painter, literally, for his works are almost exclusively drawings, chiefly with the pen, and tinted with sepia. He was so industrious in this style of art, that the number of his drawings is said to exceed 10,000, the great bulk of which are in three collections—that of the Duke Albert of Sachsen-Teschen in Vienna, that of H. von Rigal in Paris, and that of Baron Stengel in Munich. He died at Munich in 1822; and a flattering notice of him appeared in the 'Kunstblatt' of the same year, from the pen of his friend Speth, the author of an excellent work on Italian art of the earlier ages—'Die Kunst in Italien,' 3 vols. 8vo, München, 1819-23.

* KOCH, CHARLES PAUL DE, the son of a Dutch banker, gullotined during the reign of Terror, was born at Passy in 1794. Originally intended for his father's business, he spent several years in a banker's counting-house in Paris, where he began to write, "he knew not why." His first attempts were theatrical, consisting of vaudevilles, operas, melodramas, of which he produced a considerable number, before his first novel, 'L'Enfant de ma Femme,' appeared, in 1827. The knowledge of life, manifested in this work, and its humour, caused it at once to become popular. It was followed by 'Jean' in 1829; by 'Frère Jacques,' in 1830; by his chef-d'œuvre, 'Le Cocu,' in 1831; by 'Gustave' and 'Mon Oncle Raymond,' in 1832; by 'Georgette,' 'André le Savoyard,' and 'Le Barbier de Paris,' in 1833. In the year 1834 he produced 'Sœur Anne' and 'Un Bon Enfant.' Although the earliest of his fictions, the foregoing are usually considered his best. In them the novelist has painted the Parisian manners of his time, above all those of the petite bourgeoisie, the shopkeeper, the student, and the grisette with remarkable felicity, but at the same time with equal licence.

In 1836 he published 'M. Dupont'; in 1837, 'Mœurs Parisiennes'; in 1842, 'La Femme, le Mari, et l'Amant'; in 1844, 'La Famille Gogo.' He has since produced many others of less note. Owing to his great fertility of invention, De Koch has sometimes been compared to Alexandre Dumas, whom he does not resemble in most other things. His style is very negligent, especially in his recent novels. But, although it must be regretted, that a writer of so much true humour and genial mirth, too often passes over the limits of sobriety, Paul de Koch by no means belongs to that class of novelists, whose writings, if they do not directly inculcate immorality, at least depict very loose specimens of morality as models for imitation.

KOCH, JOSEPH ANTON, a celebrated German landscape-painter, was born of poor parents at Obergieblin am Bach, in the valley of the Lech, in the south of Germany, in 1768. Some of his early attempts attracted the notice of Bishop Umgelder, vicar-general of Augsburg, who placed Koch with a painter in that city and provided for his maintenance. He was shortly afterwards sent by the bishop to the Carls-Academie at Stuttgart, where he remained seven years, and became in the meantime an able landscape-painter. Koch tried his fortune in Rome at an early date, and he met with complete success; he married a Roman girl and settled himself fixedly in Rome, where he enjoyed a great reputation for, with the exception of a short interval, at least half a century, and he was for many years looked upon as the Nestor of the German artists there. He died at Rome, January 12, 1839.

Koch was not exclusively a landscape-painter, though he is chiefly distinguished as such. He is known for some clever illustrations to Dante. Among his pictures not exclusively landscapes are, 'Noah's Sacrifice,' the 'Emancipation of the Tyrol by Hofer,' the 'Flight of Laban,' the fresco illustrations to Dante in the Villa Massimi, besides some others. He has painted several fine Alpine views; and many poetical landscapes, which are rather characteristic pictures of a peculiar class of scenery than prospects of particular localities. He frequently composed his landscapes out of such peculiarities of mountain scenery as were congenial with his individual taste, and the parts were always well arranged, and true and characteristic in their details. In colouring he was heavy and monotonous. His latest works were comparatively careless in execution. Koch was also an etcher of considerable skill, and among his works in this class are twenty-four designs from the ancient fable of the Argonautic expedition, after Carstens.

KÖLCSEY, FERENCZ or FRANCIS, an Hungarian poet, critic, and orator of the first eminence, was born at Szö-Demetér, in the county of Middle Szolnok in Transylvania, on the 8th of August 1790. He was sent when five years old to the Calvinistic school at Debreczin, where he acquired an excellent knowledge of Greek and Latin, and made a translation of the first book of the 'Iliad' into Hungarian hexameters. Debreczin was the main seat of the opponents to the reform which Kazinczy [KAZINCOZY] was effecting in the Hungarian language, but so warm was the young student's admiration of the reformer that when in his fifteenth year he wrote him a letter as a disciple, which Kazinczy answered with high gratification at finding that something good would come out of Debreczin. A few years later Kölcsey attracted attention by some poems in the 'Transylvanian Museum,' and for some years study and poetry formed his principal occupation. In 1809, having adopted the profession of the law, he became a 'notary to the Royal Table' at Pesth, and was soon known to the literary celebrities of the capital as one of the most distin-

guished friends and followers of Kazincy: but he was never a lover of society, and there was a peculiar gloom and melancholy about him as a young man. A satirical poem and some sharp critiques which he inserted in 1817 in the 'Tudományos Gyűjtemény' drew on him some odium, and for a time he withdrew from periodical writing; but at the persuasion of his friend Szemere he united with him in 1826 in the publication of a periodical of their own, under the title of 'Élet és Literatura' ('Life and Literature'). His critical essays in this publication are considered the best of the kind that Hungary has yet produced.

His reputation stood high, but was purely literary till 1829, when he began to attract attention by the share he took in county business at Szatmar, where he held the office of upper notary, and in 1832 he was sent to the Hungarian diet as deputy of the county of Szatmar. In a short time his political reputation surpassed his literary, and he was for the remainder of his life the acknowledged first orator of Hungary, Kossuth not having then developed his extraordinary talents. His success as an orator was the more remarkable that his personal advantages were small, and he had in his youth lost the sight of one eye. The line he took was that of extreme liberalism, supported with conscientious sternness. When his constituents sent him instructions of an illiberal character with regard to the question of the redemption of the oppressive land tax, he threw up his commission, but was afterwards persuaded to resume it. He was the most intimate friend of Baron Nicholas Wesselényi, the leader of the opposition, and when in 1838 Wesselényi and Kossuth were thrown into prison by the court, he conducted Wesselényi's defence, which was a brilliant specimen of his talents, though it failed of success. On the 24th of August 1838, only eight days after he had finished the defence, he suddenly died, and it is said in the 'Ujabbkori Isemeretek Tara,' of fifteen years later, that Hungary had not yet ceased to mourn him.

A collection of his works, 'Kölcsey Minden Munkái,' was published after his death in five volumes by Eötvös, Szalay, and Szemere, and an account of his life has appeared by his friend Kallay. His diary of the diet of 1832-36, was published at Pesth during the year of revolution 1848, and is a valuable document for Hungarian history. Of his works the first volume contains his poems, the second his tales, the third his critical, the fourth his philosophical, and the fifth his miscellaneous writings. He is a pleasing poet, and a very pleasing and spirited prose-writer; his tales, which originally appeared in some of the Hungarian annuals, being excellent specimens of a lucid and animated style.

KOLLAR, JAN, a poet and preacher, the originator of the idea of Pan Slavism, was born on the 29th of July 1793, according to Jungmann's 'History of Bohemian Literature,' at Moschowitz, in the county of Trentschin in Hungary, being by birth a Slovak, or one of the Slavonic race of northern Hungary, who speak a language akin to that of their neighbours the Bohemians. After studying at Presburg and Jena, he became in 1819 pastor of a Slovakian evangelical congregation at Pesth. In 1823 and 1827 he issued in two volumes, under the title of 'Narodnie Zpiewanky,' or 'National Songs,' an interesting collection of the popular poetry of the Slovaks, which reached a second edition, with additions, in 1834 and 1835. Unlike some other Slovakian authors however, he was far from exhibiting a narrow and exclusive attachment to his native dialect. Considering the Slovakian as too circumscribed in its range to be equal to the dignity of literary composition, he took for the language of his writings the Bohemian, though it was at the time rejected for German in Bohemia itself by several of the native authors. In 1821 he published at Prague a volume of Bohemian sonnets, under the title of 'Basne' ('Poems'); and in 1824 at Buda a new edition, under the title of 'Slawy Dcera' ('The Daughter of Glory'). The copy of the second edition, in the British Museum, formerly belonged to Bowring, to whom it was presented by Safarik, and who has written in it, "This is a very remarkable book, and how its true and fiery spirit should have burst this Austrian censorship is altogether unintelligible to J. B." The leading idea of the poems is that of the common bond of union between all the Slavonic nations, and the work was in consequence not looked upon with favour by the Hungarians, who were anxious to see their Magyar language extended over the whole of Hungary, and observed with apprehension that the Slavonians to the north of the kingdom, and the Slavonians to the south, were beginning to become conscious of their relationship. Kollar proceeded more and more to develop his idea in his 'Slawa Bohynie' ('The Goddess Slava or Glory'), a collection of philological and mythological essays, and in a work in German, on the connection between the Slavonic races and dialects, 'Ueber die literarische Wechselseitigkeit zwischen den Stämmen und Mundarten der slawischen Nation' (Pesth, 1831). In this publication the wish for a general combination of the Slavonic races is more openly expressed than in any previous one. The same idea pervades the 'Cestopia' (Pesth, 1843), a record of a journey to Upper Italy, the Tyrol, and Bavaria, made by Kollar in 1841, chiefly for the purpose of discovering traces of Slavonic antiquity.

Among his other productions is a volume of sermons, 'Kazne' (Pesth, 1831), which were found so eloquent that they were translated into several languages. Kollar was obliged to leave Pesth by the revolution of 1848, and must in the same year have seen many of his

hopes destroyed by the breaking up of the Slavonic Congress at Prague by the cannon of Windischgrätz. In the next year he was, probably by way of compensation, named professor of archaeology at the University of Vienna. In 1851 he made a journey to Mecklenburg, to study the remains of the Obotrites, and on his return to Vienna was surprised by death on the 29th of January 1852, when he was preparing for the press a German work, 'Das slawische Altitalien,' intended to prove that the ancient inhabitants of Italy spoke a Slavonic language.

The work of Kollar which is chiefly admired by his admirers is his 'Slawy Dcera,' which in its latest shape, as it appears in his 'Dila Básnická' ('Poetical Works') published at Buda in 1845, is called a "lyric-epic poem," in five cantos, and extends to 622 sonnets, having little connection except the common idea of 'Panslavism' which pervades them. Whatever the merit of some of the earlier portions, there can be no doubt that some of the later additions are scarcely calculated to awaken respect for the writer, in particular some coarse attacks on Mr. Paget and Miss Pardoe, apparently dictated by a feeling of resentment at their having spoken well of the Hungarians. The prose works of Kollar contain some valuable information, which is however disfigured by an occasional outbreak of the same spirit of mere Slavonic nationality. Several of Kollar's sonnets are translated in Sir John Bowring's work on the Bohemian poets.

* KÖLLIKER, ALBERT, a distinguished living physiologist, more especially known for his researches with the microscope. He was born in Germany, and is at present professor of anatomy and physiology in the university of Würzburg. Kölliker is one of the younger physiologists who has commenced his career since the more extended use of the microscope, and he has distinguished himself by the masterly manner in which he has applied this instrument to the unravelling the intricate textures of the human and animal body. One of his earliest papers appeared in Valentine's 'Repertorium' for 1841, on the reproductive organs and fluid of invertebrate animals. In 1842 he published a thesis on the origin of the ovum in insects, and a comparison between the development of this organ in the articulate animals and the *Vertebrata*. In 1844 he published at Zurich a paper on the development of the embryo of the *Cephalopoda*, and in 1846 a paper on the contractile cells of the embryo of *Planaria*. These and other labours on the minute structure of animals prepared him for a greater work on the Microscopic Anatomy, or Histology of the Human Body. The first volume of this work was published in two parts in 1850 and 1852, and consisted of a detailed account of his own and others' investigation of the tissues of the human body. This work was however too extensive for the use of the medical student, and in 1852 he published a complete work entitled 'Handbuch der Gewebelehre des Menschen,' in one volume with 343 woodcuts. This work was translated into the English language by Messrs. Bask and Huxley, and published in two volumes by the Sydenham Society. It contained a large amount of original investigation, and has deservedly placed Professor Kölliker at the head of the modern school of histologists. Since the publication of this work he has published many papers on the minute structure of the lower animals. He has been several times in England, and was present at the meeting of the British Association held in Glasgow in the year 1855.

KORAY, ADEIMANTOS, born at Smyrna in 1748, of a family from Chios, studied first at Smyrna, and afterwards at Montpellier, where he took his degree as Doctor of Medicine, and settled in France. He wrote several works on medicine, and published French translations of the treatise of Hippocrates 'On Air, Water, and Situation,' with copious notes, and of the 'Characters' of Theophrastus. In 1801 he translated into modern Greek Beccaria's treatise 'On Crimes and Punishments,' which he dedicated to the newly-constituted republic of the Ionian Islands. He afterwards wrote in French a memoir, 'De l'Etat Actuel de la Civilization en Grèce,' 1803, which, being translated into modern Greek, answered the double purpose of making the people of Western Europe acquainted with the moral and intellectual condition of his countrymen, and of making the Greeks acquainted with it themselves. Koray also undertook to edit a series of ancient Greek writers, under the title of the 'Hellenic Library.' He began with the 'Orations of Isocrates,' 2 vols. 8vo, Paris, 1807, which he accompanied with interesting prolegomena and explanatory notes. He afterwards edited in succession the 'Lives of Plutarch,' the 'Histories of Ælian,' the fragments of Heraclides and of Nicolaus Damascenus, the fables of Æsop, Strabo, the first four books of the 'Iliad,' and the 'Politics' of Aristotle. The reputation of Koray attracted many young Greeks to him, who profited by his conversation and instruction. Although long absent from his native country, he felt to the last the most lively interest in her fate. He foresaw that a struggle was approaching, and he wished the minds of the Greeks to be prepared for it. He encouraged particularly the diffusion of education, the formation of new schools in Greece, and he furnished directions for the method and course of studies. He also contributed to fix the rules and orthography of the modern Greek, in which he took a middle path between the system of Neophytus Doukas, which Koray stigmatised with the name of 'macaronic,' and that of Christophoulos, which affected to write the modern Greek exactly as it is spoken. Koray wished to purify the language by discarding the numerous Italianisms, Gallicisms, and Germanisms which had been introduced

into it, and by substituting old Greek words, at the same time avoiding the affectation of too great a purism or classic pedantry. Körner died at Paris in 1833, having had the satisfaction of seeing the struggle in which his countrymen had engaged rewarded by success.

KÖRNER, KARL THEODOR, was born at Dresden in the year 1791, of respectable parents. The weakness of his health prevented any great application to study, and as a child he was rather remarked for the amiability of his disposition than for any intellectual acquirements. However, as he grew, both his mind and body gained strength, and he showed an early inclination to history, mathematics, and physical science. Above all he loved poetry, and was encouraged in his juvenile compositions by his father, who was an ardent admirer of the works of Göthe and Schiller. Being educated at a school in Dresden, and by private teachers, he did not leave his father's house till he was near seventeen, when, being designed to fill some office in the mines, he was sent to the Bergacademie (school mines) at Freiberg, where he made great progress. After completing the necessary course of study, he went to the university at Leipzig, and afterwards to Berlin. A fit of illness however, and the dislike which his father had to the wild spirit then reigning among German students, were the cause of his being sent to Vienna, where he laboured much at poetical composition. Two pieces, 'Die Braut' ('The Bride'), and 'Der grüne Domino' ('The Green Domino'), were acted at the theatre in 1812, and meeting with success were followed by others, of which 'Zriny' and 'Rosamunde' (the English Fair Rosamond), two tragedies, were works aiming at a high character.

The events of the year 1813 made a deep impression on Körner. Inspired by patriotic zeal, he resolved to engage in the cause of Prussia against the French, and joined the volunteer corps under Major Lützow. He was wounded by two sabre cuts at the battle of Kitzén, and lay concealed and disabled in a wood, whither his horse had carried him, until he was removed by two peasants, sent by his comrades, to a place of safety. In a subsequent battle, fought on the 26th of August, on the road from Gadebusch to Schwerin, he was killed by a shot, and buried by his comrades at the foot of an oak on the road from Lübelow to Dreikrug, with all marks of honour, and his name was cut on the bark of the tree.

As Körner was scarcely twenty-two years of age at the time of his death, his works, which are rather numerous, must be judged with lenity. To comprehend the great impression which his patriotic poems made, it is necessary for the reader to throw himself back to the time, and enter into the deep-rooted hatred felt by the Prussians for the French. His fame chiefly rests on a collection of lyrical pieces called 'Leier und Schwert' ('Lyre and Sword'), many of which were written in the camp, and which can now only be properly felt and appreciated when studied in connection with the events that occasioned their composition, and with a full understanding of the sincerity of the poet's character. In fact, this very stamp of sincerity is the chief beauty of his works: they contain no new thoughts or striking creations of imagination, but are pervaded by only one sentiment, the glory of fighting and dying for "fatherland," expressed in a variety of shapes. Körner evidently had a perception of the higher poetical beauties; but his best poems are those which seem the mere unpolished effusions of the moment, and exhibit the feeling quite unadorned. Such is his spirited song 'Männer und Buben' ('Men and Cowards'). The happiest effort of imagination is his 'Schwert-lied' ('Sword-song'), in which the sword becomes a person and addresses its owner; a piece which has been translated (not very closely) by Lord F. L. Gower. English translations of other of his poems and ballads have been published; also 'The Life of Karl Theodor Körner, written by his Father, with selections from his Poems, Tales, and Dramas, translated from the German by G. F. Richardson,' 2 vols, 8vo.

KÖRÖSI, CSOMA SÁNDOR. [CSOMA.]

KOSCIUSKO, THADDEUS, was born in 1756, of a noble but not wealthy family of Lithuania. After studying first at Warsaw, and afterwards at Paris, for the military profession, he was made a captain in the Polish army. He afterwards returned to Paris, and volunteered to accompany La Fayette and others, who were going to assist the revolted American colonies against England. In America he distinguished himself by his bravery, obtained the rank of general officer in the American army with a pension, and after the end of the war returned to his native country. In 1789 he was made major-general in the Polish army. He served with distinction in the campaign of 1792 against the Russians, but King Stanislaus having soon after submitted to the will of the Empress Catharine, and Poland being occupied by Russian troops, Kosciusko, with several other officers, left the service and withdrew to Germany. When the revolution broke out in Poland at the beginning of 1794, Kosciusko was put at the head of the national forces, which were hastily assembled, and in great measure were destitute of arms and artillery. In April 1794 he defeated a numerically superior Russian force at Raclawic. Again in the month of June he attacked the united Russians and Prussians near Warsaw, but was defeated, and obliged to retire into his entrenched camp before the capital. He then defended that city for two months against the combined forces of Russia and Prussia, and obliged them to raise the siege. Fresh Russian armies however having advanced from the interior under Suwarow and Fersen, Kosciusko marched

against them with 21,000 men. The Russians were nearly three times the number, and on the 10th of October the battle of Macziewice took place about 50 miles from Warsaw. After a desperate struggle the Poles were routed, and Kosciusko, being wounded, was taken prisoner, exclaiming that there was an end of Poland. The storming of Praga by Suwarow and the capitulation of Warsaw soon followed. Kosciusko was taken to St. Petersburg as a state prisoner, but being afterwards released by the Emperor Paul he repaired to America, and afterwards returned to France about 1798. Napoleon I. repeatedly endeavoured to engage Kosciusko to enter his service, as Dombrowski and other Polish officers had done, and to use the influence of his name among his countrymen to excite them against Russia; but Kosciusko saw through the selfish ambition of the conqueror, and declined appearing again on the political stage. A proclamation to his countrymen which the French 'Moniteur' ascribed to him in 1806 was a fabrication. He continued to live in retirement in France until 1814, when he wrote to the Emperor Alexander recommending to him the fate of his country. In 1815, after the establishment of the new kingdom of Poland, Kosciusko wrote again to the emperor thanking him for what he had done for the Poles, but entreating him to extend the benefit of nationality to the Lithuanians also, and offering for this boon to devote the remainder of his life to his service. Soon after he wrote to Prince Czartoriski, testifying likewise his gratitude for the revival of the Polish name, and his disappointment at the crippled extent of the new kingdom, which however he attributed "not to the intention of the emperor, but to the policy of his cabinet, and concluded by saying that as he could not be of any further use to his country, he was going to end his days in Switzerland." (Oginski, 'Mémoires sur la Pologne et les Polonais,' Paris, 1827.)

In 1816 Kosciusko settled at Soleure, in Switzerland, where he applied himself to agricultural pursuits. He died in October 1817, in consequence of a fall from his horse. His remains were removed to Cracow by order of Alexander, and placed in the vaults of the kings of Poland, and a monument was raised to his memory.

KOSLOW. [KOZLOV.]

* KOSSUTH, LAJOS (LOUIS), was born April 27th 1802 at Monok, in the county of Zemplin, in northern Hungary. He is the only son of Andreas Kossuth, who belonged to the class of nobles, and was a small proprietor of land. Louis Kossuth was educated at the Protestant college of Sarospatak. In 1819 he commenced a course of legal study, and attended the district court of Eperies and the royal court at Pesth. Having completed his legal education, and received his diploma, he returned in 1822 to Monok, where he was appointed honorary attorney to the county, and obtained a good practice as an advocate. In 1831 he removed to Pesth, and in 1832, as the representative of a magnate, attended the sittings of the Hungarian diet, or parliament, and had the right to speak, but not to vote. He wrote reports of the proceedings of the diet, which were circulated in manuscript, and eagerly read. In order to extend the circulation of the reports he set up a lithographic press. The Austrian government objected to the publication of the reports, and Kossuth was ordered to discontinue his lithographic printing. He continued however to circulate his manuscripts. The session of the diet closed in 1836. Soon afterwards some young men were accused of a political conspiracy, and thrown into prison. Kossuth charged the prosecutors with illegality and injustice; and for this interference he was himself arrested, tried, found guilty, and imprisoned at Buda in 1837. He was kept in solitary confinement three years, without books or writing materials. The diet met again in 1840, and having proceeded to business, declared the imprisonment of Kossuth to have been unjust, and refused to grant the supplies till he was set at liberty. He was released from prison in May 1840: the supplies required were then granted.

On the 1st of January 1841 appeared the first number of the 'Pesti-Hirlap' ('Pesth Journal'), which was published at first four times a week, but soon became a daily newspaper, and at one period attained a circulation of 10,000. Kossuth was the editor in chief. On the 10th of January 1841 he married Teresa Meszlenyi.

The liberal principles advocated in the 'Pesti-Hirlap,' and the large circulation which it had reached, alarmed the Austrian government, which in 1844 succeeded in removing from office the liberal ministry, and replacing it by one of imperialist principles. In November 1847 Kossuth was elected by the county of Pesth as its representative in the diet, which met again in that month. The liberal opposition, headed by Count Louis Batthyany, was very powerful; and on the 3rd of March 1848 the diet adopted a proposition made by Kossuth to send a deputation to the King of Hungary (Emperor of Austria), for the purpose of requiring the formation of a new ministry essentially Hungarian, as well as certain constitutional reforms. On the 15th of March Kossuth entered Vienna with the deputation. Prince Metternich had fled on the 13th, and Kossuth was received by the excited population with the most enthusiastic demonstrations of applause and sympathy. On the 16th the emperor received the deputation, and on the 17th issued a decree which sanctioned the establishment of a new ministry, of which Count Louis Batthyany became the president and Kossuth the minister of finance. On the 24th of March a law was passed by the diet, and received the assent of the King of Hungary, which restored to the Hungarians certain constitutional rights long withheld from them, abolished the feudal services to which the

peasantry had been subjected, and exonerated the class of nobles from the taxes which had been previously levied upon them.

The benefits of the law of the 24th of March were extended to the Servians and Croats; and though they at first rejoiced, in common with the Hungarians, in consequence of their having been raised to the rank of freemen, they were in a short time persuaded by Austrian agents, one of whom was their own archbishop, that the Hungarians intended to subjugate them, and to destroy their religion and nationality. An insurrectionary movement against Hungary was soon organised, and the first outbreak occurred in June 1848. Arms, ammunition, and stores were secretly furnished by Austria, and Austrian officers in disguise led the Servians to battle. Thousands were slain on both sides, towns and villages were burnt, and the frontier districts laid waste. Most of the Hungarian troops were at this time fighting the battles of Austria in Italy. Kossuth displayed extraordinary activity and energy in rousing the Hungarian people by his speeches, in obtaining money, and raising recruits, so that the Hungarian ministry in a short time organised ten battalions of volunteers, who were called Honveds, or Defenders of Home. These raw troops, with the battalions of the line and the regiments of hussars, were the nucleus of what became afterwards the great Hungarian army.

On the 9th of September 1848, Jellachich, the Ban of Croatia, having collected an army of 30,000 Servians and Croats, crossed the Drave and invaded Hungary. He was opposed and defeated by Guyon and others, and obliged to retreat to the vicinity of Vienna. Meantime a royal decree had appointed Field-Marshal Count Lamberg commander-in-chief of the Hungarian army, and he came to Pesth in order to commence the performance of his duties; but so infuriated were the people that they murdered him, September 28, on the bridge which connects Buda with Pesth. In his pocket was found a decree authorizing the dissolution of the Hungarian parliament. A remonstrance was published called 'The Parliament's Address to the Nation,' which produced great excitement in Hungary. At the end of October the Hungarian army crossed the Austrian frontier, advanced to the vicinity of Vienna, and were defeated. In December Prince Windischgrätz, at the head of an Austrian army, crossed the frontier and invaded Hungary. The Hungarian parliament then retired from Pesth to Debreczin. The war was extended; the Austrians suffered a series of defeats, and on the 14th of April 1849, the Hungarian parliament proclaimed the independence of Hungary and the deposition of the House of Hapsburg from their office of kings of Hungary. This measure, which was carried on the proposal of Kossuth, was perhaps injudicious. It was well received by the army in general, but was censured by Görgei, then commander-in-chief, and afforded him a pretext for afterwards thwarting the measures of Kossuth. It was also disliked by many of the people, who were opposed to a change of their ancient constitution and to the separation of the Kingdom of Hungary from the Empire of Austria.

Kossuth was appointed by the Hungarian parliament Provisional Governor of Hungary, and a Provisional Committee was formed to manage the affairs of the nation, which was afterwards organised as a Committee of Defence, of which Kossuth was appointed President. This Committee supplied the place of a ministry till the 1st of May, when a cabinet was formed with Count Szemere as premier. A Russian army soon afterwards crossed the Carpathian Mountains for the purpose of assisting the Austrians, and gradually pursued Görgei's army to the vicinity of Arad, whither the Hungarian ministry had retired from Debreczin. Meantime the Hungarian army of the south was pursued by the Austrian army under Haynau, and was defeated at Temeswar, August 9, 1849. The news of this disastrous event having been communicated to Kossuth at Arad, on the 11th of August he resigned his office of Provisional Governor of Hungary, conferred on Görgei the entire civil and military power of a dictator, and with the officers and part of the army of the south made his escape into the Turkish territories. Görgei on the 14th of August surrendered his army unconditionally to the Russians, and the war then terminated.

Kossuth, and the officers who accompanied him, were detained as prisoners first at Widdin, and next at Schumla. Kossuth was finally placed in confinement at Kutayia, in Asia Minor, where in February 1850 he was joined by his wife, with his two sons and daughter. While at Kutayia he made himself master of the English language chiefly by reading Shakspeare with the aid of Johnson's 'Dictionary.' By the intervention of the English and American governments, through their ambassadors at Constantinople, and in defiance of the threats of Austria, he was set at liberty in August 1851. He left Kutayia September 1, embarked at Smyrna in an American vessel September 13, and landed at Southampton in England October 17. He was received in London and other large cities and towns with boundless enthusiasm. His speeches were listened to with intense admiration, and his command of the English language excited a feeling of wonder. In November 1851 he went to the United States of America, apparently for the purpose of getting up a kind of crusade in favour of Hungary. He excited as much interest and enthusiasm there as he had done in this country; he also collected some money, and landed again in England in June 1852. He has since continued to reside in London, and he spoke occasionally on the subject of the late war with Russia.

Kossuth's Speeches have been published separately and collected, in various forms, among which may be mentioned 'Select Speeches of Kossuth, condensed and abridged, with Kossuth's express Sanction, by Francis W. Newman,' 8vo, 1853; 'Authentic Report of Kossuth's Speeches on the War in the East, at Sheffield and Nottingham, published by himself,' 8vo, 1854.

KOSTER, LAWRENCE, or LAURENT JANSZON, a native of Haarlem in Holland, whom the Dutch consider as the true inventor of the art of printing. He is believed to have been born at Haarlem about 1370; and in after-life filled successively several minor offices in his native town, as sacristan, churchwarden, and treasurer of the church of St. Bavon. His name appears in the registers of that church in the years 1423, 1426, 1432, and 1433. The time of his death is not mentioned. The following is the account given by Hadrian Junius, a Dutch writer of the 16th century, of Koster's claim to the discovery of printing. Junius's 'Batavia' was published in 1588, but the passage, the substance of which we here give, is believed from the context to have been written twenty years before. He relates, that about 128 years before he wrote, this Lawrence Koster resided in a large house, situated opposite the royal palace at Haarlem, which was still standing. That Koster, during his afternoon walks in the vicinity of the city, began by amusing himself with cutting letters out of the bark of the beech-tree; and with these one after another, the letters being inverted, he printed small sentences for the instruction of his grandchildren. That being a man of genius and research, and finding the ink then commonly used apt to spread, he afterwards discovered, with the assistance of his son-in-law, Thomas the son of Peter (who, he tells us, left four children, most of whom afterwards enjoyed high offices in the state), a more glutinous kind of ink, with which he succeeded in printing entire pages, with cuts and characters. That he, Junius, had seen specimens of this kind, printed on one side of the paper only, in a book entitled 'Speculum Nostræ Salutis,' written by an anonymous writer in the Dutch language; the blank pages being pasted together, that the leaves might turn over, like those of an ordinary book, without showing the vacancies. That, afterwards, Koster made his letters of lead instead of wood; and lastly of pewter, finding that metal harder, and consequently more proper for the purpose; and that various drinking cups made of the remains of this old type, were still preserved in the aforesaid house, where, but a few years before, Koster's great-nephew, or great-grandson, Gerard Thomas, had died at an advanced age. That the invention in question soon meeting with encouragement, it became necessary to augment the number of hands employed; which circumstance proved the first cause of disaster to the new establishment; for that one of the workmen, named John (whom Junius suspects might be Fust, for he does not absolutely accuse him), as soon as he had made himself sufficient master of the art of casting the type, and joining the characters (notwithstanding he had given an oath of secrecy), took the earliest opportunity of robbing his master of the implements of his art; choosing, for the completion of his purpose, the night preceding the Feast of the Nativity, when the whole family, with the rest of the inhabitants of the city, were at church, hearing the midnight mass. That he escaped with his booty to Amsterdam, thence to Cologne, and lastly, that he took up his residence at Mainz, where he established his printing-press; from which within the following year, 1442, were issued two books, printed with the characters which had been before used by Lawrence Koster at Haarlem: the one entitled 'Alexandri Galli Doctrinale,' the other 'Petri Hispani Tractatus.'

This account, Junius assures us, he had from several old gentlemen, who had filled the most honourable offices of the city, and who themselves had received it from others of equal respectability and credit, as a well-founded tradition; as a lighted torch, he says, passes from one hand to another without being extinguished. He adds, that he well remembers Nicolas Galius, the tutor of his youth, who was an old gentleman of very tenacious memory, used to relate that when he was a boy he had often heard one Cornelius, then an old man, upwards of eighty years of age, who had been a bookbinder, and in his youth had assisted in the printing-office of Koster, describe with great earnestness the various trials and experiments made by his master in the infancy of the invention: upon which occasions he would even shed tears, especially when he came to the robbery committed by one of the workmen, which he related with great vehemence; cursing those nights in which, as he said, for some months he had slept in the same bed with so vile a miscreant, and protesting that he would with his own hands have hanged the thief if he had been still alive: which relation, as Junius tells us, corresponded with the account which Quirinus Talesius, the burgomaster, confessed to him he had heard from the mouth of the same old bookbinder.

The foregoing is the only evidence in favour of Koster's claims. Conjectures and explanations have been given in abundance, but no further confirmation. No production of Koster's has been satisfactorily discovered, for the 'Horarium,' found by Enschedijs, a letter-founder and printer at Haarlem, of which he published a fac-simile in 1768, was, there can be little doubt, a forgery. It is true that the civic records of Haarlem prove that a Lawrence Janszoon lived there at the period mentioned, indeed there were three of the name between 1420 and 1440, one of whom was Koster, a sexton of St. Bavon's, and

another is distinguished as a rioter, but no entry in proof of any connection with printing. Let us therefore examine the credibility of the narrative as given by Junius. The first thing that must strike any one acquainted with printing is the unfitness of beech-bark as a material for wooden types. Scriverius, who wrote in 1628, feeling this varies the story: he says it was "a small bough of a beech or rather of an oak-tree." It however does not matter much, as Junius goes on to say that he afterwards made his types of lead or pewter. Here then was the invention complete. He is afterwards robbed of the implements of his trade by one of his workmen, who escapes to Amsterdam, and thence to Cologne, and lastly to Mainz, where he establishes his press. What did this workman steal? the materials of a printing-office, the presses and types, even in that early stage of printing, must have been bulky and weighty, could not have been moved with any great facility, and could have been easily traced and followed. If he only stole the matrices, with the knowledge which he had acquired, that was no reason for Koster's abandoning an art which Junius says was prospering. The name of the workman was John, and Junius implies that he at least has no doubt it was Fust; he only refrains from discussing the matter because he does "not wish to disturb the dead already enduring the pangs of conscience for what they had done when living." As however it became clear that Fust could not have been the man, the supporters of Koster's claims concluded that it must have been Gutenberg; and when again it was proved by undeniable documents that Gutenberg could not have been in Haarlem at the time, they invented a brother for Gutenberg, also of the name of John. Junius was told the story by Nicholas Galius, who had it from Cornelius, the old bookbinder. Cornelius it is ascertained died in 1522, at least ninety years old. In 1440, which would be the date 128 years before the time of Junius's writing, he would therefore be perhaps a little more than eight years old, yet he was at that age an assistant in the printing office, and slept with the criminal. It is also ascertained that Koster the sexton died about 1440, and as the journeyman thief had been some time acquiring his knowledge, it must have been about 1441 that the robbery took place, yet Cornelius says nothing of his master's death. Meerman, who supports Koster's claim, to obviate this objection, makes the business to have been carried on by Koster's grandchildren, but of this there is no record, nor are any of their productions extant. Finally, Junius, who was a learned man, had been dead twelve years when his book was published. It is not improbable that the whole passage may be an interpolation made by some one desirous to advance the reputation of Haarlem.

It is needless to mention the names of the writers who have supported the claims of Haarlem. Otley and T. F. Dibdin were the last in England, and indeed they are now given up generally. J. Wetter, in his 'Kritische Geschichte der Erfindung des Buchdruckerkunst,' published at Mainz, in 1836, boasts that he has completely disposed of all its pretensions; and he is equally positive against all the claims advanced by other places, such as Cologne, and even with regard to Strasbourg, after using Schöpfung's discoveries as to the progress Gutenberg had made at Strasbourg [GUTENBERG], he turns round in an appendix, and endeavours to prove that Schöpfung, in order to exalt his own city, had interpolated the passages in the legal process in which the technical terms relating to the printing art were used; that Drytzen was a manufacturer of metal mirrors, the forms being moulds into which the metal was poured; and that the moveable pieces (stücke) were wooden ornaments for the frames. He also asserts that Gutenberg's first books were produced from solid wooden blocks; that then the letters were sawn asunder and thus used, the letters being threaded together in lines; and that he subsequently discovered the method of casting types.

KOTZEBUE, AUGUST FRIEDRICH FERDINAND VON, was born at Weimar in the year 1761. In his sixth year he made attempts at poetical composition, and his interest for theatrical matters was excited by the performances of a company of players at Weimar. At the gymnasium he was instructed by Musäus, the celebrated author of the 'Volksmärchen' ('Popular Tales'); and when he was sixteen years of age he went to the University of Jena, where an amateur theatre increased his love for the drama. He studied the law, but at the same time composed slight theatrical pieces. In 1781, at the instance of the Prussian ambassador at the Russian court, he went to Petersburg, and was kindly received by the emperor, who raised him to the rank of nobility, and made him president of the government of Esthonia. While at Reval he wrote several favourite works, and among them his well-known pieces 'Die Indianer in England' ('The Indians in England'), which has been translated into English, and 'Menschenhass und Reue' ('Misanthropy and Repentance'), well known in this country under the title of 'The Stranger.' He travelled in 1790 to Pyrmont, and after the death of his wife visited Paris, but returned to Esthonia in 1795, where he wrote above twenty dramas. In 1798 he went to Vienna as poet to the Court Theatre, but gave up that place in two years, and received a yearly pension of 1000 crowns. He had scarcely arrived in Russia, to which country he had returned, when, without knowing the cause, he was arrested and sent to Siberia. A translation made by a young Russian of a paltry little piece by Kotzebue, called 'Der Leibkutscher Peters des Grossen' ('The Body-Coachman of Peter the Great'), so delighted the Emperor Paul that he was recalled from banishment.

After the death of this emperor, Kotzebue went to Weimar, and thence to Jena. Some disagreement with Göthe caused him to remove to Berlin, where he edited the periodical 'Der Freimüthige' ('The Free-Humoured'). About the same time he commenced his 'Almanach dramatischer Spiele,' an annual much in the style of those in England, though the plates are of an humbler character, and the literary part is exclusively dramatic. His 'Recollections' of Paris, of Rome, and of Naples, and his 'Early History of Prussia,' appear to have added little to his reputation. The events of the year 1806 caused him to fly from Prussia to Russia, where in his writings he unceasingly attacked the Emperor Napoleon and the French. His political expressions at this time raised him to importance, and the turn of affairs in 1813, and the unpopularity of the French, procured him the editorship of a Russian-Prussian paper. In 1814 he went as Russian consul-general to Königsberg, where he wrote several little plays, and an indifferent history of Germany. In 1817, after having again visited Petersburg, he was despatched to Germany by the emperor of Russia, with a large salary, to watch the state of literature and public opinion, and to communicate all that he could learn. He at the same time edited a weekly literary paper, but the German people had at last become disgusted with his scoffing at everything like liberal opinions. Against these and against the freedom of the press his writings were constantly levelled. He sneered at every expression of the popular wish for a constitutional government. He held up the state of Europe before the French Revolution as the perfection of happiness; till at last he roused the indignation of Sand, a student and political enthusiast, who, considering him an enemy to liberty, assassinated him in 1819.

Kotzebue's name rests almost entirely on his dramas, which are nearly one hundred in number, and of the most various degrees of merit. The best of them (excepting 'The Two Klingsbergs') have been translated into English. Besides 'The Stranger' and 'The Indians in England,' it is only necessary to enumerate 'Lovers' Vows' ('Der Strassenräuber aus Kindersliebe'), 'Pizarro' ('Die Spanier in Peru'), 'The Virgin of the Sun,' and 'Benyowski.' Unfortunately for a permanent reputation, he created too great a sensation at the time of his writing; the public were at first delighted, and afterwards surfeited by his exaggerated expressions, his forced situations, and maudlin sentimentality. A reaction accordingly has taken place, and he is now as much despised as he was formerly overrated, and certainly more than he merits. It is not fair to criticise him in a merely literary point of view: he was an actual working writer for the stage, and his knowledge of dramatic construction and of stage effect must call forth the approbation of every qualified judge. Göthe reckoned as the best of his plays 'Die beiden Klingsberg' ('The Two Klingsbergs'), a genteel comedy of great merit, but little known in this country.

KOTZEBUE, OTTO VON, captain in the Russian marines, was son of the above. In the year 1814 he set out on a voyage round the world, which he completed in 1818, and of which he published an account three years afterwards. He had previously gone round the world as a midshipman under Krusenstern. In 1824 he undertook a third voyage as captain of an imperial man-of-war, when he discovered two islands in the South Sea, and returned in 1826. An account of this voyage was published in London by Kotzebue's companion, Dr. Eschholz, and by himself in St. Petersburg. He died in March 1846.

KOZLOV, IVAN IVANOVICH, a Russian poet, who was much attached to the English language and literature, was born in 1774, moved in the higher circles of society, and was, it is said, remarkable for his liveliness and activity, till in his twenty-ninth year he was by paralysis deprived of the use of his feet. He was previously acquainted with French and Italian, but it was not till after he was thus afflicted that he made himself master of English, which he studied during intervals of pain. A still severer calamity awaited him, for he was afterwards deprived of his sight. A deep feeling for poetry was first developed in him after his afflictions, and during the remainder of his life the study and the composition of poetry formed his chief consolation. He died in 1838. In the collection of his poetical works, which occupies two volumes, the chief are two narrative poems in the style of Byron, 'The Monk' (Chernetz), and the 'Princess Dolgorukaya.' Among his numerous translations from the English are the 'Funeral of Sir John Moore,' Wordsworth's 'We are Seven,' Byron's 'Bride of Abydos,' Scott's 'Young Lochinvar,' in which, from some singular fancy, he has altered the name from Lochinvar to Waverley, and extracts from 'Don Juan' and 'Childe Harold.' Among the original poems is an interesting epistle to Walter Scott, expressing the vain longings of the author to visit Abbotsford and gaze on the abbey of Melrose. Kozlov was such a writer of English that he even translated Pushkin's 'Fountain of Bakhiserai' into our language, and forwarded it to Lord Byron with a request to be permitted to dedicate it to the English poet. It was about the time of Byron's death, and Kozlov never received an answer. He afterwards intrusted it to an English traveller in Russia (we believe Captain Chamier), who in his 'Anecdotes of Russia,' published in the 'New Monthly Magazine' for 1830, gives a specimen, which is as correct in language as if written by an Englishman, and possesses considerable poetical merit. His verses in Russian are extremely tender and harmonious, and breathe a spirit of melancholy which is not surprising under the circumstances of the

author. Some of the finest are prefixed to a translation of the 'Cotters' Saturday Night.'

KRAFFT, ADAM, a celebrated sculptor and architect of Nürnberg, where he was born about 1435; he married in 1470. There are several of his performances still extant in the city and churches of Nürnberg, but the principal is the remarkable tabernacle in stone, fixed against one of the columns of the choir of the church of St. Lawrence, Lorenzkirche. It is in the form of a square open Gothic spire, and is 64 feet high, the pinnacle being turned downwards like the crook of the crosier or an episcopal staff, to avoid the arch of the church. The ciborium is placed immediately upon a low platform which is supported partly by the kneeling figures of Adam Krafft and his two assistants; the rail or baluster of the platform is richly carved, and is ornamented with the figures of eight saints. The whole tabernacle is also profusely ornamented with small figures in the round and bassi-relievi:—immediately above the ciborium, on three sides, are representations in basso-relievo of 'Christ taking leave of his Mother,' the 'Last Supper,' and 'Christ on the Mount of Olives;' high above these are—'Christ before Caiaphas,' the 'Crowning with Thorns,' and the 'Scourging;' above these is the 'Crucifixion;' and lastly, above that is the 'Resurrection,' all in the round. This elaborate work was executed by Krafft for a citizen of the name of Hans Imhof, and for the small sum of 770 florins; if the ordinary florin, about 70l. sterling. There is a print of this tabernacle in Doppelmayr's work on the artists of Nürnberg. Recent writers have indulged in various conjectures regarding the time and works of Krafft, but the circumstances of both are still involved in their former uncertainty. He is supposed to have died in the hospital of Schwabach in 1507. Sandrart has inserted the portrait of Krafft in his 'Academy,' from the figure mentioned above, under the tabernacle.

(Sandrart, *Teutsche Academie*, &c.; Doppelmayr, *Historische Nachricht von den Nürnbergischen Künstlern*, &c.; Füseli, *Allgemeines Künstler-Lexikon*; Nagler, *Allgemeines Künstler-Lexikon*.)

KRANTZ, ALBERT, was born at Hamburg about the middle of the 15th century. He studied at Rostock, where he took degrees, and was made professor of philosophy and rector of that university in 1482. He afterwards became a canon of the cathedral of Hamburg, was elected syndic in 1489, and was sent by the Confederation of the Hanseatic Towns on several missions to France and England. He died at Hamburg in 1517. He is the author of several historical works:—1, 'Chronica Regnorum Aquilonarum, Danie, Suecie, et Norvegie,' printed in 1546; 2, 'Saxonia, sive de Saxonie gentis vetusta origine,' libri xii., 1520, with a Preface by Cisterius; 3, 'Wandalia, sive Historia de Wandalorum vera origine, variis gentibus, crebra e patria migratione, regnis item quorum vel autores fuerunt vel eversores,' libri xiv., 1519; 4, 'Historia Ecclesiastica Saxonie,' 1548. All these works have gone through several editions.

KRASICKI, IGNACY, a Polish poet of the first degree of eminence, was born at Dubiecko, on the 3rd of February 1734, received his first education at Lemberg, entered the priesthood, and afterwards spent some years in Rome. On his return to Poland, he attracted attention to his literary talents by his contributions to the 'Monitor,' a series of essays in imitation of the English 'Spectator,' published at Warsaw. He was taken notice of by the king, Stanislaus Poniatowski, with whom he became a special favourite, and to whom some of his first poems, which contain delicate flattery in the guise of satire, are addressed. By the king's favour he first became coadjutor to Grabowski, bishop of Warmia, or, as the Germans name it, Ermeland; and in 1766, on Grabowski's death, succeeded to the see. At the diet of 1768 he made use of his dignified position to endeavour to avert the fast approaching ruin of Poland; but in 1772, on the first partition of the country, his diocese became a part of Prussia, and he found himself a subject of Frederick the Great. Krasicki was remarkable for his cheerfulness in society and his flow of easy wit, which soon made him a favourite with Frederick as it had with Stanislaus. When the king told him one day that he hoped he would take him under his robes into Paradise, the bishop replied—in allusion to the loss of some of his revenues—that his majesty had cut his robes too short to allow him any chance of being able to smuggle contraband—a repartee which has found its way into several English jest-books. Frederick once assigned him, when on a visit to Sans-Souci, the apartments which had been occupied by Voltaire, and told him that under such circumstances he must surely be inspired; and the bishop wrote in those apartments his humorous poem of the 'Monachomachia,' or 'War of the Monks.' In 1795 Krasicki was raised to the archbishopric of Gnesen. He died at Berlin, on the 14th of March 1801, and twenty-eight years after, in 1829, his remains were removed to the cathedral of his archbishopric.

Krasicki wrote both in verse and prose, on a great variety of subjects, though nothing, we believe, on theology. As a poet, he is in Polish literature nearly what Pope is in English. "If he had written nothing but his fables and satires only," said Dmochowski at the beginning of this century, "he would still have been at the head of the poets of Poland;" and the only Polish names that are placed above his are of a subsequent period. His Fables, which are in eight books, are of very different kinds: the first four are of a simplicity of style and subject almost adapted to children; in the other four, entitled 'Bajki Nowe' ('New Fables'), he aims, with success, at a rivalry with

Lafontaine and other great masters of the class. His 'Epistles' and 'Satires' are full of polished wit, less cutting than urbane; the epistles addressed to Stanislaus Poniatowski are particularly happy. The 'Myzaseis,' or 'Mousiad,' is a burlesque poem on the old Polish tradition related by Kadlubek of King Popiel, who, like Bishop Hatto of the Rhine, was for his inhumanity devoured by mice and rats. His 'Monachomachia,' already alluded to, and his 'Antimonachomachia,' are two other burlesque poems, of which the former is highly valued. He was less successful in the serious epic: his 'Wojna Chocimska,' or 'War of Chocim,' which celebrates the exploits of Chodkiewicz against the Turks, is not considered a masterpiece. His translation of 'Fingal,' and a few other of Ossian's poems in heroic verse, rather detract from than add to his fame. As a prose writer, his two novels, 'The Adventures of Nicholas Doswiadczynski,' in which he aims at pointing out the faults of systems of education, is much less esteemed than his 'Pan Podstoli,' in which he satirises the faults of his countrymen in the history of a country gentleman. This work was a favourite with its author, who was projecting a continuation of it at the time of his death, and is still we believe a favourite with the Polish public. The remainder of his prose works consist of translations of Plutarch, &c., and a general survey of the poetry of all nations, which is remarkable for the very superficial acquaintance shown by its author with the English and German authors whom he has occasion to mention, and the extreme shallowness of his criticism. A nearly complete edition of Krasicki's works was published at Warsaw in 10 vols. in 1803-4, under the editorship of Dmochowski; a new edition of the whole in one double-columned octavo, which was issued at Paris in 1830, is perhaps the neatest extant specimen of typography in the Polish language.

KRASINSKI, COUNT VALERIAN, was a native of the ancient Polish province of White Russia, and was descended from a noble family. The branch to which he belonged embraced at an early period the Protestant faith, to which he adhered. He received a superior classical education, and while yet a young man was appointed chief of that department of the ministry of public instruction in the kingdom of Poland which was charged with the superintendance of the various classes of dissenters. He was zealous in his endeavours to promote instruction among them, and especially exerted himself in the establishment of a college at Warsaw for the education of Jewish rabbis. In order to lessen the expense of valuable works, especially those on scientific subjects, he was the first to introduce stereotype printing into Poland, and this was not accomplished without a considerable diminution of his own income. When the Polish revolutionists of 1830 had proclaimed the throne of Poland vacant, and organised a national government, with Prince Adam Czartoryski as president, a diplomatic mission was sent to England, of which Count Valerian Krasinski was a member. When the Russian armies in 1831 had overpowered the revolutionary movement of his countrymen, he was still in England, where he then became, with many others of his countrymen, a penniless exile. After having instructed himself in the English language, he attached himself to literature as a means of support, and became the author of several valuable works. He resided in London during the first twenty years of his exile, and during the last five in Edinburgh, where he died December 22nd, 1855. He was a man of varied learning, and possessed extensive information, especially on all matters connected with the Slavonic races. His conversation was instructive and his manner elegant, and he was admitted to the best society.

His most important works are the following:—'The Rise, Progress, and Decline of the Reformation in Poland,' 2 vols. 8vo, 1839-40; 'Panславism and Germanism,' 12mo, London, 1848; 'Lectures on the Religious History of the Slavonic Nations,' 8vo, London, 1849; 'Sketch of the Religious History of the Slavonic Nations,' 8vo, Edinb., 1851; 'Montenegro and the Slavonians in Turkey,' 8vo, Edinb., 1853; 'A Treatise on Relics,' by J. Calvin, newly translated from the French Original, with an Introductory Dissertation on the Miraculous Images of the Roman Catholic and Russo-Greek Churches,' 8vo, 1854. He published also some smaller works and pamphlets on recent political subjects, especially on those connected with the restoration of Poland.

*KRASZEWSKI, JOZEF IGNACY, the most voluminous of Polish authors, and one of the most voluminous in Europe, was born at Warsaw, on the 26th of July 1812, received his earlier education at Wilna, and afterwards improved it during travels abroad and by private study at home. Living on his estate at Omelno in Volhynia, he has devoted himself to literary activity, and with very striking results. In 1853 his novels amounted to upwards of a hundred volumes, and he still shows no signs of exhaustion. In the 'Bibliografia Krajowa,' or monthly list of Polish publications, which was commenced by Klukowski and Rafalski in January 1856, we observe in the first number no less than five novels by Kraszewski, one of which had previously appeared in the 'Gazeta Warszawska,' and the others in the 'Dziennik Warszawski,' so that he appears to keep two newspapers supplied. Of his novels, which are very popular in Poland, the best are said to be 'The Magic Lantern,' and 'Under Italian Skies.' Of his poems, 'Anafielas, a Story of the Traditions of Lithuania,' and 'Satan and Woman,' are the most popular; the former is in three substantial octavo volumes. He has also written numerous volumes of travels, 'Recollections of Odessa,' &c., and a 'History of Wilna,' in 4 vols.,

which is said to be not at all a superficial production, but an excellent and trustworthy local history. Two series of 'Literary Studies' are to be added to the list; and he was also the editor of a popular Wilna magazine, entitled the 'Athenæum'—a title which was simultaneously employed by three periodicals, at Wilna, at Pesh, and at London.

KRUILOV, IVAN ANDREEVICH, the Russian La Fontaine, the undoubted head of Russian fabulists, was born at Moscow on the 2nd of February, Old Style (the 13th New Style) 1768. By a singular coincidence the same day half a century before was the birthday of Sumarokov, also a popular fabulist, but whose fables, says Pletnev, are as different from Kruilov's, as earth from heaven. His father was a poor officer of the army, who was continually on the move, and who chanced to be besieged in a fort along with his family by the rebel Pugachev, in the singular outbreak of the Cossaks in 1772, when he made such a resolute defence that Pugachev swore he would not leave one of the family alive if he got them in his power. Fortunately for Russian literature the defence succeeded, and the child of four years old, who was comprehended in the threat, escaped. The elder Kruilov died in 1780 at Tver, leaving behind him a very respectable miscellaneous library, which the boy, now left alone with his mother, devoured with eagerness. Among the books were several plays, and young Kruilov was smitten with the desire of writing one, and before he was fifteen had produced an opera called the 'Kafeinitza,' or 'Fortune-Teller by Coffee.' When his mother removed to St. Peter-burg to beg him a place as a clerk, he offered his opera to a German bookseller of the name of Breiskopf, who, struck with the youth of the author, offered him sixty rubles for the manuscript, which the boy took out in books, choosing the works of Racine, Molière, and Boileau. He had already while at Tver learned French, by his mother's choice, from a French tutor there, but though he afterwards read it well, he was never in the course of his life able to speak it fluently. At St. Petersburg he became acquainted with the actors, and before he was eighteen wrote another play, a tragedy, called 'Philomela,' which he could not get acted, but which was printed in the collection called 'The Russian Theatre,' which the Princess Dashkov [DASHKOV] was bringing forth under the auspices of the Russian Academy, and in which everything in a dramatic shape was readily inserted, good, bad, or indifferent. For some years Kruilov, who had obtained a place as clerk in one of the public offices, pursued his career as an official and a dramatist, and also occasionally as an essayist and a journalist, and in 1801, having been recommended to the Empress Maria, he was promoted to be secretary to Prince Galitzin, governor of Riga, who took such a fancy to him that he invited him to his country-house at Saratov, where he staid three years apparently in the enjoyment of complete indolence. He wrote four or five plays, among which the 'Modnaya Lavka,' or 'Milliner's Shop,' and the 'Urok Dochkam,' or 'Lesson to Ladies,' were tolerably successful, especially the former. But it was not till he was about forty years of age that he accidentally discovered in what his genius really lay. He translated some fables by La Fontaine, which he showed to Dmitriev the poet, who was eminent for his success in fable writing, and who at once told Kruilov to persevere. He produced some original fables which were soon in every mouth, and from that time he confined himself to this kind of writing, in which he soon attained the most amazing popularity which has not diminished to the present moment. The whole number of fables in verse composed by him during his life amounted to 197, of which 37 only are taken from other authors, and 160 are of his own invention. They are written in so lucid a style that when read aloud they are at once understood and relished by the most illiterate Russian, and yet they are as much the delight of the critic as the fables of his great prototype La Fontaine. Innumerable lines in them have become proverbial, and many happy phrases coined by Kruilov have become part of the language. Several editions have been printed of the most splendid, and several of the cheapest character, and it was said in 1854 that no less than 80,000 copies of them had been put in circulation. When the Imperial Library of St. Petersburg was first opened to the public in 1812, Kruilov was nominated to the post of one of the assistant officers, and the emperor Alexander assigned to him a pension of 1500 assignat rubles (about 60*l.*) above his salary, and eight years after he doubled it. In the year 1834 the emperor Nicholas doubled it again. The new year's present from the emperor Nicholas to the hereditary prince, the present Alexander II., was in 1831 a bust of Kruilov. He was a frequent guest at the table of the empress Maria, and the honoured friend of Karamzin, Zhukovsky, Pushkin, and all the other celebrities of Russian literature. His duties at the library were far from onerous, and he went in fact into an indolence so complete that not even his passion for the drama remained, and he did not enter the inside of a theatre for ten years. On one occasion however he made a singular effort—one of his closest friends was his colleague at the library, Gnedich, the translator of the 'Iliad,' and in a conversation with him one evening at the house of Olenin, the director of the library, Kruilov contested the justice of his opinion that it was impossible to acquire a knowledge of one of the ancient languages late in life, and laid a wager that he would master Greek. The conversation dropped, and the wager, which was looked upon as a joke, was soon forgotten by all of the company, except Kruilov. Two years after he claimed the wager from Gnedich,

and offered to be put through his examination, when it was found that he was a Grecian of no ordinary calibre. For these two years, Kruilov, then a man of fifty, had passed his evenings over this study instead of cards, and such was the result. He afterwards bought and read through a collection of the Greek classics, but as he used to throw the volumes underneath his bed, they were taken to light the fires, and he never interfered to prevent it. His duties as librarian were confined to the Russian books only, which are kept separate from those in all other languages, and in which Sopikov, the author of the 'Russian Bibliography,' was for some time his superior officer. On the 2nd of February 1833, his attaining his seventieth year was celebrated by a grand dinner of the literary men of St. Petersburg, at which 300 authors are said to have been present, and on that occasion the emperor, who had already conferred on him two orders of knighthood, bestowed a third. He retired from his librarianship in 1841, and died on the 11th (or 23rd) of April 1844, of the effects of indigestion. Numerous stories are current of his eccentricities of character, which are told in a very exaggerated form by his French biographer, Bougeault, to that in which they appear in the pages of his Russian biographer Pletnev.

In 1823 Count Gregory Orlov printed at Paris a series of poetical versions from Kruilov in French and Italian, made by some of the first poets of those countries from prose translations with which he had supplied them. The result was a failure, for the liberties taken by the poets destroyed in many cases all resemblance to the original. It may be doubted if an author who is idiomatic can ever be satisfactorily translated, and a foreigner acquainted with Russian is often unable to see half the beauties which strike a native. It cannot be doubted however, from the effect that they have produced, that the fables of Kruilov are only second in excellence of execution to those of La Fontaine, and he has this pre-eminence over his French competitor, that he has displayed a merit to which the other has no claim—namely, that of invention.

KRUMMACHER, FRIEDRICH ADOLF, the elder of a family of distinguished German clergymen, was born at Tecklenburg in Westphalia, on July 13, 1768. He was educated for the church, and after having been professor of theology in the University of Duisburg, he accepted the office of reformed preacher at Crefeld, which he shortly exchanged for the country living of Kettwich in Westphalia. In 1819 he was called to the consistorial council of Bernburg, in 1824 to Bremen, and died in 1845. He was a prolific writer both in prose and verse. His drama of 'Johannes' is not distinguished by much poetic or dramatic feeling, but his hymn of Love and his Parables became very popular, and the last have been translated into English. He also wrote 'Der Hauptmann Cornelius' ('Cornelius the Centurion') and 'Das Leben des heiligen Johannes' ('the Life of St. John'), which have likewise been rendered into English. His other principal works are—'Die Kinderwelt,' a book of religious poetry for children; 'Leiden, Sterben, und Auferstehung unser Herrn Jesu Christ' ('The Sufferings, Death, and Resurrection of Jesus Christ'); 'Ueber den Geist und die Form der evangelischen Geschichte in historischer und ästhetischer Hinsicht' ('On the Spirit and Form of Evangelical History in its historical and æsthetical Relations'); and many other works of similar character.

GOTTFRIED DANIEL KRUMMACHER, his younger brother, was born April 1st, 1774. He studied at Duisburg, became a popular preacher at Baerth and Wolfrath, and in 1816 a reformed minister at Elberfeld. He was at the head of the sect of Pietists in his district, and his sermons on the wandering of the children of Israel through the wilderness to Canaan, were highly esteemed, and have been translated into English. In 1833 he published 'Tägliches Manna' ('Daily Manna'), a work also held in very general repute, and which has appeared in English under the title of 'The Christian's Every-day Book.' He died in 1837.

* FRIEDRICH WILHELM KRUMMACHER, was the son of the first-named, and the nephew of the second. He joined the reformed party, and was for awhile the pastor of a reformed community at New York. As a strong upholder of the older Lutheranism, he excited the displeasure of the adherents of Rationalism, and was accused of heresy from the pulpit of his own father. He has produced numerous works, most of which have been translated, and have been very popular in England. Among them are 'Elijah the Tishbite,' 'Elisha,' 'Relics of Elijah,' 'Solomon and the Shulamite,' 'Temptation of Christ,' 'Sermons on the Canticles,' 'The Church's Voice of Instruction,' 'A Glance into the Kingdom of Grace,' 'Glimpses into the Kingdom of Grace,' &c., &c. He has latterly resided at Berlin, and has received the degree of D.D. In 1856 he visited Great Britain, and was present at the annual conference of the Evangelical Alliance at Glasgow in August. In the course of his speech at one of the meetings he took occasion to repel as "an infamous calumny" the assertions of some of the English journals as to the inebriety of the king of Prussia.

KUGELGEN, GERHARD AND CARL VON, twin brothers and distinguished painters, were born at Bacharach on the Rhine, in 1772. Their father was Hof-kammerrath, exchequer counsellor, in the service of the elector of Cologne, who in 1791 sent the twins to complete their studies in Rome after they had made sufficient progress at home. Gerhard painted history and portrait; and Carl, landscape. Gerhard

was induced to try his fortune at St. Petersburg, whither he was soon followed by his brother Carl: they both met with great success, and married two sisters, of a noble family of Curland; but Gerhard, after a few years, removed in 1804 to Dresden; Carl remained at St. Petersburg, where he was appointed court painter. Gerhard had established himself and obtained a high reputation at Dresden, where he held the appointment of professor of painting at the Academy, when his career was suddenly cut off in a most melancholy manner. He was brutally robbed and murdered on the road from Pillnitz to Dresden, not far from the capital, in 1820. It was a common highway robbery; the miserable wretch who committed the deed was not in the least aware of who his victim was. He was a private soldier, and his singular cupidity was the cause of his detection. He even drew off the boots of Kügelgen, and his afterwards taking these boots to be mended to the very man who had made them and who knew them, is said to have been the cause of his detection. Gerhard Kügelgen's works are of a very unpretending character; in most of them an abstract religious sentiment is the chief and characteristic motive; in execution they are careful, delicate, and somewhat formal, yet pleasing and impressive. He delighted in compositions of one or at most very few figures, often three-quarter lengths of the size of life. His biography, by F. Hasse, was published at Leipzig in 1824.

Carl Kügelgen painted many landscapes, and executed many drawings of the scenery of Russia, both in the northern and southern provinces. He made two journeys in the Crimea for the express purpose of painting its scenery; the first journey was made in 1804 by desire of the emperor Paul, the second by that of the emperor Alexander in 1806. Thirty oil-paintings and sixty sepia drawings, part of the fruits of the second journey, were purchased by the emperor, and placed together in a hall in Kammoi Ostrof. In 1818 Alexander sent Kügelgen for a similar purpose into Finland, of which country he painted fifty-five pictures, which also were purchased by the emperor. Kügelgen executed in all 171 pictures and 290 finished drawings. He died at Reval in 1832. His Life is in the 'Neuer Nekrolog der Deutschen,' x. 1.

* KUGLER, FRANZ THEODOR, Professor of the History of Art in the Royal Academy, Berlin, was born on the 9th of January 1808 at Stettin in Pomerania. On the completion of his collegiate studies Herr Kugler especially devoted his attention to the early history of painting and architecture, for which purpose he made a prolonged stay at Heidelberg, and subsequently visited Italy. Poetry and music also occupied much of his attention, and he in 1830 gave evidence of his attainments in these arts by the publication of his 'Sketch Book,' in which he included original compositions in poetry, music, and linear design; he also in 1833 published with Reinick an artists' song-book. But the more important as well as the most numerous of his writings about this time, were those on the history of art during the middle ages; though the arts of ancient Greece and Rome (and particularly the subject of polychromy, on which he published 'Ueber die Polychromie der Griechischen Architectur und Sculptur und ihre Grenzen,' 4to, Berlin, 1835) also engaged his pen. His great work, the 'Handbuch der Geschichte der Malerei' (Handbook of the History of Painting from the Age of Constantine to the Present Time) appeared in 2 vols. in 1837. It was received with great approbation by his learned countrymen and by students of art generally, and was quickly translated into the leading languages of Europe. In England the translation appeared in parts, the 'Schools of Painting in Italy,' translated by a lady (Lady Eastlake), with Notes by Sir Charles Eastlake, in 1842; and subsequently, the 'German, Flemish, and Dutch Schools of Painting,' and the 'Spanish and French Schools of Painting,' under the editorship of Sir Edmund Head. A second edition of the 'Handbuch' was issued in 1850, in which, with the assistance of Dr. J. Burckhardt, the work was to a great extent remodelled, and a large amount of new materials embodied; and from this revised work a new edition of Sir Charles Eastlake's version of the 'Italian Schools' was published in 2 vols. 8vo, with additional notes and upwards of a hundred outlines from the old masters, by Mr. G. Scharf, thus rendering the English translation of this portion of the work of even more value than the original. Of Dr. Kugler's other works, which are somewhat numerous, may be named his 'Geschichte Friedrichs des Grossen: Gezeichnet von A. Menzel' (8vo, Leipz., 1840), translated into English by A. Moriarty, under the title of 'History of Frederic the Great' (Lond. 1844); 'Beschreibung der Kunst-Schätze von Berlin und Potsdam' (1840) ('Description of the Art-treasures in Berlin and Potsdam'), a work of much more labour and research than its title would indicate; 'Karl Friedrich Schinkel: eine Charakteristik seiner Künstlerischen Wirksamkeit' ('Schinkel: the influence of his Theories of Art'), 1842; 'Handbuch der Kunstgeschichte' (Stuttg. 1842), a distinct work from the 'Handbuch der Geschichte der Malerei.' Both these works appeared at Stuttgart in 1848, where also was published (1845-53) a folio atlas of plates to illustrate his histories of art. For more than twenty years Dr. Kugler has lectured in the University of Frederick William, as well as in the Royal Academy of Berlin.

KUPETZKY, JOHANN, a celebrated portrait painter, was born at Bösing, or Bozin, near Presburg in Hungary, in 1666 or 1667. His father, originally of a Bohemian family, was a poor weaver, and he intended his son to follow his own business; Kupetzky however fled from home when only fifteen years of age, begged his way to Switzer-

land, and there, at Lucerne, obtained admission into the house of a painter of the name of Klaus, who instructed him in painting, and was soon surpassed by his pupil. Kupetzky, after a time, found his way to Rome, where he underwent many hardships until he was relieved and introduced by his friend J. C. Füßli to the principal painters and virtuosos at Rome. Alexander Sobiesky became a valuable patron to him. After a stay of twenty-two years in Italy he was invited by the Prince Adam von Lichtenstein to Vienna, where he soon obtained the reputation of the first portrait painter of his time. He numbered among his patrons and admirers the emperors Joseph I. and Charles VI., and the Prince Eugene; and in 1716 he was invited by Peter the Great to Carlsbad. Peter wished Kupetzky to enter his service and to return with him to Petersburg, but Kupetzky was fond of his liberty, and would never enter the service of any prince. The Czar Peter gave him many commissions notwithstanding his refusal to enter his service. Kupetzky, who belonged to the sect called the Bohemian Brothers, requested of the emperor of Austria that he might be allowed to worship God in his own way. This liberty however very nearly involved him in serious difficulties, as he was accused, or threatened to be accused, by some of his rivals, of malignant heresy. Fear of the Inquisition appears to have taken possession of him, and he secretly left Vienna and settled in Nürnberg, where he died in 1740. Kupetzky painted history and portrait, but chiefly portrait. His pictures have a great deal of character and much effect: his friend and admirer Füßli goes so far as to say they combine the vigour of Rubens, the truth and elegance of Vandyck, and the effect of Rembrandt. Many of his portraits and some of his pictures have been engraved, especially by Bernhard Vogel, in mezzotint. The prints engraved by Vogel were added to by V. D. Preissler and published in a collection in folio at Nürnberg in 1745, under the following title:—'Joannis Kupetzky, incomparabilis artificis, Imagines et Picturæ quotquot earum haberi poterunt, antea ad quinque decades arte quam vocant nigra æri incisæ, a Bernhardo Vogelio, jam vero similiter continuatæ opera et sumptibus Valentini Danielis Preissleri, Chalographi.' Kupetzky's portrait of himself, in spectacles, a work of remarkable merit, has been copied by L. de Laborde, from Vogel's print, and is inserted as a specimen in his history of mezzotint engraving.—'Histoire de la Gravure en Manière Noire.' J. C. Füßli published a life of Kupetzky, with one of Rugendas, at Zürich, in 1758.

KUSTER, LUDOLF, was born in 1670, at Blomberg in Westphalia. He studied at Berlin, and afterwards visited various parts of Europe, where he became connected with the principal scholars of his age. In 1696 he published a critical dissertation on the history of Homer and his works, 'Historia Critica Homeri,' which F. A. Wolff reprinted in the first volume of his edition of Homer, 1785. Kuster went afterwards to Utrecht, where he remained some years, and contributed several papers to the 'Thesaurus Antiquitatum Romanarum' of Gronovius, and to the 'Thesaurus Antiquitatum Græcarum' of James Gronovius. While at Utrecht he also published a literary journal in Latin, 'Bibliotheca Librorum Novorum, collecta a L. Neocoro, ab Aprilii, anno 1697, ad Decembrem, 1699.' Neocorus is the Latinised form of his name, which Kuster assumed in his works according to the fashion of the times. In the year 1700 he repaired to England, where he undertook to edit a new edition of Suidas, which was published at Cambridge, 3 vols. folio, 1705. In 1707 he published at Amsterdam the 'Life of Pythagoras,' by Iamblichus; and in 1710 he produced an edition of Aristophanes, with the Scholia. James Gronovius having criticised with his customary bitterness and ill temper Kuster's 'Suidas,' Kuster replied to him in his 'Diatribæ Anti-Gronoviana, in qua editio Suidæ defenditur, itemque hæud pauca loca Hesychii emendantur, et denique quid fuerit *Æs grave* apud veteres Romanos explicatur. Accedit Diatribæ de verbo *ceruo*,' Amsterdam, 1712. In this last dissertation on the verb 'ceruo,' Kuster gave a specimen of a series of observations on the Latin language, about which he had been busy for years, but which he left incomplete at his death. This dissertation also led him into a controversy with Perizonius. About 1713 Kuster, being then at Paris, obtained from Louis XIV., through the friendship of L'Abbé Bignon, a pension of 2000 livres, and was made a member of the Academy of Inscriptions. He died at Paris in 1716. His notes on Hesychius, which he left in manuscript, were inserted by J. Alberti in his edition of Hesychius, 2 vols. folio, 1746. Kuster was one of the best scholars of his time.

- KUYP, or CUYP, ALBERT, was the son and disciple of Jacob Gerutze Kuyp, an eminent landscape painter of Dort, and a pupil of Abraham Bloemart. Jacob's works, chiefly views from nature in the environs of Dort, were highly and justly valued, and his memory was held in esteem at Dort for having founded, in 1642, the Academy of Painting of St. Luke in that town, in conjunction with J. van Hasselt, Corn. Tegelberg, and J. Grief. His son Albert was born at Dort in 1606. Though his father's disciple, his manner is very different, and he embraced a greater variety of subjects. "The pictures of this master," says that excellent critic Dr. Waagen, "are the most splendid proofs that the charm of a work of art lies far more in a profound and pure feeling of nature, in the knowledge and masterly use of the means of representation which art supplies, than in the subject itself; for otherwise how would it be possible from such monotonous natural scenery as Holland affords, where the extensive green levels are broken only by single trees and ordinary houses, and intersected by canals, to

produce such attractive variety as their pictures offer? How could it happen that so many pictures, even of eminent masters, such as J. Both and Pynaker, who represent the rich and varied scenery of Italy, have less power to touch our feelings than those of Kuyp, Ruysdaal, and Hobbima? In elevation of conception, knowledge of aerial perspective, with the greatest glow and warmth of the serene atmosphere, Kuyp stands unrivalled, and may justly be called the Dutch Claude. In the impasto, the breadth and freedom of execution, he greatly resembles Rembrandt." Though Kuyp is reckoned among the cattle-painters, all kinds of which he represented with equal truth and felicity, he likewise painted landscapes, properly so called, and sea-pieces. He excelled in everything that he attempted; and yet it is remarkable that he has been comparatively little known abroad. Scarcely anything is known of the circumstances of his life; even of the year of his death we can find no record: he was living in the early part of 1683. Kuyp's works were so low in value, that a beautiful picture of his, for which Sir Robert Peel paid 350 guineas, was bought at Hoorn, in Holland, some years ago, for one shilling English. He is a great favourite in England, and it is here that his finest works are found, chiefly in the Royal, National, Bridgewater, Grosvenor, and Dulwich Galleries, in the collections of Sir Robert Peel, Lord Yarborough, the Duke of Bedford, the Marquis of Bute, &c.

KYD, THOMAS, was one of those dramatic poets who immediately preceded Shakspeare. Three plays of his are extant—1, 'Cornelia, or Pompey the Great, his fair Cornelia's Tragedy,' a translation respectably executed, from the French of Garnier, printed in 4to, 1594, 1595;

2, 'The First Part of Jeronimo,' 1605, 4to; 3, 'The Spanish Tragedy, or Hieronimo is Mad again,' of which there are many editions, the oldest known being of 1599, though the play was certainly printed earlier. All the three are in 'Dodsley's Old Plays.' 'The First Part of Jeronimo' is merely an introduction to the 'Spanish Tragedy.' The former, and probably the latter also, must have been on the stage about the year 1587 or 1588; and they kept their place in 1601 and 1602, when Ben Jonson was paid for making large additions to the Second Part, which are in the modern editions, and are quite worthy of his genius. The portions written by Kyd himself are the objects of continual ridicule to Shakspeare and his contemporaries, whose comic characters parody the most extravagant speeches of the mad Hieronimo. Yet the play, even in its Introduction, and still more in the Second Part, possesses great vigour, both of imagination and of passion. It is an irregular and rude work, belonging essentially to the infancy of the drama, in its conception of character as well as in its plan and in its language. But it was by no means unworthy of the great popularity which it enjoyed. It is a tragedy of bloodshed, after the manner of 'Titus Andronicus,' to which however it is much inferior; and it has been observed by more than one critic, that there are in it points which may naturally enough be supposed to have suggested thoughts for 'Hamlet.' Kyd has also been supposed to have been the author of the old 'Taming of a Shrew,' 1594, and of the tragedy of 'Solyman and Perseda,' 1599. For the former supposition there is no ground; and for the other there is no better reason than the particular mention made of the story of a 'Solyman' in the 'Spanish Tragedy.'

L

LABEO, QUINTUS ANTISTIUS, a Roman of some distinction as a jurist, was the father of a more distinguished son. He was at the battle of Philippi, on the side of M. Brutus and Cassius, and after the defeat he killed himself in his tent, and was buried there. (Appian, 'Civil Wars,' iv. 135.)

Q. ANTISTIUS LABEO, the son, was a pupil of C. Trebatius; but contrary to the practice of that time, instead of devoting himself exclusively to one master, he attended several. He lived in the time of Augustus. Labeo was distinguished for his knowledge of Roman law and Roman usages, and also for the freedom with which he expressed his opinions to Augustus (Suetonius, 'Octavianus Cæsar,' c. 54), to whose measures he set himself in opposition. Some critics suppose that he is alluded to by Horace (1 'Sat.' 3. 82); but there might be other persons of the name of Labeo. Ateius Capito, his rival in legal knowledge, was raised to the consulship by Augustus in order that he might have that superiority in rank which his talents alone could not give him. Labeo never enjoyed any higher honour than the prætorship. (Tacitus, 'Annal.' iii. 75.) The character of Labeo is given by Gellius (xiii. 10): "Labeo Antistius principally applied himself to the study of the civil law, and publicly gave his opinions to those who consulted him. He was also not unacquainted with other liberal pursuits, and he deeply studied grammar, dialectic, and ancient learning; he was also well acquainted with the origins and principles of Latin words, and he availed himself of that kind of knowledge especially to clear up most legal difficulties." He was confident in his abilities and acquirements, and bold enough to advance many new opinions. He was a copious writer, and is said to have produced four hundred different treatises, from which there are sixty-three excerpts in the Digest, and he is very often cited by the other jurists. Labeo wrote commentaries on the Twelve Tables, fifteen books at least on Pontifical Law, and fifteen De Disciplinis Etruscis. His works which are mentioned in the Digest are, eight books of *Περὶ τῶν*, of which Paulus made an epitome with notes; and ten books of *Posteriora*, so called from having been published after his death, of which Javolenus made an epitome; but Gellius refers to the fortieth book of *Posteriora*. He also wrote *Libri ad Edictum*, *Libri Prætoris Urbani*, and thirty *Libri Prætoris Peregrini*.

A brief notice of C. ATEIUS CAPITO may be appropriately introduced here, for he was the rival of Labeo, and founded a sect or school which was opposed to that of Labeo. The father of Capito attained the rank of prætor; his grandfather was a centurion who served under L. Cornelius Sulla. Capito was made Consul Suffectus by Augustus A.D. 758, and it was during his term of office that he decided that a patron could not take his freedwoman to wife against her consent, a decision perfectly consistent with Roman principles. Capito was a flatterer; Labeo was an independent man and said what he thought. Instances of Capito's adulation are recorded by Tacitus ('Annal.' iii. 70) and Suetonius. He died in the time of Tiberius, A.D. 22. ('Annal.' iii. 75.)

Capito is often cited by other jurists, Proculus, Javolenus, Paulus, and once by Labeo; they always call him Ateius. Capito's reputation as a lawyer was very great. He wrote on Pontifical Law at least five books, as appears from Gellius (iv. 6), and numerous books of *Conjectanea* (Gellius, ix. 2; xiv. 7). He also wrote a single book *De Officio Senatorio*, from which Gellius gives an extract (iv. 10), and a book *De Jure Sacrificiorum* (Macrobius, 'Saturn.' iii. 10). Gellius (xiii. 12)

also quotes a letter of Capito, in which he speaks highly of Labeo's legal knowledge. There are no excerpts from Capito in the Digest.

From the time of Labeo and Capito we date the formation of two opposed sects or schools of law among the Romans. The nature of this opposition is collected from the words of Pomponius ('Dig.' i. tit. 2). Labeo was a man of greater acquirements than Capito and of a bolder temper. He applied to his legal studies the stores of knowledge that were open to him, and thus was led to many new views. Capito stuck close to what had been transmitted by his predecessors: he was one of those who appealed to authority. So far as concerns general principles, we cannot condemn the method of either of these great jurists. Each has its merit, but either of them, if carried too far, may be injurious to jurisprudence. He who handles the matters of law in an enlarged and comprehensive manner may improve jurisprudence; but if he does not well know what the law is, and if he is more eager to change what is established than to maintain its stability, he may destroy the edifice on which he is labouring. He who merely studies the laws of his country as they exist, and is satisfied if he can find authority for anything, however inconsistent with fair dealing and the general interests of society, may be a good lawyer of a kind, but he is a bad citizen. The Roman jurists-consulti were mainly engaged in writing on law and giving their opinions (responses) to all persons who consulted them. Their business was not that of the modern advocate, who has to make the best of his client's case. The opposition then between Labeo and Capito, between him whose method, if judiciously practised, would lead to a progressive improvement of law, and him whose method would stop all such improvement, if strictly adhered to, hardly constitutes a ground of like comparison between lawyers in this country.

The followers of Labeo were called Proculiani, from Proculus, one of the successors of Labeo. Those who attached themselves to the school of Capito were called Sabiniani, or sometimes Schola Cassiana, from Massurius Sabinus and C. Cassius Longinus. For further remarks on the subject of the two schools the reader may consult Puchta, 'Cursus der Instit.' i. 93.

LABIENUS. [CÆSAR.]

LABORDE, COMTE ALEXANDRE-LOUIS-JOSEPH DE, was born on the 17th of September 1773, at Paris. His father, a peasant of Béarn, is stated to have come to Paris in sabots (wooden shoes), and to have accumulated some property. Alexandre de Laborde received a good education. His father, foreseeing the dangers of the Revolution, sent him to Vienna, where he became successively sub-lieutenant, captain, aide-de-camp, and commander of a squadron of light horse. His father became one of the victims of the revolution, and was guillotined in 1794. When war was declared between France and Austria, Alexandre de Laborde continued in the service of Austria, and fought in five campaigns against his native country. After the treaty of Campo Formio in 1797 he returned to France and devoted himself to study. He travelled in Spain, Italy, and England. After his return to France he solicited and obtained employment from Napoleon I. in the civil service. In 1803 he was appointed Auditeur to the Conseil d'État. In 1809 he became Maître des Requêtes to the Conseil d'État, and was created a Chevalier of the Legion of Honour. In 1810 he was made President of the commission for the liquidation of the debts of the grand army, and in 1811 Administrateur of the Ponts et Chaussées for the department of the Seine. In 1814 he was

appointed Adjutant-Major of the National Guard of Paris, and on the 31st of March in that year he was sent to the camp of the allied army to treat of the capitulation as far as regarded the National Guard. After his return he was appointed Colonel of the *État-Major* of the National Guard, and received from Louis XVIII. the cross of St. Louis and that of the Legion of Honour. He afterwards travelled again in England. On his return to France in 1815 he published a 'Plan d'Éducation pour les Enfants Pauvres, d'après les Méthodes combinées de Bell et de Lancaster,' and was during three years Secretary-General to the Central Society which founded the system of mutual instruction in France. In 1816 he published a 'Rapport sur les Travaux de la Société de Paris pour l'Instruction Élémentaire.' In 1819 he was appointed Maître des Requêtes en Service Ordinaire. In 1822 he was elected a member of the Chamber of Deputies by the Collège de la Seine, and spoke frequently and fervently in favour of liberal institutions. He opposed the war with Spain, and in 1824 was struck off the list of the Conseil d'État. Having been again elected a member of the Chamber of Deputies in 1827, he opposed the Martignac ministry, and was also one of the opposition during the Polignac ministry. When the ordinances of July 1830 were promulgated he spoke against them decidedly and energetically, declared himself in favour of the insurrection, and risked his life in the popular cause on the 27th of July. On the 29th he advised the deputies to place themselves at the head of the movement; and when the Hôtel de Ville was taken by the insurrectionists he was one of those who proposed that the sittings should be held there. The contest having been decided in favour of the people, he accepted the post of Prefect of the Seine, or first magistrate of Paris. Louis-Philippe soon afterwards appointed him one of his aides-de-camp, with the rank of General of Brigade of the National Guard, and restored him to his place in the Conseil d'État. He was afterwards a deputy for the department of Seine-et-Oise. He died on the 24th of October 1842.

Count Alexandre de Laborde was elected a member of the Institute (Académie des Inscriptions et Belles Lettres) in 1813. He was also a member of the Académie des Sciences Morales et Politiques (section d'Économie Politique), and of the Society of Antiquaries of London. He was one of the editors of the 'Revue Encyclopédique' from its commencement. He was also a contributor to the 'Univers Pittoresque' (departments of Spain and Portugal), and to the 'Journal des Connaissances Utiles.' Besides his contributions to periodical literature, he was the author of several splendid works, of which the following are the most important:—'Voyage Pittoresque et Historique de l'Espagne,' 4 vols. folio, Paris, 1807-18. 'Itinéraire Descriptif de l'Espagne,' 5 vols. 8vo, Paris, 1808, with Atlas in 4to. The third edition was considerably enlarged, and was preceded by a 'Notice sur la Configuration de l'Espagne, et de son Climat, par M. de Humboldt, et d'un Aperçu sur la Géographie Physique, par M. le Colonel Bory de Saint-Vincent, et d'un Abrégé Historique de la Monarchie Espagnole et des Invasions de la Péninsule jusqu'à nos Jours,' with vignettes, maps, &c. 'Voyage Pittoresque en Autriche,' 2 vols. folio, Paris, 1821. 'Collection des Vases Grecs de M. le Comte de Lambert,' 2 vols. folio, Paris, 1813-24, containing 154 plates printed in colours and carefully retouched. 'Les Monuments de la France classés chronologiquement, et considérés sous le Rapport des Arts,' 2 vols. folio, Paris, 1832-36, containing 259 plates, originally published in 45 numbers, 1816, &c. 'Description des Obélisques de Louqsor, figurés sur les Places de la Concorde et des Invalides, et Précis des Opérations relatives au Transport d'un de ces Monuments dans la Capitale,' 8vo, Paris, 1834. 'Voyage de la Syrie,' in conjunction with his son Comte Léon de Laborde. 'Versailles, Ancien et Moderne,' 8vo, Paris, 1839-40, with upwards of 400 woodcuts.

*LABORDE, COMTE LÉON-EMMANUEL-SIMON-JOSEPH DE, was born June 13, 1807, at Paris. He is the son of Count Alexandre de Laborde. In the year 1828 he was appointed secretary to the legation at Rome, but resigned this office when M. de Polignac came into power under Charles X. After the Revolution of July 1830 he became aide-de-camp to General La Fayette, and was sent to London as secretary to the embassy. In 1832 he went in the same capacity to the Hague, and in 1834 to Cassel. He succeeded his father as deputy for the department of Seine-et-Oise, and is a member of the Institute (Académie des Inscriptions et Belles Lettres), and an officer of the Legion of Honour. He is at present Conservator of the collections of the Middle Ages and the Renaissance in the Museum of the Louvre. He has, like his father, distinguished himself by the publication of magnificent works descriptive of foreign countries, as well as by his archaeological investigations. The following are the most important of these works:—'Voyage dans l'Arabie Pétrée,' 8vo, Paris, 1830-33, with Plates and Atlas in folio. 'Voyage en Orient,' illustrated by about 400 views in Asia Minor and Syria, folio, 1837, &c. 'Histoire de la Gravure en Manière Noire,' 8vo, Paris, 1839. 'Débuts de l'Imprimerie à Strasbourg, ou Recherches sur les Travaux Mystérieux de Gutenberg dans cette ville, et sur le Procès qui lui fut intenté en 1439 à cette Occasion,' 8vo, Paris, 1840. 'Le Parthenon: Documents pour servir à une Restauration,' folio, Paris, 1843, &c. 'Les Ducs de Bourgogne; Études sur les Lettres, les Arts, et l'Industrie pendant le 15ième Siècle, et plus particulièrement dans le Pays Bas et le Duché de Bourgogne,' 8vo, Paris, 1849, &c. 'Essai d'un Catalogue des Artistes originaires des Pays Bas, ou employés à la Cour des Ducs de

Bourgogne, au 15ième et 16ième Siècles,' 8vo, Paris, 1849. 'La Renaissance des Arts à la Cour de France: Études de la 16ième Siècle,' 8vo, Paris, 1850, &c. 'Notice des Émaux exposés dans les Galeries du Musée du Louvre,' 12mo, Paris, 1852, &c. 'Mémoires et Dissertations,' 4to, Paris, 1852.

LABORDE, JEAN-BENJAMIN, a voluminous writer on the history of music, was born in Paris in 1734, of a rich family, and received a liberal education, including music, which he studied under the celebrated Rameau. He was intended for the financial department of government, but his inclination prompted him to seek admission to the gay court of Louis XV., to whom he was appointed 'premier valet de chambre,' and soon becoming the favourite and confidant of that prince, was, as a matter of course, led into great extravagance and dissipation. But a passion for music saved him from much of the evil that most likely would otherwise have ensued from his connection with a profligate monarch and a vicious court: he composed several operas, and these, though possessing little merit, proved successful, and occupied time which, in all probability, would have been devoted to less innocent pleasures. On the death of Louis, in 1774, M. Laborde resigned his office, married, and entered into a life of comparative tranquillity. He became one of the 'fermiers-généraux,' devoted his spare hours to study, and, in 1780, published his 'Essai sur la Musique Ancienne et Moderne,' in four 4to volumes, a splendid work, got up at a vast expense, embellished by a great number of remarkably well executed engravings, and illustrated by numerous examples of French national music in various forms. It contains an abundance of information, drawn with great labour from authentic sources, and though exhibiting occasional prejudices, and so desultory that it ought to have been entitled a Collection of Essays, rather than an Essay, it has supplied with facts and materials writers—some of them of no mean reputation—who have not had the candour to acknowledge the slightest obligation.

The French revolution brought in its train the ruin of M. Laborde. A 'farmer-general' could expect no favour from those whom the new order of things had placed in power; he therefore withdrew into the country, and lived concealed till the indiscretion of a person intimately connected with him made his retreat known. He was conveyed to Paris, tried, condemned, and guillotined on the 20th of July 1794, just five days before the fall of Robespierre and his sanguinary colleagues.

The great pecuniary resources of M. Laborde, together with his activity and indefatigable industry, enabled him to publish, in a sumptuous manner, many original works; also some translations from the English. Among the former are:—an 'Essai sur l'Histoire Chronologique de plus de 80 Peuples de l'Antiquité,' 2 vols. in 4to; a 'Description générale et particulière de la France,' in folio; and 'Tableaux Topographiques, Géographiques, Historiques, &c., de la Suisse,' 4 vols. in folio.

LA BRUYÈRE. [BRUYÈRE, JEAN LA.]

LA CAILLE, NICHOLAS-LOUIS DE. The following account is almost entirely from Delambre, either from the memoir by him inserted in the 'Biographie Universelle,' or the 'Hist. de l'Astron. au 18ième Siècle.' There are two éloges, one by Grandjean de Fouchy, the other by G. Brotier, prefixed to the 'Cœlum Australe.' As Delambre knew of these éloges, we have not thought it necessary to examine them.

La Caille was born at Rumigny, near Rosoy, in Thierache, March 15, 1713. His father, a retired military officer, was in the service of the Duchess of Vendôme, and was himself attached to science, and endeavoured to cultivate the same taste in his son. He died however while the latter was at the College of Lisieux, and his son was enabled to continue his studies by the generosity of the Duke of Bourbon. He chose theology as his profession; but in passing his first examination he showed so much frankness in his answer to some questions proposed by a doctor of the old school, that this examiner would have refused him his degree but for the remonstrances of the rest. This incident discouraged him, and he remained content with the title of abbé, beyond which he never proceeded. He had previously turned his attention to astronomy under great disadvantages; and upon his renunciation of theology, Fouchy, above mentioned, who relates that his knowledge of astronomy was above all comprehension in so young a person, introduced him to James Cassini, who gave him employment at the Observatory. In the following year, and in conjunction with Maraldi, he made a survey of part of the coast of France, where the talent which he showed occasioned his being employed in the verification of the arc of the meridian. This operation (in which Cassini de Thury was associated) commenced at the beginning of May 1739, and before the end of the year he had completed the triangulation from Paris to Perpignan, had measured three bases, made the requisite astronomical observations at three stations, and had taken a prominent part in the measurement of a degree of longitude. In the winter of 1740 he extended his operations to the mountains of Auvergne, in order to test some suspicions which he had formed upon the accuracy of Picard's measurement. The result of these labours was the complete establishment of the gradual increase of the degree in going from the equator to the poles; which, though long known to be theoretically true, had not previously been confirmed by measurement. In the meanwhile La Caille had been appointed to a chair of mathematics in the Mazarin College, the duties of which he fulfilled with care, and for which he published treatises on geometry, mechanics, astronomy, and optics.

He was also employed in the calculation of ephemerides, and in that of eclipses for 1800 years, published in the 'Art de Vérifier les Dates.' In 1746 an observatory was constructed for him at his college, and he began observations on a large scale. The transit instrument being then but little used in France [CASSINI], he had no means of judging of its value; so that with old methods and old instruments he continued his career for fourteen years. In 1751 he made his celebrated voyage to the Cape of Good Hope, where he remained four years or something less. His object was to form a catalogue of southern stars, and up to the present time his results have been in use. He determined the places of about ten thousand stars, and grouped them in constellations; measured a degree of the meridian at the Cape, and made a survey of the Mauritius and island of Bourbon. He received for his expenses and those of a clockmaker who accompanied him, all instruments included, 10,000 francs; and so accurately did he keep his accounts, that he was able to explain his expenditure to a sou: it was 9144 francs and five sous, and he insisted on returning the balance in spite of the disinclination of the officers of the treasury to receive it. He returned to Paris in 1754, and occupied himself in the preparation of his 'Fundamenta Astronomiæ,' for the publication of which he engaged to furnish a bookseller with almanacs for ten years. He now began to use the transit instrument, but with so much doubt of its accuracy, and consequent repetition of observations, that, according to Delambre, the secondary stars observed by him at this time were determined with a degree of accuracy superior to that of the fundamental stars of other observatories. He also published the posthumous works of Bouguer, a small table of logarithms, and various observations. At the end of 1761 he was seized with gout, but he remained during the winter employed in his observatory, passing most nights upon cold stones in the act of observing: a fever was the consequence, and he died March 21, 1762, aged forty-nine years. His last act was the return of the instruments which he had borrowed, and the commission of his manuscripts to his friend Maraldi.

La Caille was an astronomer whose observations will have the highest value as long as astronomy is cultivated, which cannot be said of others, his superiors in originality of discovery. Lalande said of him that he alone had made more observations than all his contemporaries put together, which Delambre states would be no exaggeration if spoken of the twenty-seven years during which he laboured; but though his utility was much increased by his extraordinary activity, industry, and honesty, yet his reputation was still more indebted to the genius which he displayed in producing exactness out of imperfect instruments. Delambre remarks that the repeating circles of Lenoir and Reichenbach have not been able to correct the latitude of the Observatory of Paris as determined by La Caille. He also says:—"Having been called upon by singular conjunction of circumstances to go over and verify a great part of the labours of La Caille, after having reviewed with the greatest care all his stars, made long researches on refraction, constructed new solar tables, measured the meridian of France, and had in my hands for many years all the manuscripts of La Caille, I never followed him one step of his track without feeling increased admiration and esteem for a savant who will always be the honour of French astronomy." Delambre is, as we have seen, a severe critic in all quarters, and never shows much, if any, national bias in great questions: an éloge from him is history.

The writings published by La Caille are as follows:—1745-54, 'Ephemerides,' 1746, 'Leçons Élémentaires d'Astronomie, Géom., et Phys.,' reprinted in 1755, 1761, and in 1780, with notes by Lalande; translated into English by Robertson, 1750; his first observations for 1743 are in the 'Memoirs' of the Academy, which appeared in 1748; 1750, 'Leçons Élémentaires d'Optique,' a work which maintained its ground a long time, but only for want of a better; 1750, 'Avis aux Astronomes,' &c., a pamphlet recommending the corresponding observations to be made in Europe while he was in the south; 1753, 'Observations made at the Cape for Parallax of Moon, Mars, and Venus; 1755-64, 'Ephemerides,' on the model of which, according to Lalande, our 'Nautical Almanack' was constructed; 1757, 'Fundamenta Astronomiæ,' among many other things this contains a catalogue of 397 stars (northern), of which Delambre says that it cost more trouble than any other catalogue ever gave its author; 1758, 'Tabulæ Solares,' the best up to the time of Delambre and Zach. But the first work of La Caille (according to Delambre, and omitted by Lalande) was an edition of, or commentary on, the tract of Cotes, entitled 'Estimatio Errorum, &c.,' the first attempt to apply the theory of probabilities to the determination of the most probable mean of observations. La Caille was an astronomer who made his own head supply the deficiencies of his workmen's hands.

The posthumous works of La Caille were as follows:—1765-74, 'Ephemerides,' containing also a catalogue of 515 zodiacal stars; 1763, 'Journal Historique du Voyage fait au Cap de Bonne Espérance; 1763, 'Cosmum Australe Stellarum,' the record of his observations in the southern hemisphere. It contains observations of more than ten thousand stars, with a catalogue of 1942 principal stars, which catalogue is also in the 'Memoirs' of the Academy for 1752.

LACÉPÈDE, BERNARD GERMAIN ÉTIENNE, DE LA VILLE, COMTE DE, a celebrated French naturalist, was born at Agen, chief town of the department of Lot-et-Garonne, on the 28th of December 1756. His father, Jean Joseph Médard de la Ville, held a high legal

appointment (lieutenant-general of the Sénéchaussée) at Agen, and was descended from an ancient and noble family. Young Lacépède lost his mother at an early age, and from a great resemblance which he bore to her he was doted on by his father, who brought him up at home, and freely allowed him to cultivate a taste which he showed for reading by letting him have free access to a good library. He thus acquired romantic notions and a generous unsuspecting disposition, which all the changes of a long and eventful life never effaced, and which sometimes led him into error, inducing him to believe improbable circumstances rather than doubt the veracity of an author. Among other books, he met with Buffon's 'Histoire Naturelle,' which he read over and over till he knew it by heart, and thus gained a taste for natural history from the works of this fascinating writer, whom he henceforth took for his master and his model. While at home he imbibed a fondness for music, in which science he became a proficient; he also applied himself with ardour to the study of physics and natural philosophy, and formed with some of his young companions a juvenile academy, many members of which became afterwards members or correspondents of the Institute. Having made some experiments on electricity, and collected, as he thought, some important facts and observations, he wrote a memoir on this subject, and sent it to Buffon, who returned him such a flattering answer that on the reception of it he set off immediately for Paris, where Buffon then held the appointment of superintendent of the Jardin-du-Roi. He was at this time about twenty years old, and wished to devote himself entirely to the pursuit of science and music; but his friends insisted on his following some profession, and accordingly he obtained a commission in the army. He got attached however to a regiment where he had nothing to do, and which he hardly ever saw, though it served for a nominal employment. At this time he assiduously cultivated his musical talents, and published an opera for the stage, which, though favourably received at first, was not ultimately successful, and from this time he only followed this study for his private amusement.

In 1781 he published an essay on natural and artificial electricity, and in 1782 a treatise on physics, entitled 'Physique Générale et Particulière.' These works were full of ingenious hypothesis and clever reasoning, but the theories which they contained were not based on facts, and they did not meet with success. Buffon however, on whose model they were written, was so much pleased with them that he became from this time the intimate friend and instructor of Lacépède, who was now the first and favourite pupil of Buffon and Daubenton. Buffon proposed to him to continue his 'Natural History,' and in 1785 offered him the appointment of curator and sub-demonstrator in the Cabinet du Roi. He gladly left the army and accepted it, though a laborious situation. He now applied himself with energy to natural history, and published his 'Histoire Naturelle des Quadrupèdes Ovipares et des Serpents' in 1788-89; the last part came out after Buffon's death, which took place in 1788. Cuvier says, "This publication, by its elegance of style, and the interesting facts it contains, was worthy of the immortal work of which it forms the continuation; it marks the change of ideas and progress of science which had taken place during the forty years which had elapsed since the 'Histoire Naturelle' of Buffon first appeared." M. Lacépède however had not the antipathy of his master to precise methods and nomenclature; he formed classes, orders, and genera, which he clearly characterised, as well as strictly defined many species; but his arrangement was, like that of Linnæus, artificial and unphilosophical, founded only on external characters, without reference to internal organisation. After the death of Buffon, when France became disturbed by the national convulsions of the revolution, Lacépède took an active part in political affairs; he was successively invited to fill the posts of president of Paris, commandant of the national guard, and deputy extraordinary for the town of Agen in the Legislative Assembly of 1791, of which he was elected president. With many others he got out of favour in the following year, and narrowly escaped destruction during the reign of terror, being obliged to secrete himself for some time. When the Jardin-du-Roi was converted by the Convention into a public school, and named the Museum of Natural History, he returned there, and in 1795 a new chair of zoology was created for him, in which he lectured on reptiles and fishes with great success. In 1798 he brought out the first part of his 'Histoire Naturelle des Poissons,' which Cuvier pronounced to be a very good performance considering the disadvantages under which he laboured in getting specimens, and the imperfect knowledge of the organisation of these animals at that time. In 1804 his 'Histoire Naturelle des Cétacés' was published, which he correctly estimated as the best of his writings. After this period he wrote no large work, though he contributed numerous memoirs to the 'Annales du Muséum,' the 'Mémoires de l'Académie des Sciences,' and other publications. A great deal of his time was spent in public business. In 1799 he was elected a member of the senate, and was made president in 1801. From 1803 till the Restoration he filled the office of grand chancellor of the Legion of Honour. He was a member of the Institute at the time of its formation, and afterwards of the Academy of Sciences. He died on the 6th of October 1825. Cuvier says that he was always distinguished by excessive politeness and courteousness of manner, with which however he combined great kindness of heart, and that

his works show him to have been a profound observer and an elegant writer. We here subjoin the titles of his principal works, but for a complete enumeration of his literary contributions we refer to Cuvier's 'Éloges,' where a good biographical memoir of Lacépède will be found:—

'Histoire Naturelle, Générale, et Particulière, des Quadrupèdes Ovipares et des Serpents,' 2 vols. 4to, Paris, 1788-89, translated into German by Bechstein, 8vo, Weimar, 1802; 'Histoire Naturelle, &c., des Poissons,' 5 vols. 4to, Paris, 1798-1803, translated into German, 2 vols. 8vo, Berlin, 1804; 'Éloge Historique de Daubenton,' 8vo, Paris, 1790; 'Histoire Naturelle, &c., des Cétacés,' 4to, Paris, 1804.

LACHMANN, KARL, professor in the University of Berlin, and member of the Academy of Sciences, occupied a high rank among the critics and philologists of Germany. He was born at Brunswick, on the 4th of March 1793. In that town he received his early education, and under his teacher Konrad Heusinger was first awakened his love for literature. For one session, in 1809, he attended the lectures of Hermann in the University of Leipzig, and next pursued his studies in that of Göttingen, where, in conjunction with Dissen, Schulze, and Bunsen, he founded a philological society in 1811. While at Göttingen, Benecke lectured upon the old German literature, which probably directed Lachmann's attention more particularly towards it, and at a later period led to much valuable criticism upon and editions of many of the early German writers. During the short war occasioned by Bonaparte's return from Elba to France, in 1815, Lachmann served as a volunteer in the Prussian service, in which he continued till the end of that year. In 1816 his edition of Propertius, which he had prepared at Göttingen, was published at Leipzig; and at Easter of that year he read his probational essay before the University of Berlin, 'Ueber die ursprüngliche Gestalt des Gedichts von der Niebelungen Noth' ('On the Original Form of the Poem on the Niebelungen Calamities'). After this he was appointed, in rapid succession, teacher at the Gymnasium and professor at the University of Königsberg, and professor of the University of Berlin, the last promotion being attained in 1827. Highly esteemed as an academic teacher, and sedulous in the discharge of his duties, he nevertheless actively continued his literary labours. Many of these were critical or philological essays contributed to periodical works. Of his distinct works, the more important have been his essays on the Niebelungen Lied and on Homer ('Betrachtungen über die Ilias'), which are both masterly specimens of criticism. His last was the substance of two lectures delivered before the Berlin Academy in 1838 and 1841. In 1834 and 1842 he published two editions of the New Testament, the last with the Vulgate translation, in which he endeavoured to restore the text to that of the 3rd and 4th centuries. In the classical department he published: 'De choricis systematis tragicorum Græci,' Berlin, 1819; and 'De mensura tragediarum,' Berlin, 1822; with carefully-prepared editions of Catullus, Tibullus, Terence, Babrius, and Avianus, at intervals from 1829 to 1845; one of Caius, so important to the students of the Roman jurisprudence, in 1841; and essays upon Dositheus and Ulpian in the ninth volume of Savigny's 'Zeitschrift.' Most of these works have gone through more than one edition. His attention however was never diverted from the early literature of the north of Europe. In 1816 he translated the first volume of P. E. Müller's 'Sagabibliothek,' in 1820 a selection from the High-German poets of the 13th century; in 1826 an edition of the 'Niebelungen Lied,' in 1827 an edition of the poems of Walther von der Vogelweide; in the same year, in conjunction with Benecke, an edition of Hartmann's 'Iwein'; in 1833, an edition of the poems of Wolfram von Eschenbach; in 1838, Hartmann's 'Gregor,' and the poems of Ulrich von Lichtenstein in 1841. These were all prepared with great care, and accompanied with valuable remarks. He also contributed numerous papers to the 'Rheinischen Museum,' and read others before the Berlin Academy. The most noticeable are 'Ueber althochdeutsche Betonung und Verkunst' ('On the Early High German Accentuation and Versification'), 'Ueber Singen und Sagen,' and 'Ueber das Hildebrandslied.' He also published an excellent critical edition of Lessing's collected works, in 13 vols., Berlin, 1838-40; and an edition of Klenze's 'Philological Essays.' Lachmann is likewise the author of a translation of Shakspeare's sonnets, published in 1820; and of 'Macbeth,' published in 1839. He died in March 1851.

LA CONDAMINE, CHARLES MARIE, was born at Paris on the 28th of January 1701. Upon leaving college he entered the army as a volunteer, and forthwith proceeded to take part in the siege of Rosas, where his intrepidity soon rendered him conspicuous; but on the re-estoration of peace, finding the expectations of promotion which he had previously entertained not likely to be realised, he quitted the military profession, and in 1730 entered the Academy of Sciences as assistant-chemist ("adjoint-chemist"). Shortly after this he embarked in an expedition to the Mediterranean, having for its object the exploration of the coasts of Asia and Africa, and while absent visited Troas, Cyprus and Jerusalem, and passed five months at Constantinople. Upon his return to Paris the Academy were busily occupied in discussing the arrangements for a voyage to the equator for the purpose of measuring an arc of the meridian, with a view to the more accurate determination of the dimensions and figure of the earth. From the first mention of this project La Condamine directed his attention to

every branch of science connected with it. "The very desire," says Condorcet, "of being connected with so perilous an undertaking, made him an astronomer." His proposals having been accepted by the Academy, who felt how much his natural zeal and courage might tend to the success of the expedition, he again (1735) took leave of his country in company with Messieurs Bouguer and Godin, and proceeded to Peru. The fatigue and hardships which they had to encounter till their return in 1743, and which were heightened by the discord and jealousy which rose up among them, have been already noticed. [BOUGUER.] Upon his return he published 'An Account of a Voyage up the Amazon,' 1745; and in the same year, an abridged account of his 'Travels in South America.' His work entitled 'The Figure of the Earth as determined by the Observations of Messieurs de la Condamine and Bouguer,' did not appear till 1749. In 1747 he proposed to his government the adoption of the length of the seconds' pendulum as an invariable unit of measure. In 1748 he was elected a Fellow of the Royal Society of London, and in 1760 a member of the Academy of Sciences of Paris. In 1763 La Condamine and Lalande formed part of the deputation appointed by the Academy to be present at the making of the Report of the Royal Society concerning the inventions of Harrison for facilitating the finding of the longitude. He died on the 4th of February 1774, while undergoing an experimental operation for the removal of a malady contracted in Peru. Always occupied, he appears to have needed time to feel his misfortunes, and notwithstanding his sufferings he appears never to have been unhappy. His wit, the amiability of his temper, and the celebrity of his travels, made him many friends, and his humour was generally successful in blunting the attacks of enmity. His curiosity and love of distinction urged him on in the pursuit of information, and ultimately led to his carrying on a correspondence with the learned of all nations upon almost every subject.

The principal works of La Condamine which have not already been mentioned are, 'Measure of the First Three Degrees of the Meridian in the Southern Hemisphere,' 1751; 'History of the Pyramids of Quito,' 1751; 'Journal of the Voyage to the Equator,' 1751; besides numerous scientific memoirs in the 'Transactions of the Academy of Sciences of Paris, and in those of the Academy of Berlin.

(Condorcet, *Éloge de la Condamine*, Paris, 1804, tome i.; Biot, *Notice of the Life of Condamine*; *Biog. Univ.*; *The Works of Condamine*; Thomson, *Hist. of the Royal Society*.)

LACTANTIUS, (LUCIUS CÆLIUS, or CÆCILIUS FIRMIANUS LACTANTIUS), one of the early Latin fathers, was a scholar of Arnobius, who taught rhetoric at Sicca in Africa. He lived at the end of the 3rd and the beginning of the 4th century. His native country is uncertain, but he is generally supposed to have been an African. On the invitation of Diocletian, he went to Nicomedia, where he taught rhetoric. He became afterwards preceptor to Crispus, the son of Constantine, in Gaul. The time of his death is not satisfactorily ascertained.

His chief work is the 'Divine Institutions,' in seven books, written in reply to two heathens who wrote against Christianity at the beginning of Diocletian's persecution. The date of the composition of this work cannot be exactly fixed. Basnage, Du Pin, and others place it about 320; Cave and Lardner about 306; Lardner states the arguments on both sides in his 'Credibility;' and, on the whole, the latter opinion seems the more probable. Du Pin has given an analysis of the 'Institutions.' The other extant works of Lactantius are, an 'Epitome of the Divine Institutions;' the first five books of which were not known in Jerome's time, but were discovered and published by Paff in the year 1712; a treatise on the 'Workmanship of God;' a treatise on the 'Wrath of God,' and a work entitled 'Symposion,' which he wrote when he was very young. He also wrote an 'Itinerary from Africa to Nicomedia,' a work entitled 'Grammaticus,' two books to Asclepiades, and eight books of Epistles, all of which are lost. A work on the 'Deaths of Persecutors' is ascribed to Lactantius, but its genuineness is much disputed.

The testimony to his learning, eloquence, and piety is most abundant. Le Clerc calls him the most eloquent of the Latin fathers, and Du Pin places his style almost on a level with Cicero's. Many writers however value his rhetoric more than his theology. He has been charged, among other errors, with Manichæism, from which Lardner takes great pains to defend him.

Complete editions of his works were published by Heumann at Göttingen in 1736 (the preface to this edition contains a catalogue of former editions); and by the Abbé Lenglet, 2 vols. 4to, Paris, 1748.

LAENNEC, RENÉ-THEOPHILE-HYACINTHE, was born at Quimper, in Lower Brittany, in 1781. The first part of his medical education was conducted by his uncle, Dr. Laennec, a physician of repute at Nantes, and in 1800 he went to Paris, where he attended the several medical courses, and attached himself to the Hôpital de la Charité, of which Corvisart was the chief physician. In 1814 he took the degree of Doctor of Medicine, being already distinguished as well for his literary acquirements as for his professional industry and talent. In the same year he became chief editor of the 'Journal de Médecine,' to which he had communicated several excellent papers, both on healthy and morbid anatomy. Having obtained considerable reputation, both in private practice and by his lectures

and writings, he was appointed in 1816 chief physician to the Hôpital Necker, and it was there that he soon after made the remarkable and important discovery of mediate auscultation. From this time he devoted himself unceasingly to the perfecting of his new system of diagnosis. In June 1818 he read his first memoir on it to the Academy of Sciences, and in the following year he published his 'Traité de l'Auscultation Médiate.' But the labour necessary for its accomplishment so injured his health, which was naturally very delicate, that he was immediately afterwards obliged to resign all his studies as well as a large private practice, and to leave Paris for his native province. He returned in 1821, with his health restored, and having resumed his duties, he was soon after appointed professor of medicine in the College of France. In 1822 he was chosen professor of clinical medicine, and he regularly delivered the lectures at La Charité till 1826, when, after the publication of a second edition of his work, his health again failed him. Indications of consumption were discovered by means of the art he had himself invented; and although by retiring to Brittany he seemed again for a time recruited, he died of consumption in the same year.

Laennec's work on mediate auscultation is undoubtedly the most important which the present century has produced in medical science. But it must be remembered that only a small portion of his high reputation is due to the discovery of the stethoscope, although from the tone of his work it is evident that he rested chiefly upon that as the basis of his future fame. He, with many of Corvisart's pupils, had long been in the habit not only of using percussion as a means of diagnosis, but of applying the ear directly to the chest: the stethoscope was merely a convenient auxiliary for the accomplishment of the same purpose which they had in view, but so little essential that many of the best physicians now employ it only when the direct application of the ear is personally inconvenient. Had the stethoscope been invented by any one of less genius and fitness for the study of diseases than Laennec, it would probably have fallen into the same neglect as the more original discovery of the value of percussion by Avenbrugger had till his work was translated and his practice imitated by Corvisart. The invention however of a convenient auxiliary was the fortunate means of leading Laennec to apply himself to the special study of the diseases of the chest; and he so far elucidated their pathology that those diseases, which at the beginning of this century were involved in the greatest obscurity, are now the most completely and clearly known of all which fall within the province of the physician, who now studies them with the ear with almost as great accuracy and confidence as the surgeon can investigate the diseases of which he takes charge, with the eye or the hand.

Laennec's other publications, though thrown into the shade by his great work, fully maintain his reputation. The chief of them are published in the 'Dictionnaire des Sciences Médicales,' in the articles 'Anatomie Pathologique,' 'Ascariides,' 'Cartilages Accidentels,' 'Dégénération,' 'Désorganisation,' 'Detrachyceros,' 'Encephaloïde,' 'Filaire.' A 'Life of Laennec' by Dr. Forbes is prefixed to his Translation of the 'Traité de l'Auscultation Médiate.'

LAER, PETER VAN DE. [BAMBOCCIO.]

LAFAYETTE, GILBERT-MOTTIER, MARQUIS DE, was born in September 1757, at Chevagnac, near Brioude, in the present department of the Haute-Loire; his father having been killed shortly before at the battle of Minden. He received a very imperfect education, which in after life he found little time or inclination to remedy. Left to follow his own inclinations he married at the age of sixteen Mademoiselle de Noailles d'Ayen, and his wife's relations offered him a place at court, which he refused. While a schoolboy he was an officer in the French army, but his military duties seem only to have required his attendance at reviews. When the American revolution broke out, Lafayette, who had adopted with enthusiasm the indefinite liberal notions then in vogue among the younger members of the French nobility, made an offer of his services to the American Commissioners then in Paris; and Silas Deane fancying that the adhesion of a wealthy young French noble and courtier would produce some éclat, gladly accepted them, engaging at the same time that Lafayette (then nineteen) should receive a major-general's commission in the American army. Accordingly he armed a vessel at his own expense and landed at Charlestown in April 1777. He fought as a volunteer at the battle of the Brandywine on the 11th of September 1777, in which he was wounded. He served in the north under Washington's orders, and in May 1778 being sent forward with a detachment to occupy Barren Hill, he only escaped from a superior British force by a hasty retreat. He was at the battle of Monmouth in the following June 1778, and afterwards received the thanks of Congress for his gallant conduct, and the present of a valuable sword. About this time his petulance and vanity were somewhat ludicrously manifested by his sending a challenge to Lord Carlisle, for some reflections on the conduct of France contained in a public letter from the English Commissioners to the President of the American Congress. In 1779 Lafayette returned to France, the government of that country having acknowledged the independence of the American States, and he obtained assistance in men and money, with which he returned to America. In 1780 he commanded the advanced guard of Washington's army; and he sat in the court-martial which condemned the unfortunate André. In 1781 Lafayette was intrusted with the defence

of Virginia against Lord Cornwallis, but his only military achievement while holding a separate command was that of escaping by a dexterous retreat from the English commander. Under Washington he subsequently contributed to the operations in consequence of which Lord Cornwallis was obliged to capitulate at York Town.

After the surrender of Cornwallis, Lafayette returned to France for fresh reinforcements, but the peace of 1783 prevented his sailing back to America. He however visited that country in 1784, and was received with the greatest enthusiasm in all parts of the United States. Washington maintained a friendly correspondence with Lafayette as long as he lived. After Lafayette's return to France he travelled through Germany, and was received with marked distinction by Frederick the Great and Joseph II. of Austria.

When the threatening state of affairs which preceded the outbreak of the French revolution compelled the king to summon the Assembly of Notables in 1787, Lafayette was returned a member, and he entered heartily into the proceedings of that body. He advocated the abolition of the lettres de cachet and of state-prisons, and he supported the claims of the Protestants of France, who were still labouring under civil disabilities. He also supported the convocation of the States-General, of which assembly he was returned a member. In this capacity he supported Mirabeau's motion for the removal of the military from the neighbourhood of the capital; and in July 1789, he proposed the first declaration of rights, which formed the basis of the following constitution. In the same month, being appointed commandant-general of Paris, he organised the national guard, and distributed among the soldiers a tricoloured cockade, namely, blue and red, the colours of the commune of Paris, and white, the colour of the lilies of France, and these became thenceforth the national colours. On the 15th of October of that year he marched at the head of the national guard to Versailles, where a tumultuous multitude had preceded him; and he escorted the king and the royal family back to Paris, whither the Assembly also removed their sittings. He voted in the Assembly for the institution of the jury for the suppression of hereditary nobility, for the political equality of all citizens, &c. Mistrusting the effects of individual ambition in revolutionary times, he moved and carried a resolution to the effect that the same person should not have the command of the national guards of more than one department at once. He himself refused the appointment of lieutenant-general of the kingdom. In conjunction with Bailly he instituted the club of the Feuillans, which supported the constitutional monarchy on a popular basis. After the king's forced return from the flight of Varennes, Lafayette supported the decree by which the king was restored to the exercise of his regal office on swearing to the new constitution. Upon this the republican party broke out into an insurrection, which Lafayette and the national guards put down on the Champ de Mars. Soon afterwards Lafayette gave in his resignation and retired into the country; but the war of the first coalition having begun, he was appointed to the command of the army of Flanders, and he defeated the allies at Philippeville and Mauberge. He was however hated by the Jacobins at Paris, and mistrusted by the court. On the 16th of June 1792, he wrote a strong letter to the Legislative Assembly, denouncing the plots of those men "who, under the mask of democratic zeal, smothered liberty under the excess of their licence." He soon after repaired to Paris, and demanded of the Legislative Assembly the punishment of the outrages committed against the king at the Tuileries on the 20th of June. But the republican party was already preponderating in that Assembly, and Lafayette found that he was not safe in Paris. It is said that he then proposed to the king and the royal family to take shelter in his camp at Compiègne, but the advice was rejected by Louis, or rather by those around him, who placed all their confidence in the Duke of Brunswick and the Prussians.

On the 30th of June the Jacobins of Paris burnt Lafayette in effigy in the Palais Royal. Lafayette having returned to his camp, publicly expressed to his officers his disapprobation of the attack on the Tuileries of the 10th of August, and on the 15th of that month he arrested the commissioners sent by the Legislative Assembly to watch him. Upon this he was outlawed, and was obliged to cross the frontiers with a few friends. His intention was to repair to some neutral country, but he was arrested by the Austrians, and carried to the fortress of Olmutz, in Moravia, where his wife and daughter soon after joined him, to console him in his confinement. He remained in prison for five years, and was released at last by the treaty of Campo-Formio; but not approving of the arbitrary conduct of the Directory he repaired to Hauburg, and did not return to France till after the 19th Brumaire, 1799. Here he found himself again in opposition to Bonaparte's ambition, and he voted against the consulship for life, refused all employment under that chief, and retired to the country, where he applied himself to agricultural pursuits.

In 1815 he was returned to the House of Representatives convoked by Napoleon I. on his return from Elba. After the defeat at Waterloo he spoke strongly against any attempt to establish a dictatorship, and moved that the house should declare its sittings permanent, and that any attempt to dissolve it should be considered as treason. When Lucien appealed to the Assembly not to forsake his brother in his adversity, Lafayette replied with great animation:—"We have followed your brother through the burning sands of Syria, as well as

to the frozen deserts of Russia; the bleached bones of two millions of Frenchmen scattered all over the globe attest our devotion to him; but that devotion," he added, "is now exhausted, as his cause is no longer the cause of the nation." On the return of the Bourbons, Lafayette retired to his country residence at Lagrange. In 1818 he was returned after a great struggle to the Chamber of Deputies for the department of La Sarthe. During that and the following session he spoke in favour of constitutional liberty and against exceptional laws, but to no effect. In 1824 he again went on a visit to the United States, where he was received with the greatest enthusiasm in every state of the Union. In 1830, being in the house of deputies, he was foremost among the members who resisted the arbitrary ordinances of Charles X. He then called out again the national guards and placed himself at their head. He was one of the first to propose Louis Philippe as king of the French, stating his conviction that a monarchy based on popular institutions was the government best suited to France; and his influence with the national guard did much to compel the submission of the republican party. During the trials of the ex-ministers he further exerted himself zealously to save them from popular fury. But he soon lost the friendship of the king, who was jealous of Lafayette's popularity and influence, which Lafayette himself was too fond of displaying. A measure was almost immediately afterwards brought forward by the ministry for suppressing the office of commander-in-chief of the national guard. Lafayette anticipated its effect by at once tendering his resignation; but from this time all appearance even of cordiality between him and the king was at an end. Of the subsequent differences between them concerning views of foreign and domestic policy several versions have been given. La Fayette died at Paris on the 20th of May 1834, and his funeral took place on the 28th of the same month, being attended by numerous friends, foreigners as well as French, peers and deputies, who showed the high sense which they entertained of the personal character of the deceased. He was interred, according to his own directions, in the same grave with his wife. Lafayette was in no sense a great man, but he was always actuated by worthy motives, and he was one of the few public men whose character passed unscathed through the ordeal of half a century of revolutions.

LAFAYETTE, MARIE-MAGDELAINE DE LA VERGNE, COUNTESS DE, a celebrated French writer of the 17th century, was the daughter of an officer and a nobleman of Provence. She took lessons in Latin of Ménage and Father Rapin, and soon made great progress in that language. In 1655 she married Francis count de Lafayette, and her house became the rendezvous of the literary men and the wits of the age. Lafontaine, Ménage, Huet, and Segrain were her most frequent visitors. The Duke de La Rochefoucault, celebrated for his wit and his licentiousness, became acquainted with her, and she boasted afterwards of having contributed to his reformation. Madame de Sevigné, in her letters, speaks highly of the moral character of Madame de Lafayette as well as of her talents. She wrote several novels which obtained a high reputation at the time, being the first of the kind in France written in a natural style, and free from the exaggerations and affectation of former novelists. She also wrote 'Mémoires de la Cour de France, pour les années 1681-89,' which contain some curious particulars; 'Divers Portraits de quelques Personnes de la Cour,' being true sketches of living characters; and 'Mémoires de Henriette d'Angleterre,' which are not so interesting as the other two. Madame de Lafayette left also other memoirs of contemporary history which have not been published. Her printed works were collected and published together in 8 vols. 12mo, Paris, 1786, with a notice of her life, and again in 1804, together with the works of Madame de Tencin. Her correspondence was published in 1805. Madame de La Fayette died in 1693.

LAFFITTE, JACQUES, the leading banker of France during the empire and the restoration, was born on the 24th of October 1767 at Bayonne, where his father was an honest but indigent carpenter. In 1787, unfriended, with no references, having nothing to speak for him but an open countenance, a frank disposition, and that lively humour which is the birthright of the south, he walked up to Paris. Almost immediately he obtained a situation as supernumerary clerk in the banking-house of Perregaux, with a salary of 1200 francs, or 48*l*. Here he became bookkeeper in 1789; cashier in 1792; chief clerk and manager of the firm in 1800; junior partner in 1804; and in 1809 he succeeded to the business, thenceforward carried on in his name. Meanwhile nine brothers and sisters had been called up to the capital, where by his means they were all comfortably provided for. In 1809 Laffitte was created Regent of the Bank of France, and President of the Chamber of Commerce in Paris. In 1814 he succeeded Comte Jaubert as Governor of the Bank of France, but declined receiving any salary for his services. His annual reports of the operations of the bank were much admired for their clearness, brevity, and precision, as well as for the practical suggestions they contained.

After the second capitulation in July 1815, the public funds having been so much reduced by the late wars that the French army behind the Loire could not be paid, the government was placed in a critical position, and disturbances were apprehended in the capital, when Laffitte delivered to the finance minister, Mallien, the sum of 2,000,000 francs drawn from his own coffers; and his able management of the national resources did much to maintain public confidence during the crisis. In October 1816 Jacques Laffitte was elected a member of the

Chambre des Députés for the Electoral College of the department of the Seine, and re-elected for the same constituency in 1817. On the 16th of December of the latter year he delivered an impressive speech in defence of the liberty of the press, a principle which he steadily advocated through life. A moderate republican himself, his character was respected by men of every party. In 1815 Louis XVIII., departing for Ghent, deposited a considerable sum in Laffitte's bank, which the emperor left untouched. Nearly four months later, Napoleon I., quitting Paris for the last time, sent a sum of 5,000,000 francs to the same dépôt; and when Laffitte waited on him with a receipt, Napoleon said, "It is unnecessary; I know you, M. Laffitte; you never liked my government, but you are an honest man." This large deposit was likewise respected by the Bourbons.

In 1830 the private fortune of M. Laffitte had risen to upwards of 2,000,000*l*. sterling. This great accumulation had been acquired by sheer industry and integrity, without it is affirmed any private speculation, in the midst of revolution, war, and public disturbances of every kind. In that year came the revolution of July. At first Laffitte strove to arrest the movement. In company with Casimir Perrier, Gérard, Lobau, and Manguin, he went through the barricades to the head-quarters of Marshal Marmont, expostulated with that officer, and entreated him to use his influence with Charles X. to induce him to withdraw the ordinances which had caused the insurrection. This proposal having been rejected, Laffitte took a decisive course, and joining the insurgent party, opened his hotel to their leaders, issued proclamations, organised the movement, and sustained the popular cause with his own funds. It was he, and not M. Thiers, who proposed the Duke of Orleans as chief magistrate—a fact which has been preserved in his despatch to that prince on the 29th of July 1830:—"Do not hesitate, but make your choice between a crown and a passport."

On the 3rd of November 1830 Laffitte became prime minister (président du conseil), and also minister of finance; but he resigned office in March 1831. Soon after occurred the great monetary panic, which, being felt all over Europe, threw down so many continental houses; whilst Laffitte, who was the creditor of many of the largest, was involved in the same ruin with those he had trusted. In this extremity, desirous of meeting if possible every claim, he sold off all his private property, still amounting to 50,000,000 francs. This surrender being then deemed inadequate to liquidate his debts, Laffitte put up for sale his hotel, in which the new monarchy had been formed; but to permit this it was felt would be a national discredit: a subscription of 1,500,000 francs was raised, and his hotel preserved for his family. Subsequently, when the exact state of his assets became known, he was found to have a surplus of 8,000,000 francs, after the full discharge of his liabilities. He died at Paris, May 26th 1844, and was buried at the cemetery of Père-la-Chaise on the 30th. His obsequies were attended by the élite of the capital: Arago and Dupin delivered orations over his grave.

LA FONTAINE. [FONTAINE, LA.]

LAGNY, THOMAS FANTET DE, a French mathematician, was born at Lyon in 1660, and died at Paris 12th of April 1734. At an early period his scientific attainments led to his being appointed hydrographer royal at Rochefort. Subsequently he became sub-director of the general bank of Paris, and lost the principal part of his fortune by the failure of that establishment. His mathematical labours appear to have been in a great measure directed to objects of mere curiosity; as an instance of which he occupied himself with the quadrature of the circle, and computed the ratio of the circumference to the diameter, as far as 120 decimal places, a degree of approximation which could never be of any practical utility. He however has called forth the eulogium of Fontenelle, who, speaking of his treatise on the 'Cubature of the Sphere,' says, "it is a choice and singular production which only a great mathematician could have written." His methods of facilitating the solution of indeterminate problems are ingenious, and the theorems which he added to the arithmetic of sines are important. He was elected member of the Royal Academy of Paris in 1696; associate-geometrician in 1699; veteran pensioner in 1723; and fellow of the Royal Society of London in 1718. The following is a list of his published works: 'New Method of Extracting and Approximating to the Roots of Quadratic and Cubic Equations,' Paris, 1691, of which an enlarged edition was published in the following year; 'Elements of Arithmetic and Algebra,' Paris, 1697; 'Cubature of the Sphere,' La Rochelle, 1702; 'Binary System of Arithmetic,' Rochefort, 1703; 'Analysis of the New Methods of Resolving Problems,' Paris, 1733; besides numerous memoirs in the Transactions of the Royal Academy.

LAGRANGE, JOSEPH-LOUIS DE, was born at Turin, 25th January 1736. His parents were Joseph-Louis Lagrange and Marie-Thérèse Grass, the daughter of a physician at Cambiano. His father held the office of treasurer of war at Turin, and had once been in affluent circumstances, but had ruined himself by injudiciously entering into hazardous speculations. To this circumstance, which was then regarded as a misfortune, Lagrange himself has frequently attributed a considerable share of his subsequent fame and happiness. "Had I been rich," he has been heard to say, "I should probably not have become a mathematician."

In the early part of his studies he manifested no particular love either for the pure mathematics or the physical sciences. His chief

delight consisted in the perusal of the various Latin authors, and more especially the works of Cicero and Virgil. These however in his second year were superseded by the synthetical writings of the ancient geometers, and these in their turn gave place to the more powerful analysis of modern times. The perusal of a memoir by Dr. Halley ('Phil. Trans.,' 1693) 'On the superiority of modern algebra in determining the foci of object-glasses,' is said by his biographers to have convinced him of the utter inadequacy of geometrical methods as instruments of investigation, and it is not improbable that this might have been the occasion of his selecting the path which he thenceforth pursued with so much honour to himself and so great advantage to science.

Before he attained the age of nineteen he was appointed to the professorship of mathematics at the military college of Turin, where by far the greater part of his pupils were older than himself. The year following (1755) he addressed a letter to Euler relative to the isoperimetric problems, and that of the curve of quickest descent, which had engrossed so much of the attention of the principal mathematicians of the day, and of Euler in particular; but, owing to the want of general methods, their labours had proved but partially successful. Each problem had been resolved by methods peculiar to itself, and the solutions rested upon artifices unsatisfactorily indirect. In this letter Lagrange communicates the germs of his calculus of variations, to which his recent analytical researches had led, and shows with what advantage and facility it may be applied to the problems in question. Euler, in his reply, expresses his entire concurrence in the correctness of its principles, and hails the discovery as the harbinger of others of yet greater importance; he acknowledges how much the application of these principles had promoted the success of his own recent investigations, which however he refrained from publishing until the remainder of the researches of Lagrange were made known, lest he should thereby deprive him of any portion of the glory which was so justly his due, and concludes by announcing the nomination of Lagrange as a member of the Academy of Berlin.

In 1758 he took an active part in the foundation of the Royal Academy of Turin, in which he was unanimously chosen the director of the physico-mathematical sciences. The following year appeared the first volume of the Transactions of that Society, consisting principally of the researches of Lagrange on the propagation of sound, and on the integration of differential equations, and those of finite differences. He here also proves, on the subject of vibrating chords, that the time of oscillation is independent of the figure of the chord, an empirical truth, the demonstration of which D'Alembert believed to be impossible (see the preface to D'Alembert's 'Opusculs Mathématiques,' Paris, 4to, 1761, tome i.) [D'ALEMBERT.] Lagrange and D'Alembert were rivals, but not opponents. Their cause was a common one, which each laboured to promote with indefatigable zeal. The manner in which their controversies were conducted shows that they were prepared to sacrifice every personal feeling to their love of truth and the advantage of science. When either attempts the refutation of his rival's theory, it is frequently by means of the beautiful theorems to which the researches of the other has already led. On the other hand, a discovery of importance, by whichever party it may happen to be made, is immediately followed by the congratulations of him from whom congratulation is due. Thus D'Alembert, in one of his letters to Lagrange, says, "Your problem appeared to me so beautiful, that I have investigated a solution upon different principles;" and upon another occasion, when the Academy had proposed the 'Theory of the Libration of the Moon' as the subject of one of its prizes, and the medal had been awarded (1764) to the memoir of Lagrange, we find D'Alembert writing to him solely to express the pleasure and advantage which he had derived from its perusal, and his acquiescence in the justice of the award.

The calculus of variations, upon the discovery of which the fame of Lagrange may be permitted to rest, is eminently important in many branches of the mathematics, as in the determination of the maxima and minima values of indefinite integral formulæ, &c.; but its utility is most conspicuous in the higher branches of physical astronomy. The space allotted to this article admits of our giving but one illustration of its importance in this respect. Euler, in his 'Treatise of Isoperimeters,' printed at Lausanne in 1744, had shown, that in the case of trajectories described about a central force, the product of the integral of the velocity and the element of the curve was either a maximum or minimum; but when he attempted to extend this principle to a system of bodies acting upon one another, he found that the highest analysis of which he could avail himself was insufficient to overcome the difficulties of the problem. This failure on the part of Euler excited the emulation of Lagrange, whose chief objects appear generally to have been the extension and generalisation of existing theories. By a beautiful application of his method of variations to a principle of dynamics discovered by Huyghens, and known by the name of the Conservation of vis viva, he was led to the following general theorem: "In every system of bodies acted upon by forces proportional to any function of the distance, the curves described by the bodies are necessarily such that the sum of the products of the mass, the integral of the velocity and the element of the curve, is always either a maximum or minimum." This theorem, the proof of which offered so much difficulty to Euler, has been denominated

the principle of 'least action,' and is frequently regarded as one of the four great principles of dynamics, although Lagrange has shown that it is merely a corollary to a still more general formula given by him in the second section of the second part of his 'Mécanique Analytique.'

When the Academy of Berlin was threatened with the departure of Euler for St. Petersburg, Frederick renewed his importunities to D'Alembert to succeed him. [D'ALEMBERT.] D'Alembert however from various motives, being unwilling to quit his native country, suggested that the proffered honour might be conferred upon Lagrange. Lagrange was accordingly appointed professor of physical and mathematical sciences to the Academy, and continued for more than twenty years to enrich the memoirs of that society with his researches connected with physical astronomy and other subjects of importance. The insignificant stipend (1500 crowns) which was allotted to him, when contrasted with the munificent offers made to D'Alembert, cannot fail to strike every reader with surprise. Lagrange quitted Berlin after the death of Frederick, not being satisfied with the treatment he then received. He had previously been invited by the ministers of Louis XVI. to settle in Paris.

In 1772 M. Lagrange was elected foreign associate of the Royal Academy of Paris, and in 1787, on his arrival at the French capital, he received the honorary title of veteran pensioner. Apartments were allotted to him in the Louvre, and here, surrounded by the principal mathematicians of the day, he continued to live happily up to the time of the revolution. After this he began to be subject to fits of melancholy, which so far increased upon him that he has been heard to say that his enthusiasm for the sciences was extinguished, and that his love of physical research had disappeared. He was successively appointed professor of mathematics to the normal and polytechnic schools, member of the Institute, of the board of longitude, grand officer of the legion of honour, and count of the empire. He died at Paris, the 10th of April 1813, in his seventy-eighth year. His remains were deposited in the Pantheon, and his funeral oration was spoken by his illustrious friends Laplace and Lacépède.

"Among those who have most effectually extended the limits of our knowledge," said Laplace, in his funeral oration, "Newton and Lagrange appear to have possessed in the highest degree the happy art of detecting general principles, which constitutes the true genius of science. This art, joined to a rare elegance in the exposition of the most abstract theories, characterised Lagrange." His work on Mechanics, resting upon the method of variations of which he was the inventor, flows wholly from a single formula, and from a principle known before his time, but of which no one but himself was able to appreciate the importance. "Among the successors of Galileo and Newton," says Professor Hamilton, speaking of the theoretical development of the laws of motion, "Lagrange has perhaps done more than any other analyst to give extent and harmony to such deductive researches, by showing that the most varied consequences respecting the motions of systems of bodies may be derived from one radical formula; the beauty of the method so suiting the dignity of the results as to make of his great work a kind of scientific poem."

We conclude this imperfect sketch of the life and writings of Lagrange with a list of his published works, which we believe to be complete:—

Letter dated 23rd June, 1754, addressed to Jules Charles Fagnano, containing a series for the differentials and integrals of any order whatever, and corresponding to the 'Binomial Theorem' of Newton, Turin, 1754; 'Analytical Mechanics,' 1st edit. 1788, 2nd edit. 1811-15 (the second volume of the last edition is edited by Messrs. De Prony, Garnier, and Binet). 'Theory of Analytical Functions,' 1st edit. 1797, 2nd edit. 1813; 'Resolution of Numerical Equations,' 1st edit. 1798, 2nd edit. 1808, 3rd edit. (edited by Poisson) 1826; 'Lessons on the Calculus of Functions,' 1st edit. 1801, 2nd edit. 1804, 3rd edit. 1806 (printed in the 'Journal of the Polytechnic School,' tome 5).

Memoirs in the Transactions of the Academy of Turin.—1759, tome 1, Method of Maxima and Minima; Integration of Differential Equations and Equations of Finite Differences; On the Propagation of Sound. 1762, tome 2, Supplement to the Researches on the Propagation of Sound, contained in vol. 1; A new method of determining the Maxima and Minima of Indefinite Integral Formulæ; application of that method to Dynamics; New Researches on the Propagation of Sound. 1765, tome 3, Application of the Integral Calculus to Dynamics, Hydrodynamics, and Physical Astronomy; tome 4, Integration of Differential Equations; Method of Variations; On the Motion of a Body acted upon by two Central Forces; tome 5, On the Percussion of Fluids; New Theory of the Integral Calculus.

Memoirs in the Transactions of the Academy of Berlin.—1765, tome 21, On Tautochronous Curves. 1766, tome 22, On the Transit of Venus, June 3, 1769. 1767, tome 23, On the Solution of Indeterminate Problems of the second degree, and on Numerical Equations. 1768, tome 24, Additions to the Memoir on the Resolution of Numerical Equations; New Method of Resolving Indeterminate Equations; New Method of Resolving Algebraic Equations by means of Series. 1769, tome 25, On the Force of Springs; On the Problem of Kepler; and On Elimination.

Memoirs in the Transactions of the Berlin Academy (new series).—1770, On Tautochronous Curves; Algebraic Equations, and Arithmetic. 1771, On Prime Numbers and Algebraic Equations. 1772, On Differen-

tiation and Integration; on Imaginary Roots; Astronomical Refraction; Integration of Equations of Partial Differences. 1773, On the Rotatory Motion of a Body; on the Attraction of Elliptic Spheroids; on Triangular Pyramids and Arithmetic. 1774, On the Particular Integrals of Differential Equations; On the Motion of the Nodes of the Planets' Orbits. 1775, On Finite Differences; the Attraction of Elliptic Spheroids, and Arithmetic. 1776, On the Change in the Mean Motions of the Planets; Continued Fractions, and Spherical Astronomy. 1777, Diophantine Analysis; On Escapements; Determination of the Imaginary Roots of Algebraic Equations; On the Motion of a System of Bodies which mutually attract each other inversely as the square of the distance. 1778, Determination of the Orbits of Comets from three observations; Theory of Telescopes. 1779, On Particular Integrals; Construction of Geographical Maps. 1780, Libration of the Moon, and on other Problems depending upon the Non-Sphericity of that Planet. 1781, Theory of the Motion of Fluids; Principles and general Formulæ for determining the secular variations of the Planets' Orbits; Report of M. Lagrange on a Method proposed for finding the Quadrature of the Circle. 1782, Continuation of the preceding Memoir on Secular Variations; Report of Lagrange on a Method proposed for determining whether the Earth is flattened at the poles. 1783, On the Periodical Variations in the Planetary Motions; Secular Variations in the Mean Motions of the Planets; Corrections of the common Methods of Approximation for Integrating the Equations of the Planets' Motions; A particular Method of Approximation and Interpolation; A New Property of the Centre of Gravity; Third Memoir on the determination of the Orbits of Comets. 1784, Theory of the Periodical Variations in the Planets' Motions, independent of the Inclinations and Eccentricities, for each of the six principal planets. 1785, Partial Differential Equations. 1786, Geometrical Theory of the Motion of the Aphelia, to serve as an addition to Newton's Principia; Correction of those parts of Newton's Principia relative to the Propagation of Sound and the Motion of Waves. 1792-93, Solution of a Problem in Life Annuities; Determination of the general term of a recurring series whose Generating Equation contains equal roots; On Elliptic Spheroids; On Interpolation; On the Secular Equation of the Moon; Addition to a Memoir by M. Duvalle-Roi on the Secular and Periodical Variations of Herschel, printed in the Memoirs of the year 1787. 1803, On a General Law of Optics.

Memoirs in the Transactions of the Academy of Paris.—1764, On the Libration of the Moon (this is the memoir for which the medal was awarded to M. Lagrange by the Academy, and in which he first employs the principle of Virtual Velocities). 1766, On the Inequalities of Jupiter's Satellites. 1772, On the Formation of Tables of the Planets; On the Problem of Three Bodies. 1774, On the Motion of the Nodes and the Inclinations of the Orbits of Planets.

Savans Etrangers.—Tome 7, On the Secular Equation of the Moon. (Prize Memoir for the year 1774); tome 10, On the Perturbations of a Comet which passes near to a Planet.

French Institute. Memoirs of the First Class.—1808-9, On the Variation of the Elements of a Planet, and more particularly the Variation of the Major Axis of their Orbits; Theory of the Variation of Arbitrary Constants in all Mechanical Problems (two memoirs).

Journal of the Polytechnic School.—Tome 2, On the principle of Virtual Velocities; Essay on the Transformation of Fractions; Theory of Analytical Functions; Analysis of Spherical Triangles; tome 5, On the Calculus of Analytical Functions; tome 7, Supplement to the same; tome 8, On the Attraction of Spheroids.

Connaissances des Temps.—1814, On the Origin of Comets. 1817, On the Calculation of Eclipses. 1819, Remarks on the Method of Projection in the Calculation of Eclipses. 1821, Method of determining the Orbit of a Comet from Observation.

M. Carnot, while Minister of the Interior, recommended to his government the purchasing of the manuscripts of Lagrange, and, at his suggestion, the mathematical and physical class of the Institute nominated a commission to select such as were in a state for publication; the rest are arranged and deposited in the library of the Institute.

Delambre; Mémoires de l'Institut*, 1812; Lagrange, *Mécanique Analytique*, 1815; *Théorie des Fonctions Analytiques*, 1813; *Miscellanea Taurinensia*, 1759-61; *Opusculs Mathématiques de M. d'Alembert*, 1761-69; *Notice of the Life of Lagrange*, by Maurice; *Biog. Universelle*; Professor Hamilton, *Memoir on a General Method in Dynamics*, in *Phil. Trans.*, 1834; *Dictionnaire Bibliographique*, de Quérard, 1829, &c.)

LA HARPE. [HARPE, LA.]

LAHIRE, PHILIPPE DE, was born at Paris March 18th, 1640, in which city he also died April 21st, 1719. Up to the age of twenty-four years he followed the profession of his father, who had acquired considerable reputation as a professor of painting and sculpture to the Royal Academy. In 1660 he visited Italy, partly for the improvement of his health, and partly with a view to the completion of his professional education. While at Venice he applied himself to the study of geometry, and more particularly to the conic sections of Apollonius; and a few years after his return to Paris he published several treatises upon those subjects, which fully established his claim to the reputation of a profound geometrician. In 1679, Colbert having suggested the construction of a general map of France, Picard and De Lahire were nominated by the king to conduct certain surveys along

the coast of Gascony, and in 1683, De Lahire, in conjunction with Dominic Cassini, was instructed to proceed with the measurement of the meridian, which had been commenced in 1669 by Picard. [PICARD.] The death of M. Colbert having put a stop to this important undertaking, he was next employed in determining the difference of level of the river Eure and the reservoir of Versailles, preparatory to the construction of an aqueduct for the supply of the capital, which he effected to the satisfaction of the king, and of Louvois, the then minister. The other public works in which M. De Lahire was successively engaged were numerous and important, but our limits will not permit us to notice them more particularly. He was twice married, and "each of his marriages," says M. Fontenelle, "furnished an Academician."

Although he does not appear to have been altogether unacquainted with the infinitesimal calculus, the whole of the subjects upon which he has written are treated synthetically. In his manners he was more reserved than the generality of his countrymen, but the uprightness and disinterestedness of his conduct were most exemplary. A pure piety, free from superstition and singularity, characterised the whole of his life.

For further information the reader may advantageously consult the 'Mémoires de Nicéron,' tom. v. and x.; 'l'Histoire du Collège Royal,' by Gouget; and the 'Eloge de Lahire,' by Fontenelle ('Œuvres Diverses,' folio, 1729), from which this notice is chiefly drawn. His published works are—'Treatise on Conical and Cylindrical Sections,' Paris, 1673, 4to; 'De Cycloide Opusculum,' 1676; 'Conic Sections and Geometrical Loci,' 1679; 'Gnomonics, or the Art of making Sundials,' 1682; 'Conic Sections,' 1685, folio; 'Tabulæ Astronomicæ,' 1702, 4to; 'Treatise on Surveying,' 1689; 'Mechanics,' 1675; 'Description of the Globes in the Pavilion of the Château de Marly,' 1704; besides numerous memoirs in the public journals of the day, and more particularly in the 'Transactions of the Academy of Sciences,' from 1666 to 1718.

LAING, MALCOLM, an historian, was born in Orkney, where he possessed a small paternal estate, in 1762. He received the rudiments of education at Kirkwall, and afterwards studied at Edinburgh, where he was one of the most active members of the 'Speculative Society,' an association in which many young men who became distinguished in after life first tried their prowess. In 1785 he joined the Scottish bar. He does not appear to have obtained much practice as a lawyer, and the only conspicuous occasion in which he was professionally employed seems to have been in the defence of some of the parties tried for sedition in Scotland between 1793 and 1795. He is one of the many instances where lawyers have in their works displayed peculiarly high forensic abilities, without being able to rise in their profession. His first known literary effort was editing the last volume of Henry's 'History of Britain,' in 1793, after the author's death. He was charged with having spoiled the harmony of the work, as Henry's opinions were all in favour of despotic principles, while the additions made by Laing were of a democratic tendency. In 1800 he published 'The History of Scotland from the Union of the Crowns on the accession of James VI. to the throne of England, to the Union of the Kingdoms in the reign of Queen Anne.' This was published along with two other works, the names of which appearing on the title of the 'History,' with which the subjects of neither of them were in any way connected, are very characteristic of Laing's propensity to enter on disputed points in history or criticism with the spirit of a lawyer. The 'History' as published in two volumes was accompanied by 'Two Dissertations, Historical and Critical, on the Gowry Conspiracy, and on the supposed authenticity of Ossian's Poems.' To the second edition of his 'History,' published in 1804, he added 'A Preliminary Dissertation on the Participation of Mary Queen of Scots in the Murder of Darnley.' He was a sagacious, honest, and able historical critic, but too much inclined to take up a side in any question, and to keep perpetually in view the circumstance that he was bound to defend that side. His style was harsh and formal, and sometimes obscure. He was for some time member of parliament for Orkney, and enjoyed the confidence and esteem of Fox. He died in 1818. His brother Samuel Laing, the author of the valuable 'Notes of a Traveller,' 'Travels in Norway,' &c., succeeded to his property. Mr. Samuel Laing, late chairman of the Brighton Railway and Crystal Palace Companies, and a conspicuous member of the railway interest in the House of Commons, is the son of Mr. Laing the traveller, and nephew of the historian.

LAIRESSE, GERARD, an eminent painter, was born at Liège in 1640. He acquired his knowledge of the art from his father; but there is reason to believe that he also studied under Bartolet, from whom he probably derived the taste for the antique which appears in his works. He first followed his profession at Utrecht, where he met with little encouragement; but having been advised to send one of his pictures to the famous picture-dealer Vlyenburg, at Amsterdam, he was so pleased with it that he prevailed on Lairese to remove to Amsterdam, which proved the means of raising him from poverty and obscurity to fortune and reputation. Having a lively imagination, great rapidity of execution, and great industry, the number of paintings which he executed was very great. They are of very unequal degrees of merit, but all bear marks of considerable ability. His expression is generally good, his colouring true and glowing, and

his touch light and firm; his draperies too are well cast, broad, simple, and in natural folds. When he introduces architecture into his backgrounds it seems to have been designed after Greek or Roman models. He also acquired considerable reputation by his etchings. He had the misfortune to become blind several years before his death, but in this state he was surrounded by artists and lovers of painting, to whom he was fond of communicating instruction. The celebrated treatise on the art of painting which goes by his name was not actually written by him, but compiled from his observations during his blindness, and published by a society of artists after his death, which happened in the year 1711, in the seventy-first year of his age.

LAKE, GERARD, FIRST VISCOUNT LAKE, the second son of an ancient family, was born on the 27th of July 1744. Having entered the army at the early age of fourteen, he made his first campaigns in the Seven Years' War. He served afterwards in the American War, in Holland with the Duke of York in 1793, and having attained with credit to the rank of general, was appointed to the chief command in Ireland during the rebellion of 1797-98.

In 1800 he was sent as commander-in-chief to India, during the Marquis of Wellesley's government. On the breaking out of war with Scindiah in 1803, General Wellesley being charged with the conduct of affairs in the Deccan, Lake himself took the field in the north of Hindustan. On the 28th of August he crossed the north-western frontier of Oude into the Mogul territory, and after taking by storm the strong fort of Alighur, arrived within six miles of Delhi on the 11th of September. The Mahrattas, in superior force, offered battle in defence of the city, and Lake led his troops at once to the attack. The enemy's position was strong, and a repulse seemed likely to ensue, when Lake, by a well-conducted feint of retreat, lured the Mahrattas from their entrenchments, and then resuming the offensive won the day by a brilliant and decisive charge. He entered Delhi the next day, and the Mogul emperor, Shah Allum, the nominal sovereign of India, old and blind, who had been but a puppet in the hands of the Mahrattas, gladly passed into the more decent and secure guardianship of the British government. Lake next marched upon Agra, which was taken after a stout resistance. A fresh descent of the Mahrattas recalled him towards Delhi; and on the 1st of November he won another well-fought but decisive battle near the village of Laswaree. By this series of successes the whole of Scindiah's possessions north of the Chambul River fell into his hands, and in reward General Lake was raised to the peerage (September 1st, 1804), by the title of Baron Lake of Delhi and Laswaree, and Aston-Clinton in Bucks.

In 1804-5 Lord Lake again took the field in the same part of India against Holkar. In these campaigns he was less uniformly and brilliantly successful: still he had reduced Holkar's power to a low state when the arrival of the Marquis Cornwallis as governor-general substituted a peaceful policy for that system of conquest which Lord Wellesley had so energetically pursued. Lord Lake returned to England in September 1807, and was immediately created a viscount (October 31st). He died on the 26th of February 1808.

LALANDE, JOSEPH-JEROME LE FRANÇAIS DE, was born at Bourg, in the department of Ain, on the 11th of July 1732. His parents were Pierre le Français and Marie Monchinot, of whom he was the only son. By their inordinate indulgence and extreme solicitude in anticipating all his wishes, he soon contracted habits of impatience and an irritability of temper, which in after years he frequently found himself unable to control. Surrounded by Jesuits, and nurtured by his mother in the strict observance of devotional ceremonies, we are told that at the age of ten years it was not unusual for him, being disguised as a priest, to deliver a sermon of his own composition, to a select society, who requested as a favour to be present at the declamations of so precocious an orator. As his reason however began to be developed, he gradually detached himself from those occupations, notwithstanding the applause which his auditors were ever ready to bestow, and he as eager to receive; for while yet a child he evinced an unusual love of adulation. Many anecdotes are told in proof of the early acuteness of his perception and the strong desire which he manifested to comprehend the relation which one event bore to another.

When about thirteen or fourteen years old he was sent to a college at Lyon, where for a time he appears to have derived equal pleasure from the study of poetry and eloquence, and from attending the lectures of the several professors on natural and metaphysical philosophy. Upon the occurrence of the great eclipse of 1748, of which, with the assistance of his tutor, Le Père Béraud, he made a telescopic observation, he took great interest in the explanation given to him of that phenomenon, and thence-forward showed a more decided partiality for the mathematical sciences. But it was the perusal of Fontenelle's 'Entretiens sur la Pluralité des Mondes,' which, more than any other circumstance, influenced his choice of a profession by familiarising him with the sublime speculations of astronomers, and nourishing that love of distinction which characterised the whole of his career. "It is with pleasure," says Lalande himself, in his preface to an edition of that amusing book, which he afterwards edited, "that I acknowledge my obligation to it for that devouring activity which its perusal first excited at the age of sixteen, and which I have since retained; from that time there appeared to me nothing comparable to the Academy of Sciences, and I desired ardently to see it long before

I imagined there was a possibility of my ever becoming one of its members." In order that he might devote himself more exclusively to the pursuit of the mathematics, he requested permission of his parents to become a Jesuit; but they now entertained views of a more ambitious and worldly nature, and, instead of yielding to his request, held out the prospect of obtaining for him a lucrative appointment in the law, if he would consent to adopt that profession.

Under the pretext of acceding to their wishes he removed to Paris, where he commenced the study of jurisprudence; but his first visit to the observatory decided his vocation, for he immediately determined upon attending the course of astronomy at the College of France. Delille, who had recently returned from Russia, was then professor of astronomy to that institution; but he was old, and his long absence had occasioned him to be almost forgotten by the public, so that his lectures were very thinly attended. This latter circumstance enabled him to proportion his lessons to the progress of Lalande, whose rapid advances gave him the greatest satisfaction. They soon became mutually attached to each other, and Lalande was in the habit of frequenting the house of his tutor, where his mathematical difficulties could be more readily removed, and where he could gain experience in astronomical observation. About the same time he likewise attended the lectures of Lemonnier, whose reputation as an astronomer was perhaps greater than that of Delille; and as both were fully competent to appreciate the ability of Lalande, there arose between these professors a sort of emulation as to which should contribute most to his future eminence. But notwithstanding the ardour with which Lalande applied himself to his favourite science, the study of the law was not altogether neglected. At the age of eighteen he received from the judicial authorities of Paris the title of Advocate, soon after which he received instructions from his parents to return to Bourg, where they were anxious that he should practise his profession for some years. A fortuitous circumstance induced them to abandon the plans which they had formed for the promotion of his welfare and happiness.

Lacaille, who was at that time about to take his departure for the Cape of Good Hope, with a view to the more exact determination of the moon's parallax, had called upon the astronomers of Europe to forward the object of his voyage by making observations at their respective observatories, similar to those which he contemplated making himself at the Cape. The favourable position of Berlin, which has nearly the same longitude, while it differs in latitude by nearly the fourth part of the earth's entire circumference, suggested to Lemonnier the peculiar advantages which would accrue from observations made at the observatory of that city. But it so happened that there were no instruments of any value at that observatory, and no person of ability had been appointed to its superintendance. Lemonnier instantly offered the use of his own instruments, and at his recommendation the academy confided to Lalande the responsibility of making the necessary observations. When Maupertuis presented Lalande to Frederick, the latter, as might be expected, expressed his surprise at receiving so young an astronomer—for Lalande had not then completed his nineteenth year,—but after many flattering expressions he gave orders that everything should be done which could tend to the attainment of the object in view. Here, during the latter part of the year 1751, and the early part of 1752, Lalande passed most of his nights in the observatory; his mornings, in studying the mathematics under Euler; and his evenings, in the society of Maupertuis, Voltaire, D'Argens, and La Matris. After completing his observations, the substance of which he communicated in a memoir to the Academy of Berlin, he returned to Paris, where the Royal Academy expressed their unqualified approbation of his conduct, and immediately elected him a member of their society. From his election till within a few years of his death, he contributed regularly to the Transactions of the Academy, and from this time his popularity as an astronomer may be dated.

The expected return of Halley's comet had led Clairaut to investigate the amount of the perturbations to which it would be subject. Lalande, with the assistance of Madame Lepaute, supplied him with all the numerical computations of which he had need; and when the appearance of the comet had realised his predictions, he wrote its history, which appeared in 1759, appended to a translation of Halley's planetary tables. In 1760 he was appointed editor of the 'Connaissances des Temps,' in which he introduced many important alterations, and gave to it the form which it has since retained. In 1762 he succeeded Delille as professor of astronomy to the College of France, and continued to discharge the duties of his office with zeal and assiduity for more than forty years. From among his pupils he was in the habit of selecting those who manifested peculiar attachment to astronomical science, and these he would invite to his house, where he perfected them in the calculations necessary for applying their theoretical knowledge to objects of utility. His residence was in fact a school wherein many of his pupils not only received a scientific education, but likewise board, lodging, and other necessities, and from whence they afterwards removed either to conduct some observatory, to fill an astronomical lectureship, or as professors of navigation and nautical astronomy on board the vessels of the government.

In 1764 he published his large treatise on astronomy, which he afterwards extended to four volumes 4to. Before the appearance of this work there existed several able treatises on the theory of astronomy by Lacaille, Cassini, and Lemonnier; but these contained little or no information as to the practice of astronomy. To supply this omission was the main object of Lalande. The work contains many biographical and historical notes, which will always be interesting, and the results of numerous observations to which it will always be useful to recur.

In 1772 he published his 'Account of the Transit of Venus,' observed on the 3rd of June 1769, which was drawn up with considerable labour from the communications of those persons who, at his recommendation, had been sent by several of the European governments to different parts of the globe, in order to observe the phenomenon.

Lalande died at Paris, 4th of April 1807, in his seventy-fifth year. As an observer, an author, and a tutor, he undoubtedly did much for the promotion of astronomy; but looking to the state of the mathematics at the time in which he lived, his knowledge of them appears to have been very limited. The candour and the warmth of his disposition gave full relief both to his virtues and his defects. He regarded concealment of any kind and under any circumstances as disreputable to an honourable man; and acting up to this opinion, he invariably expressed his sentiments without the slightest reserve, even when by so doing he prejudiced his own interests and those of his dearest friends. His love of truth, and the boldness with which he attempted to subvert all systems and opinions which did not accord with his own, and which sometimes partook rather of a spirit of fanaticism than of pure philosophy, excited against him a crowd of detractors and enemies. The extreme irritability of his temper led him on several occasions to acts of ingratitude towards Lemonnier, his early tutor and friend, who, to use Lalande's own expression, "refused to see him during an entire revolution of the moon's nodes." His attachment to his native town was such that he made a point of visiting it every alternate year during the college vacation; and upon these occasions he gave public lectures, founded an Academical Society, and neglected nothing which might inspire a love of science and of letters. His filial affection induced him frequently to attend the devotions of his mother, although the creed which she had so zealously endeavoured to inculcate had been greatly modified, if not altogether eradicated, by his intercourse with Voltaire and others while at Berlin.

To conclude, although his moral character is not altogether irreproachable, he was always ready to patronise the needy votary of science, and he would advocate the cause of a friend at the risk of his own personal safety.

The following is a list of his principal publications:—

'Navigation, its History, Theory, and Practice,' 4to, Paris, 1793; 'The Physician's Almanack,' Paris, 1800; 'The Geographical and Chronological Almanack,' 1799-80; 'Astronomy,' 1st edition, 2 vols. 4to, 1764; 2nd ed., 4 vols. 4to, 1771-81; 3rd ed., 3 vols. 4to, 1792; the same work abridged, Amsterdam, 1774; 8vo, Paris, 1775-95; 'Astronomy for Ladies,' last edition, 1824; 'Astronomical Biography,' 4to, 1803; 'Treatise on Canals in general, and in particular of the Canal of Languedoc,' Paris, fol., 1778; 'Transit of Venus,' 4to, 1764; 'Description of a Machine for dividing Mathematical Instruments, translated from the English of Ramsden,' 1790; 'A Discourse tending to prove "That the spirit of justice constitutes the glory and security of empires,"' to which the Academy of Marseille awarded their prize, 1757; 'Dissertation on Capillary Attraction,' 1770; 'Ephemeris of the Heavens,' 1775-1800; 'Exposition of Astronomical Calculations,' 1762; 'French Celestial History,' 1801; 'Letter to Cassini on the subject of Saturn's Ring,' 1773; 'Memoir on the Interior of Africa,' 1795; 'Reflections upon Comets which may approach the Earth,' 1773; 'Astronomical Tables for the Meridian of Paris,' 1770; 'Portable Logarithms,' 1802; 'Treatise on the Tides,' 1781; 'Journey to Mont Blanc,' 1796.

The whole of the papers of Lalande in the 'Memoirs of the Institute' were contributed between the years 1751 and 1806. Of these the most important are: 'On the Parallax of the Moon, and its Distance from the Earth,' 1752-53-56-57; 'On Secular Equations, and on the Mean Motions of the Sun, Moon, Saturn, Jupiter, and Mars,' 1757; 'On the Theory of Mercury,' 1766-67-68-86; 'On the Solar Spots and Rotation,' 1776-78; 'On Herschel's Planet,' 1779-87; 'On the Length of the Solar Year,' 1782; 'Observations of 8000 Northern Stars,' 1789-90. He likewise superintended an edition of the 'Astronomy' of Lacaille, Bouguer's 'Navigation,' Flamsteed's 'Celestial Atlas,' Fontenelle's 'Plurality of Worlds,' and in conjunction with Laplace and others he edited the latter volumes of Montucla's 'History of the Mathematics.'

(Delambre, *Eloge de Lalande*, in the 'Memoirs of the Institute,' 1807, and notice of his life in the 'Biog. Univers.'; Hutton, *Mathematical Dictionary*; Quéraud, *Dictionnaire Bibliographique*.)

LAMARCK, JEAN-BAPTISTE-PIERRE-ANTOINE DE MONNET, CHEVALIER DE, a celebrated botanist and zoologist, member of the ancient Academy of Sciences, and afterwards of the Institute, was born on the 1st of August 1744 at Bazentin, in Picardy, of a noble family. He was originally destined for the Church, and

received his education at the Jesuits' College at Amiens, where he was noted for that assiduous application to study which had so great an influence over his future career. Being desirous however at that time to follow the profession of his ancestors, at the age of seventeen he left college and entered the army, in which he served under Marshal Broglie in the long war against the English and Dutch. He greatly distinguished himself by his bravery, but accident turned his talents into another channel; for, being wounded and suffering from ill health, he was obliged to quit the military service. He then went to Paris to study medicine, but it does not appear that he ever did anything in that science, for we find him turning his attention to natural philosophy, and in 1778 he communicated to the Academy of Sciences some observations on the laws which regulate the formation and dispersion of clouds. The Academy engaged him to prosecute his researches on this subject, but he now commenced another branch of science which conducted him rapidly to celebrity, namely, botany. At this time Bernard de Jussieu was engaged in arranging the plants of the Jardin du Roi, according to their natural affinities; and at the same period the ingenious but artificial system of Linnæus was at its height of popularity. M. Lamarck undertook to form a new arrangement, which should be intermediate between the others, selecting the most easily-reconciled parts of both; he also borrowed from the older system of Tournefort, who formed the principal characters of his classes and orders on the modifications and form of the corolla. Lamarck thus constructed a new method of classification, according to which he arranged all the known species of plants indigenous to France. He named this work the 'Flore Française,' and presented it to the Academy of Sciences, who were highly pleased with it. The work particularly attracted the attention of Buffon, who had sufficient influence to get it published at the expense of government for the benefit of the author, whose circumstances at that time were narrow. The 'Flore Française' appeared in 1780, bearing the date of 1778, in 3 vols. 8vo. In 1779 Lamarck was elected a member of the ancient Academy of Sciences. In his 'Flore' he announced that it was his intention to set about a general work on plants, and accordingly he commenced collecting materials for that purpose, and chance threw in his way several rich herbaria, among others that of Sonnerat. Having a great wish to travel over France and Europe, he obtained an appointment, through the influence of Buffon, to visit the different botanic gardens and celebrated collections of plants in Europe, for the purpose of procuring curious and rare specimens for the Jardin du Roi. Buffon's son accompanied him, and they travelled through the greater part of Germany and the Low Countries. On his return to Paris he continued to cultivate botany with the same ardour as before, and was admitted to the botanical excursions of J. J. Rousseau, on condition that he should not appear to take any notice of either the person or actions of that extraordinary man, whose temper was so irritable that he was annoyed by the slightest circumstance. He now commenced arranging the results of his researches, but instead of forming a separate work they received another destination; for Pankouke having formed the plan of the 'Encyclopédie Méthodique,' engaged the most learned men in each department; and Lamarck, who undertook the botany, was one of the first contributors, and among the most active, for in 1783 his first volume was ready for publication, containing a history of botany, preceded by an introduction to the science: this composition, though good in some respects, shows marks of the precipitation with which it was written. A second volume appeared in 1788, and everything promised a speedy completion of the subject, when the publisher proposed to M. Lamarck to execute a series of plates to illustrate the different genera of plants. These appeared arranged according to the Linnæan system, though contrary to the wish of the author. It was the original intention that each fasciculus of plates should have been accompanied with explanatory letter-press, but this only appeared with the first; nine fasciculi of plates came out, but they were never completed. The publication of the 'Encyclopédie' was now arrested by the breaking out of the revolution, and with this event Lamarck's botanical labours ceased.

In 1788 Lamarck had been appointed assistant to Daubenton in the 'Cabinet du Jardin du Roi,' where he was particularly intrusted with the charge of the vegetable department. Here nothing could disturb him from his peaceful occupations and studies, and he remained unmolested amidst all the troubles and horrors of the revolution. During the reign of terror he proposed a plan for organising the Museum, and though little attention was paid to it at the time, he had afterwards the satisfaction to see it realised in the establishment of the institution of the Museum in 1793. But notwithstanding his talents and labours, Lamarck was near being forgotten among the professors of the new institution. Botany was the only science which he was well qualified to teach, and in this department Desfontaines and Jussieu were appointed to the new chairs. The subject of zoology only remained, to which, with the exception of conchology, Lamarck had paid little attention. This branch was divided into several sections: the vertebrated animals were given to M. Etienne Geoffroy, since known as the illustrious Geoffroy Saint-Hilaire, who afterwards shared this department with M. Lacépède, who was then absent and persecuted; the latter undertook the reptiles and fishes. The remaining classes of the animal kingdom, comprising all the *Invertebrata*, which were then considered of little interest, were left to

Lamarck, who, putting forth all his zeal in their investigation, and all his talents in their classification and description, showed that they are almost as complicated in structure and interesting in history, and incomparably more numerous, than the beings higher in the scale of creation. The 'Système des Animaux sans Vertébrés,' published in 1801, was the fruit of his profound researches, and laid the foundation of his greater work, the 'Histoire Naturelle des Animaux sans Vertébrés,' published at Paris from 1815 to 1822 in 7 vols. 8vo. This is the most valuable of all his labours, and ranks among the first modern works on natural history. Lamarck commenced his lectures in the Museum in 1794, being then fifty years old, and he continued to deliver them up to 1818, when, becoming almost blind and very infirm, he was obliged to resign, and was replaced by one of his colleagues in the Institute, M. Latreille. His eyes becoming affected during the compilation of his last work, the 'Mémoires sur les Coquilles,' published in the 'Annales des Muséum,' he was assisted in the bivalves by M. Valenciennes, and in the remaining classes by his eldest daughter, Mademoiselle Lamarck. He died in Paris, in December 1829, at the advanced age of eighty-six.

Lamarck is chiefly known in this country by his excellent arrangement of the *Conchifera*, or Testaceous *Mollusca*, in which department he made so great a change that he left comparatively little to be done by those who came after him; but though we admire the talents, judgment, industry, and extensive knowledge which this able naturalist possessed, we must regret the absurd and fanciful theories which he introduced into his writings and lectures. He supposed that all organised beings, from the lowest to the highest forms, were progressively developed from similar living microscopic particles. This may be called the theory of metamorphosis, according to which a formative substance is held to exist, but is allowed to change its form in order to be converted into a new being. He was also an advocate of the doctrine of spontaneous generation; and, according to his theory, it was only necessary to suppose a soft gelatinous mass of amorphous but organic matter to become traversed by surrounding fluids in order to produce a permanent living movement or growth: if the mass was destitute of irritability, it became the type of vegetable life; if it possessed that property, animal. Afterwards he pretended that use and circumstances determined the existence of new organs, which rendered the beings more or less perfect. These principles are only a continuation of those which Maillet and Buffon had before promulgated.

In his great work he adopts the same theories: he divides the animal kingdom into three classes, the 'Apathiques,' the 'Sensibles,' and the 'Intelligents;' and after having followed the order of progression by which nature conducts the different beings to perfection, he regards intelligence solely as the expression of the will of the Supreme Being. These theories are inconsistent even with his own words, and are almost too ridiculous to be repeated. Lamarck wrote many other works and papers.

* LAMARTINE, ALPHONSE (original name, DU PRAT), was born at MAÇON, in the province of Bourgogne (department of Saône-et-Loire), France, on the 21st of October 1792. His father was a cavalry major in the royal service; his mother was the daughter of a lady who had been under-governess in the family of the Duke of Orleans. The infant recollections of Lamartine go back to the scenes of the Reign of Terror, when his father was imprisoned as a royalist. After the fall of Robespierre his family retired into country seclusion at Milley; and here, and subsequently at the College of the Pères de la Foi at Belly, Lamartine was educated. After a short residence in Lyon, and a tour in Italy, he took up his abode in Paris, where he chiefly resided during the period of the empire, preparing himself by study, efforts in verse, and social amusements, for his future career. Inheriting the royalist or Bourbon sympathies of his family, he entered the military service of Louis XVIII. on Napoleon's fall and exile to Elba; but after the Hundred Days and the final confirmation of Louis XVIII. on the throne, he quitted the army and became a journalist. In 1818 he made a second tour in Italy. The year 1820 however was the beginning of his fame: in that year appeared his 'Méditations Poétiques.' French literature had been so long destitute of anything like impassioned or sentimental poetry, except what came in the form of translations from Byron, that this work was received with prodigious eagerness. Within four years 45,000 copies were sold; and the author was hailed as a new French poet of an order different entirely from that of Beranger: Beranger being the poet of the empire and revolution—Lamartine of royalty and religion, and a revived spiritualism, like that of De Maistre. The government of Louis XVIII., blind as it was in such matters, saw the advantage of promoting a man like Du Prat, and he was appointed attaché to the French embassy at Florence. Here he resided, first as attaché, and afterwards as chargé d'affaires, till the eve of the revolution of 1830, except during a short time when he held the secretaryship of the French embassy in London. His visit to England led to his marriage with an English lady of large fortune; and about the same time a wealthy uncle bequeathed him a considerable amount of property on the condition that he should assume the name of Lamartine. While in Florence he was wounded in a duel with General (then Colonel) Pepé, since so distinguished as an Italian patriot—the quarrel arising out of some remarks of Lamartine derogatory to the national character of the Italians. At Florence also he composed a variety of poetical

works, which were published successively: his 'Nouvelles Méditations,' published in 1823, and which were less successful than the first; his 'Mort de Socrate,' published a year or two later, and of which an English translation appeared in 1829; his 'Dernier Chant du pèlerinage d'Harold' ('Last Canto of Childe Harold's Pilgrimage'), published in 1827 and translated into English (in which work the expressions occurred which led to the duel with Pepé); his 'Épîtres;' and finally, his 'Harmonies Poétiques et Religieuses.' In all these works there breathed the same ardour of religious sentiment, the same hatred of revolution and of the empire, and the same spirit of loyalty to the Church and to the Bourbons which had distinguished his first literary appearance.

In 1829 M. de Lamartine returned to France. He was nominated by Charles X. to be his minister plenipotentiary in the newly-established kingdom of Greece; but before he could proceed on his mission the revolution of July 1830 occurred, and the Orleans dynasty came to the throne in the person of Louis-Philippe. The new government offered to continue M. de Lamartine in his post of plenipotentiary in Greece, but he declined the offer. The revolution however, brought about as it had been by the folly of the restored Bourbons, produced a profound impression on his fervid spirit; and the year 1830 begins a new era in the life of M. de Lamartine. With the exception of 'Jocelyn,' published in 1836, 'La Chute d'un Ange,' published in 1838, and a few minor songs and the like collected in 1839 under the title of 'Recueils Poétiques,' his poetical period ceases in 1830; his life having been since spent mainly in political activity and in prose composition. "I wish," he said, at this turning-point of his career, "to enter the ranks of the people—to think, speak, act, struggle with them;" in other words, he was no longer a mere Bourbonist or Legitimist—he was a man of generous aspirations and religious ideas, identifying himself with the French people, and desirous of seeing how far these aspirations and ideas could be carried out in politics. One of his first efforts in his new vocation was a pamphlet against the punishment of death, on which question he has always battled strongly. He attempted also to obtain a seat in the Chamber of Deputies under the government of Louis-Philippe, but failed. The leisure thus thrown upon his hands he determined to employ in a tour in the east. Setting sail in May 1832, he spent sixteen months in travelling through the Oriental lands, suffering during this time a heavy calamity in the death of a beloved daughter at Beyrout. He had travelled over various parts of the Holy Land, and was at Jerusalem, when the news that he had been elected to the Chamber of Deputies by the Legitimist constituency of Bergues drew him back to France. He ascended the tribune for the first time on the 4th of January 1834, and from that day his success as an orator was admitted. He figured among the political leaders of the day as a 'progressive conservative'—a man strangely blending a reverence for the antique with a kind of philosophic democracy. He spoke frequently on social and philanthropic questions. In 1838 he became deputy for Maçon. At one time it appeared as if he might have held a portfolio as minister under Guizot; but gradually he let it be known that the "vulgar utility," as he called it, of the government of Louis-Philippe was not to his mind; and in the year 1845 he openly joined the liberal opposition. Meanwhile he was putting forth various remarkable writings in prose (in addition to the above-named in verse), revealing his views of history and of passing affairs. Thus, in 1834, on the occasion of a republication in a collective form, in four volumes, of all his poems written up to that time, he prefixed a prose dissertation, 'Des Destinées de la Poésie;' in 1835 there appeared, as three additional volumes of his works, his famous 'Souvenirs, Impressions, Pensées, et Paysages, pendant un Voyage en Orient,' of which work there are well-known English translations; and (not to mention numerous articles and tracts on passing questions, published either separately or in journals) in 1840 was published a collection of papers entitled 'Vues, Discours, et Articles sur la question d'Orient.' But the great work of M. de Lamartine during the latter part of the reign of Louis-Philippe was his 'Histoire des Girondins,' portions of which had been published from time to time in journals, but which appeared complete in 8 vols. in 1847. This work (which has since passed through several editions, and of which English translations exist) is believed to have had a vast effect in disgusting the French with the rule of Louis-Philippe and his minister Guizot, and in preparing the outburst of the revolution of 1848.

When this revolution occurred M. de Lamartine was the man of the moment. During the agitation of the Reform banquets his courage animated the Liberals; and in the actual turmoil of the February insurrection he exerted his eloquence in a most memorable manner, both in preventing any compromise between the revolution and the Orleans family, and also, on the other hand, in arresting the progress of the revolution itself to its extreme issues. At the risk of his life he withstood the demand of the insurgents and their leaders that the red flag should be substituted for the tricolour as the emblem of the new republic. Elected a member of the Provisional Government, he became Foreign Minister of the republic, and in this capacity he exerted himself also to avoid that universal war of revolutionary propagandism and interference with other countries which the more extreme revolutionists desired. He explained his views in a printed manifesto entitled 'Manifesto à l'Europe: Circulaire du Ministre des

Affaires Étrangères aux Agents Diplomatiques de la République Française' (1848). A farther account of his conduct and policy at this crisis was published in his 'Trois Mois au Pouvoir,' in the same year, 1848.

M. de Lamartine's popularity was short-lived. Although his magnanimity, and courage, and enthusiasm had made him the very foremost man during the days of February, his conduct subsequently did not satisfy the instinctive or expressed wishes of his countrymen; and at the general elections of 1849 he was so little cared for that it was with difficulty he was returned to the Chamber—he for whom a few months before six constituencies had contended. Though nominated for the presidential office along with Louis-Napoleon and Cavagnac, he had but a scanty number of votes. During the rule of Louis-Napoleon, first as president and next as emperor, M. de Lamartine, like the other statesmen of the revolution, has been all but laid aside from public life. In his compulsory leisure however he has been busier with his pen than almost any of his contemporaries. Of his works published since 1848, the most important are the following:—'Raphaël, pages de la vingtième année,' a kind of poetical autobiography, 1849; 'Histoire de la Révolution de 1848,' 2 vols., 1849; 'Les Confidences,' also autobiographical, 1849, with a continuation in 1851 entitled 'Nouvelles Confidences'; 'Toussaint l'Ouverture,' a tragedy in five acts, 1850; 'Geneviève: Mémoires d'une Servante,' 1851; 'Histoire de la Restauration,' the publication of which began in 1851; 'Histoire de la Turquie,' begun in 1854; and various works of detached memoirs and biographical sketches published within the last few years under different titles. Some of these works (nearly all of which are translated into English) were printed originally, in part at least, in the columns of journals; and since 1848 M. de Lamartine has himself conducted one or two journals, more particularly the 'Conseiller du Peuple.' His later works, though brilliant and fervid, contain marks of literary haste, which is accounted for by the fact that many of them seem to be written for the sake of the earnings, which have become necessary to the author; some of them have also given offence by a tone of vanity and egotism passing all ordinary bounds. But all in all, M. de Lamartine will be remembered as one of the most remarkable and high-minded Frenchmen of his generation. There are various editions of his collective works, but none so recent as to include all; indeed were all included (miscellaneous pamphlets and articles, as well as books) the number of volumes would be alarming.

LAMB, CHARLES, was born February 18, 1775, in Crown Office Row, Inner Temple. His father was clerk to Mr. Salt, one of the benchers of the Inner Temple, and both master and servant (the latter under the name of Lovell) have received honourable commemoration in the 'Essays of Elia.' Born in the Temple, Lamb was educated at Christ's Hospital. Thus his early life was spent in the most old-fashioned and busy parts of London: a circumstance which probably exercised a strong influence over his character and habits. For though many passages in his works indicate a lively power of relishing the beauties of inanimate nature (see for example his 'Letters,' vol. i., p. 221) his relish was as of a luxury, to be enjoyed distantly, and at intervals; his cravings were for the excitement of society, the splendours, oddities, and squalidness of the metropolis. This feeling breaks out everywhere in his 'Letters.' "I often shed tears," he says, "in the motley Strand, for fulness of joy at so much life." (See vol. i., p. 182, 213, &c.) Coleridge was his school-fellow, and thus was laid the foundation of a friendship which endured through life. Labouring under an impediment of speech, which prevented his succeeding to an exhibition in one of our universities, Lamb was driven for subsistence to the uncongential labours of the desk: he became in 1792 a clerk in the accountant's office in the India House, in which, rising in place and salary, he continued a regular labourer till March 1825, when he was allowed to retire upon a handsome pension. His printed works, he says somewhere, were but recreations: his real ones being contained in some hundred volumes on the shelves of Leadenhall-street. But strongly as he felt, almost to repining, the irksome bondage of his daily duties, he was duly sensible of the value of a certain income and a fixed employment: and earnestly dissuaded one of his valued friends from exchanging the drudgery of a commercial life for the precariousness of a dependence upon literary labour. His own feelings on obtaining his liberty are beautifully recorded in 'The Superannuated Man,' one of the 'Last Essays of Elia.' Throughout life Lamb remained unmarried, he dwelt through life with an only sister, to whom he was linked by a community of tastes, and by the strongest ties of affection strengthened to the utmost by the painful circumstances which had imposed on him the duty of watching over her with a degree of anxious solicitude far beyond what is usually felt. His sister had in a fit of insanity, in September 1796, suddenly killed her mother; but her insanity being evident, she was by the jury's verdict delivered into the keeping of her brother—and to this duty the rest of his days were religiously dedicated. Except at intervals, when she voluntarily removed for a brief space to an asylum, she was restored to a perfectly sane state, and the devotion of her brother was tenderly and earnestly reciprocated. Charles Lamb died in consequence of an accident, apparently trifling, December 27, 1834. His sister survived him some years.

Lamb's first appearance as an author was in a small volume of poems published jointly with Coleridge and Lloyd. This association brought on him the wrath of the 'Anti-Jacobin'; as did his drama of 'John Woodvil,' published in 1801, the heavier fire of the 'Edinburgh Review.' An increasing relish for our older poets, and for those who in our own day have sought inspiration from them, or from nature herself, has caused the beauty and feeling of Lamb's poems to be better appreciated. Still his popularity depends more on his prose writings; and especially on his 'Essays of Elia,' which were begun in the 'London Magazine,' and collected afterwards in two small volumes. They abound in references to the author's character, history, and habits; and with the two volumes of 'Letters,' published by Mr. Justice Talfourd, present a minute and most interesting picture of a mind quaint, humorous, full of high and lovely thoughts and feelings, and affection for all things animate, and more indulgent to the weaknesses of others than its own frailties. To these must be added the 'Final Memorials,' published by Talfourd in 1848 in two additional volumes, in which the story of Lamb's sister was published for the first time, and which must be carefully considered by any one who would form a just estimate of the man as well as the author. The preface to the 'Last Essays of Elia,' is an exquisite sketch, by Lamb himself, of his own character.

His works are contained in two vols. 12mo, 1818, 'Essays of Elia, Album Verses, &c., 1830; 'Specimens of English Dramatic Poets who lived about the time of Shakspeare,' 1808. They have recently been republished by Mr. Moxon, the poems in one, the prose in three volumes. The 'Farewell to Tobacco' and the 'Essay on Roast Pig' are admirable specimens, in verse and prose, and in widely different styles, of his peculiar and easy humour. 'Christ's Hospital Thirty-five Years ago;' 'The Old Benchers of the Inner Temple;' 'Blakesmoor,' &c., show his power of throwing a charm round things indifferent in themselves, but endeared to him by early association. As specimens of his criticism we may instance his essays 'On the Genius of Hogarth,' and 'On the Tragedies of Shakspeare.' His serious is no less admirable than his humorous vein, and is always pregnant with some healthy and benevolent moral. We doubt whether his works are yet, or will be, widely popular: for there was an original quaintness in his character, nourished by his habits and studies, which those only who have something similar in their temper and pursuits will fully relish. Few however have enjoyed so fully the affectionate admiration of a large and varied circle of friends: and having with them encountered and surmounted much ridicule, he will hold an honourable place in our literature along with Coleridge, and others whose friendship, in life, he regarded among his most precious privileges, and with whom he would be best pleased to be associated in fame.

LAMBARDE, WILLIAM, an eminent lawyer and antiquary, the son of John Lambard, an alderman of London, was born October 18, 1536. Of his early years we know nothing, till in 1556 he entered at Lincoln's Inn as a student. Here he studied under Lawrence Nowel (the brother of Dean Nowel), a person eminent for his knowledge of antiquities and of the Anglo-Saxon tongue, from whom Lambard imbibed the notion that an acquaintance with the customs and jurisprudence of the Saxon times would be useful to him in his profession. The first fruits of his studies appeared in a collection and translation of the Saxon laws, under the title of 'APXIONOMIA, sive de Priscia Anglorum Legibus Libri,' 4to, 1563, afterwards republished in 1644 by Abraham Wheloc, with Bede's 'Ecclesiastical History.' In 1570 we find him residing at Westcombe, near Greenwich in Kent, of the manor of which he was possessed, and where, without giving up his profession of the law, he devoted much of his labours to the service of the county. His 'Perambulation of Kent,' finished in 1570, was published in a small quarto volume in 1576. In 1574 he founded a hospital for poor persons at East Greenwich in Kent, said to have been the first founded by a Protestant. In 1578 he was admitted a bencher of Lincoln's Inn, and in 1579 was appointed a justice of the peace for the county of Kent, an office which he not only performed with diligence and integrity, but endeavoured to explain and illustrate for the benefit of other magistrates in his 'Eirenarcha, or the Office of the Justices of the Peace,' in four books, 4to, 1581; between which year and 1619 it was reprinted eleven times. He also published a small treatise on 'The Duties of Constables,' &c., 8vo, 1582, which was reprinted six times. In 1592 he was appointed a master in chancery by Sir John Puckering, lord-keeper; in 1597 keeper of the rolls and house of rolls in Chancery-lane, by Sir Thomas Egerton, lord-keeper, and in 1600 keeper of the records in the Tower. He died at his house at Westcombe, August 19, 1601, and was buried in the parish church of East Greenwich. The monument placed over him, upon the rebuilding of that church, was removed to the parish church of Sevenoaks in Kent, where is still the seat and burying-place of his family. Lambard's 'Archeion, or a Discourse upon the High Courts of Justice in England,' was not published till 1635 by his grandson Thomas Lambard: another work, originally intended as a general account of Great Britain, he relinquished upon finding that Camden was engaged upon the same project. The materials which he had collected for it were published in 1730, in 4to, under the title of 'Dictionarium Angliæ Topographicum et Historicum.' Lambard was one of the most accurate antiquaries of his day, and in all respects a man of learning and worth.

LAMBERT, JOHN, is said to have been born of a good family, probably about 1620, and to have been educated for the bar. On the breaking out of the contest between the king and the parliament, he abandoned the study of the law, and joined the parliamentary army, in which he is mentioned as holding the rank of colonel at the battle of Marston Moor (2nd of July 1644). After distinguishing himself at Naseby, with Cromwell in Scotland, at Worcester, and on other occasions, and rising to the rank of major-general, the appointment of Fleetwood on the death of Ireton (November 1651) to the chief command of the forces in Ireland produced an alienation between Lambert and Cromwell which was never wholly healed, although he was one of the officers whom Cromwell summoned in June 1653 to take upon them the settlement of the government, and he was in May 1655 appointed by the Protector one of his eleven major-generals, as they were styled, or commanders of the military forces in the several districts of the kingdom. Lambert's district comprehended the five northern counties of Durham, Cumberland, Northumberland, Westmorland, and Yorkshire. He took little part in public affairs however during the life of the Protector. The most important part of Lambert's career is comprised within the space of about twenty months that elapsed between the death of Oliver Cromwell and the return of the king. He became the soul of the confederacy of discontented officers, which after the meeting of his first parliament, in January 1659, was formed against the new protector Richard, and which speedily effected the deposition of that feeble and unambitious personage. [CROMWELL, RICHARD.] Lambert was now accounted the head of the Fifth-monarchy Men, or extreme republican and Independent party. On the breaking out of the Royalist insurrection in July, he was sent by the Rump Parliament to suppress it, a business which he performed with extraordinary vigour; but immediately after his success he turned round upon the parliament, and, on its resistance to his demands, dispersed it by military violence on the 13th of October. The part taken by Monk however, and the falling away of their partisans on all hands, soon reduced Lambert and the cabal of officers, or Committee of Safety, as they called themselves, to extremities; and by the beginning of January 1660, having been deserted by almost the whole of the force with which he had set out for the north to encounter Monk, he was seized by orders of the restored parliament and committed to the Tower. On the 9th of April following he made his escape from confinement, but Colonel Ingoldsby recaptured him at Daventry, on the 22nd of the same month, when he was already at the head of a considerable body of horse, the greater part of which however deserted him at the critical moment. He was excepted from the Act of Indemnity passed after the Restoration; but although he was in June 1662 brought to trial before the Court of King's Bench along with Sir Harry Vane, he was, after being found guilty, reprieved at the bar, the distinction made between the two prisoners being expressly placed by the judges to the account of his comparatively dutiful and submissive behaviour in the course of the trial. He was eventually banished to the Island of Guernsey, where he lived for above thirty years.

LAMBERT, JOHN HENRY, a distinguished philosopher of Germany, was a descendant from a family which had been compelled to quit France in consequence of the persecutions caused by the revocation of the Edict of Nantes, and he was born at Mulhausen in Upper Alsatia, August 29th, 1728. He was sent to a school in the town, where he acquired the rudiments of a classical education; but the want of means obliged his father, who was by trade a tailor, to withdraw him from thence at an early age. At home however the youth availed himself of every means in his power to preserve the knowledge he had acquired of the Latin tongue; and a great part of each night was spent in reading such of the Roman authors as he could procure, or in studying arithmetic and geometry; the money for the purchase of the books, and even of the candles by whose light they were read, being obtained, it is said, by the sale of drawings which he found time to execute.

A taste for literature and science in a young person so situated, did not fail to attract notice; but the only immediate advantage which Lambert derived from that taste arose from the neatness which the practice of transcribing had given to his handwriting: this qualification procured for him an appointment as a clerk in the office of a solicitor; and he was afterwards employed, in a like capacity, by an iron-master of the neighbourhood. At seventeen years of age he became the secretary of Dr. Iselin at Basel; and during the five years in which he held this situation he omitted no opportunity of extending his literary attainments. He then also began to acquire a knowledge of philosophy and logic by the study of the works of Locke, Mallebranche, and Wolf; and he zealously cultivated the mathematical sciences, in which alone it is observed he found that the processes of investigation lead directly to truth.

In 1749 his patron recommended him to M. de Salis, who was then the President of the Swiss Confederacy, as a tutor to his children; and having obtained the appointment, he went to reside with the family of that statesman at Coire. Being thus placed in a situation congenial with his taste, and having access to a considerable library—enjoying, moreover, the opportunity of conversing with learned men—he was enabled, while communicating instruction to his pupils, to study the Greek, Italian, and French languages; and particularly to

advance his knowledge of optics, astronomy, and philosophy. He was admitted at this time a member of the Physico-Medical Society of Basel, to whose 'Acts' he afterwards contributed several memoirs on mathematical and physical subjects.

In 1756 Lambert accompanied two of the sons of M. de Salis to the University of Göttingen, and proceeding from thence to Holland and France, he returned in 1758 to Coire. At Paris he had an opportunity of conversing with some of the celebrated men of the age, particularly D'Alembert and Messier, by the former of whom he was afterwards recommended to the king of Prussia, Frederick III. He quitted the family of Count Salis in 1759, and having been chosen a member of the Electoral Academy of Bavaria, he went to reside at Augsburg. In 1763 he was employed as one of the commissioners in settling the boundaries between the territories of the Valais and the duchy of Milan; and in the following year, in consequence of an invitation from the king of Prussia, he proceeded to Berlin, where he passed the remainder of his life. He was elected a member of the Berlin Academy of Sciences, to whose 'Mémoires' he made many valuable contributions; and he was also appointed Chief Councillor in the department of Buildings, on the establishment of a commission for superintending the improvements of the kingdom.

While in Holland Lambert published at the Hague a tract entitled 'Les Propriétés de la Route de la Lumière,' &c. (8vo, 1758), in which he examines the path of a ray of light refracted in the atmosphere, and points out some corrections which should be made, on account of refraction, in determining the heights of mountains; and in the following year he published at Zürich one which was designated 'Freye Perspective.' But one of the most important of Lambert's works is his 'Photometria, sive de Mensura et Gradibus Luminis, Colorum, et Umbræ,' which was published both at Leipzig and at Augsburg in 1760. In this treatise the author states, from his own experiments, the quantities of light reflected from the exterior and interior surfaces of glass, and he gives formulae for representing them. He compares the brightness of illuminated objects with that of the body which enlightens them; and he discusses the brightness of the image formed by a luminous object in the focus of a burning glass. He calculates the degrees of illumination on the different planets; and he describes instruments for measuring the intensities of differently-coloured light.

In 1761 he published at Augsburg a valuable work entitled 'Insigniores Orbitæ Cometarum Proprietates,' 8vo, in which are contained a formula for determining, in a parabolic orbit, the perihelion distance in terms of two radii vectores and the difference between the anomalies, and one in which, the orbit being any conic section, the interval between two times of observation is expressed in terms of the two radii and the chord which joins their extremities. This is usually called 'Lambert's Theorem,' and it was certainly discovered by him, though Euler had, long before, given a like theorem for a parabolic orbit. In the same year Lambert published at Augsburg a small work entitled 'Logarithmische Rechenstöße,' in which are proposed some improvements on Gunter's 'Scale;' and one entitled 'Kosmologische Briefe ueber die Einrichtung des Welthaus,' 8vo, in which he considers that the action of gravity extends to the fixed stars; and he expresses a conjecture that the solar system may be only a system of satellites with respect to some celestial body.

In 1764 was published, at Leipzig, in 2 vols. 8vo, Lambert's philosophical work entitled 'Neues Organon;' this is divided into four parts, of which the first contains the rules of thinking, and the second is on truth considered in its elements; the third is on the external characters of truth; and the fourth, on the means of distinguishing the real from the apparent. A sort of supplement to this work was published by him at Riga in 1771, in 2 vols. 8vo; it is entitled 'Architektonik,' and treats of the metaphysics of mathematics; the subjects being Unity, Number, Dimensions, Continuity, Limits, and Infinity.

The first mathematical work which Lambert published after he went to reside at Berlin was his 'Beyträge zum Gebrauche der Mathematik und deren Andveudung' (3 vols. 8vo, 1765 to 1772). This contains some profound investigations relating to the theory of numbers, and a tract on trigonometry, with notices on what is called tetragonometry; in it are given also some remarkable propositions relating to the projections of the sphere. In the first of those years he published 'Description d'une Table Ecliptique formant un Tableau vrai de toutes les Eclipses, tant de la Lune que de la Terre;' and in 1770 appeared his 'Zusätze zu den Logarithmischen und Trigonometrischen Tabellen,' 8vo. He was joined with Bode, Schultze, and Lagrange in the publication (1776), under the direction of the Academy of Berlin, of a series of Astronomical Tables.

Lambert also wrote a tract on 'Hygrometry,' which was published at Augsburg in 1770; and he left one on Pyrometry, which was published at Berlin, in 1779, that is, after his death; this last contains a biography of the author, by Everhard. Besides these works Lambert wrote numerous papers on scientific subjects, which were published in the 'Acta Helvetica' and in the 'Mémoires' of the Academy of Berlin. Among the 'Acta' are his 'Tentamen de Vi Caloris ejusque Dimensione;' a series which goes by his name, and which was afterwards generalised by Lagrange, and a 'Memoir on Vibrating Strings.' The 'Mémoires' of the Academy contain his papers on the Incom-

mensurability of the Circumference of a Circle to its Diameter; on Human Strength; on Hydraulic Wheels; on Windmills; and on Friction. He moreover prepared two papers in which he had discussed all the known observations on Jupiter and Saturn; and these were published in the same 'Mémoires' two years after his death.

Lambert was endowed with a strong memory and a fertile and well-regulated imagination: his manners were simple, and he is said, in his dress, to have disregarded the fashions of the time; but he was both esteemed and beloved by those who knew him intimately. He died September 25, 1777, being then only forty-nine years of age. All the manuscripts left by him were purchased by the Academy of Berlin, and were subsequently published by John Bernoulli, a grandson of the celebrated John Bernoulli of Basel.

LAMENNAIS, FELICITÉ-ROBERT, ABBÉ DE, the son of a ship-owner of Saint-Malo, was born at that port, on the 6th of June 1782. Prevented by the turbulence of the times from being sent to school, at the usual age, he received from his elder brother his first lessons in Latin, and then finished alone his stunted education. For all that, he was able to read Livy and Plutarch, when he was only twelve years old. In 1794, having been sent to live with an uncle, this relation not knowing what to do with a wilful boy, used to shut him up for whole days, in a library, consisting of two compartments, one of which, called "Hell," contained a large number of prohibited books, which little Robert was enjoined not to read. But the lad already cared for none but books of reflection, and finding some of these on the prohibited shelves, that division became his favourite. Long hours were thus spent in reading the ardent pages of Rousseau, the thoughtful volumes of Mallebranche, and other writers of sentiment and philosophy. Such a course of reading, far from producing its usual effects of precocious vain-glory and unbelief on so young a mind, served rather to ripen his judgment, and to develop that religious fervour which was a part of his nature. Thus left to himself for many years, he declined his father's repeated offers to settle him in some mercantile office, and in 1807 found means to enter the college of Saint-Malo, as teacher of mathematics.

He produced in 1808 his first work, 'Réflexions sur l'État de l'Église en France, pendant le 18^{Siècle}, et sur sa situation actuelle.' In this book he denounces the materialism propagated by the philosophers of the 18th century, and bitterly deploras the apathy thence induced to religion. His vocation being the Church, he took the tonsure, of his own accord, in 1811; and in 1812, in concert with his brother, published his 'Tradition de l'Église sur l'Institution des Evêques.' As the power of Napoleon I was dissolving, and the time seemed propitious for the diffusion of unfettered thoughts, he went to Paris in 1814, his first production being a violent pamphlet against the fallen emperor. This untimely philippic drove him from France during the Hundred Days; he sought refuge in England, spent several months as usher at a school kept by the Abbé Caron, near London; and then returning home in 1816, was at length ordained priest.

The following year was signalled by the appearance of his 'Essai sur l'Indifférence en matière de Religion;' a book which produced an impression so sudden and so deep, that in a single day, said his disciple Lacordaire, he rose like a new Bossuet above the horizon. But in this, as in all his former works, the Abbé Lamennais still adhered to the orthodox standard of Catholicism, no other theological writer going beyond him in upholding the clerical authority in preference to private judgment. In 1824 he visited Rome, met with the most flattering reception from Pope Leo XII, but declined the offer of the Cardinal's hat, made to him by that pontiff. His next work, 'La Religion considérée dans ses Rapports avec l'ordre Civil et Politique,' began to exhibit that freedom of thought, reaching to the last boundary of revolution (but which however, independent of church interests, abandons nothing in spiritual faith), for which he has since become so widely known. For this book he was summoned to appear before the Cour Correctionnelle, and condemned to a fine.

The general agitation and the ferment in the public mind, which preceded the fall of Charles X., had gradually produced a modification in the opinions of this enthusiast, whose faith was too sincere to be stagnant: the revolution of July induced him to adopt the principle of the people's supremacy. Still he continued the same full believer, and earnest worshipper in the Christian doctrine, as it is understood in the Roman Catholic Church. In attaching himself with equal warmth to the democratic principles, he pointed his objections at the temporal abuses of the Church; whilst his reverence for her spiritual authority remained unaltered. In September 1830, he brought out a journal, called 'L'Avenir,' in which several young men who had adopted his opinions, assisted him with their contributions. Among these were the Abbé Gerbet, the eloquent preacher Lacordaire, and M. de Montalembert. The object of this journal was to spread the system of the Abbé Lamennais, and to explain that it combined the advocacy of the interests of the Roman Catholic Church, and the defence of liberal opinions in connection with it; and to maintain that religion, so long neglected, and suffered to decline by the upper classes, ought to be, and might be regenerated by the common people. He likewise demanded, in this paper, the complete separation of the spiritual from the temporal power, insisting that political influence ought to be transferred to the multitude by means of universal suffrage. These

bold opinions, expressed in a style of eloquence, somewhat biblical in form, and of remarkable power, produced upon an excitable people an effect so manifest as to provoke the censure of Rome, in the form of an encyclical letter, of the 18th of September 1832. Having submitted to this rebuke by suppressing his journal, the abbé received a gracious letter of congratulation from the pontiff on the 28th of December.

But in May 1834, the new champion of independence in church matters, produced his most admired book, the 'Paroles d'un Croquant,' a pathetic lamentation, addressed alike to the suffering classes, and to the great and powerful; a work which sundered for ever the bond that united Lamennais to the see of Rome. Irritated by this new provocation, Gregory XVI, in a second letter, dated July 7, 1834, condemned the book in very severe terms; whilst the revolutionary party applauded their advocate for his independent spirit and original powers of mind. Thus stigmatised by the Church, prosecuted by government, and by the people hailed as an apostle, the Abbé Lamennais set no bounds to his course. He now produced in rapid succession: 'Les Affaires de Rome,' in 1836; 'Le Livre du Peuple,' in 1837; 'Le Pays et le Gouvernement,' in 1840 (for which he was sentenced to a year's imprisonment); 'De la Religion,' in 1841; 'Le Guide du Premier Age,' in 1844; 'Une Voix de Prison,' in 1846; and 'Les Conseils de l'Abbé Lamennais au Peuple,' in 1849. His most elaborate work 'Esquisse d'une Philosophie,' was published in 4 vols, 1840-46. He died February 27, 1854, unreconciled to the Church, though during his last illness the most strenuous efforts were made to induce him to retract his heterodox opinions: by his express desire he was interred without any religious ceremony. It was one of his last and most earnest injunctions that certain papers, which contained his latest sentiments, should be published without alteration or suppression; but the religious advisers of his niece (who was also his housekeeper) so far wrought on her susceptibility as to cause her to refuse to give up the papers to the persons whom Lamennais had authorised to superintend their publication. The matter was in consequence brought before the proper legal tribunal, when the judges directed (August 1856) that the papers should be handed over for publication in their integrity.

LA'MI, GIOVA'NNI, born at Santa Croce, in Tuscany, in 1697, studied law at Pisa, took a Doctor's degree, and afterwards repaired to Florence, to exercise his profession. But his fondness for literature, and especially classical and ecclesiastical erudition, interfered with his professional pursuits, and he became an author. His first work was in defence of the Nicene Creed concerning the Trinity, and against Leclerc and other Socinian writers. Lami contended that the Nicene dogma concerning the Trinity was the same as that held by the early promulgators of Christianity in the Apostolic times. His work is entitled 'De recta Patrum Nicenorum Fide,' Venice, 1730. Lami travelled with a Genoese nobleman to Vienna, where he resided some time, and he afterwards visited France, whence he returned to Florence in 1732, where he was made librarian of the Riccardi Library, and Professor of Ecclesiastical History in the Florence Lyceum. At Florence he published his work 'De Eruditione Apostolorum,' Florence, 1738, which is a sort of continuation of his former work.

In 1740 Lami began to publish a literary journal, entitled 'Novelle Letterarie,' which he carried on till 1760, at first with the assistance of Targioni, Gori, and other learned Tuscans of his time, with whom he afterwards quarrelled, and he then continued the work alone. Lami made a selection of inedited works, or fragments of works, from the manuscripts of the Riccardi Library, of which he was keeper, and published it in a series entitled 'Deliciae Eruditorum,' 18 vols. 8vo, Florence, 1736-69. He also edited the works of the learned John Meursius in 12 vols. folio. He wrote short biographies of many illustrious Italians of his age: 'Memorabilia Italorum Eruditione præstantium quibus vertens Sacculum gloriatur,' 2 vols. 8vo, Florence, 1743-47. He published in Greek the letters of Gabriel Severus, archbishop of Philadelphia in Asia Minor, and of other prelates of the Greek Church: 'Gabrielis Severi et aliorum Græcorum Recentiorum Epistolæ,' 8vo, Florence, 1754. He had undertaken to write a history of the Eastern Churches from the Council of Florence of 1439; but this undertaking was interrupted by Lami's death, which took place in 1770. He was buried in the church of Santa Croce. He left all his property to the poor. Fabbroni and Fontanini wrote his biography. Besides the works already mentioned, Lami wrote satires both in Latin and in Italian, especially directed against the Jesuits, whom he strongly disliked. He also published: 1, 'Lezioni di Antichità Toscana,' 2 vols. 4to, 1766; 2, 'Richardi Romuli Riccardii Vita,' Florence, 1748; 3, 'Catalogus Codicum MSS. qui in Bibliotheca Riccardiana Florentina adservantur,' with copious illustrations, fol., 1756, and other minor writings.

LA MOTTE, ANTOINE HOUDAR DE, was born at Paris, 17th of January 1672. His father was originally a hatter at Troyes, where he possessed a small estate called La Motte, whence the surname of the family was derived. After completing his studies at the Jesuits' College, he turned his attention to the law, which he shortly after gave up to follow his taste for the drama, and to assist at a private theatre in the representation of Molière's comedies. In 1693, being then only twenty-one years of age, he produced at the Théâtre Italien his first piece entitled 'Les Originaux,' with little success. This

piece has not been inserted among his works, but is printed in the 4th volume of Gherardi's 'Théâtre Italien.' Disappointed at his failure, he resolved to renounce the world, and retired with one of his friends to La Trappe, but the Abbé de Rancé, setting little value on the momentary enthusiasm of two inconsiderate young men, dismissed them at the end of two months, without giving them the habit of the order.

After returning to Paris he produced his opera 'L'Europe Galante,' which was very successful; in 1707 a volume of Odes, which, although much read, added nothing to his reputation; and in 1710 his 'Academical Discourse,' a model of the kind. His tragedy, called 'Ines de Castro,' is mentioned by Voltaire ('Siècle de Louis XIV.') as one of the most interesting of those which had kept their place on the stage.

The most presumptuous and extravagant act of La Motte was his translating the Iliad, without knowing a single word of Greek, and abridging that poem with the intention of improving it. This translation was preceded by a discourse, in which he endeavoured to prove that admiration for the ancients, and particularly Homer, was a modern prejudice. Madame Dacier refuted this discourse by a tract entitled 'Des Causes de la Corruption du Goût,' to which La Motte replied by his 'Réflexions sur la Critique.' At the age of forty he became blind, and also lost the use of his limbs, in which condition he remained for many years, and died 26th-December 1731. His works, including his letters to the Duchesse du Maine, were collected in 1754, and filled 10 vols. 12mo.

LAMOTTE-FOUQUÉ, FRIEDRICH-HEINRICH-KARL, FREIHERR DE, was born at Brandenburg on February 12, 1777. The family had been driven from France by the revocation of the edict of Nantes. His grandfather had entered the military service of Prussia, in which he attained a high rank and the friendship of King Frederick, who was the godfather of his grandson. He entered, in 1796, into the Prussian military service, from which, after taking an active service during the war for the liberation of Germany, he was forced to retire in consequence of ill-health, with the rank of major. He afterwards resided at Berlin, at Halle, and upon his estate of Nennhausen, near Rathedow. He had early devoted himself to literary pursuits, and came before the public at first under the assumed name of Pellegrin. Under this appellation he published a translation of the 'Numantia' of Cervantes, some poems in the Spanish style, the novel of 'Alwin,' 'Die Historie des edeln Ritters Galmy und einer schönen Herzogin aus Bretagne' ('The History of the noble knight Galmy and a beautiful duchess from Brittany'), and some dramas. The old northern mythology however, and the early German poets, had a stronger attraction for him: he quitted the imitative school, and with wonderful genius and fertility produced a succession of poems and tales of great originality and power. His first work, published under his own name in 1809, was the poem of 'Sigurd der Schlangentöchter,' distinguished by its vigorous fancy and its chivalric feeling. In 1813 he gave to the world his beautiful tale of 'Undine,' which has been translated into almost every European language, and is remarkable for the originality of its construction, the tenderness and delicacy of its feeling, and the ease and lucidity of its style. In 1814 appeared the romantic heroic poem of 'Corona;' in 1815 'Die Fahrten Theodolfs,' 'Der Zauberring,' and 'Sangers Liebe.' He had also produced two national dramas, 'Alboin der Longobardenkönig,' and 'Eginhard und Emma.' In 1818-19 he published in four volumes the 'Altsächsischen Bildersaal,' and in 1821 the historical epic of 'Bertrand du Guesclin,' in 3 vols., and 'Der Verfolgte.' 'Der Sängerkrieg auf der Wartburg' was published in 1828. From this time he was silent for a considerable period, and a change came over his mind. He had hitherto belonged to the romantic school; devotional feelings, chivalry and gallantry, formed the elementary principles of his fictions, and though in some his poetic forms appear forced and capricious, they are uniformly pervaded by a delightful fertility of fancy and a peculiarly vivid poetic feeling. He now seems to have abandoned his old mediæval taste, become more earnestly pious and conservative, and far more of a mannerist and graver in his style. This is first seen in his poems of 'Die Weltreiche,' published in 1835-40, and in his 'Zeitung für den deutschen Adel' ('Tidings for the German Nobility'), issued in 1840-41. In 1841 he published a selection of his works in twelve volumes. He also wrote a memoir of his grandfather (Lebensbeschreibung Heinrich-August de Lamotte-Fouqué), published at Berlin in 1824. He died at Berlin on January 23, 1843. The novel 'Abfall und Busse, oder der Seelenpiegel' ('Apostasy and Repentance, or the Looking-glass of the Soul'), was published after his death, in 1844.

LAMOTTE-FOUQUÉ, KAROLINE, FREIHERRIN DE, the first wife of the preceding, was born at Nennhausen in 1773, and died there on July 21, 1831. She was a prolific writer, and several of her novels, her letters on the object and direction of female education, and on the Grecian mythology, are still held in considerable estimation. Some of her narrative poems show a deep insight into the human heart, and particularly as it relates to the female character. Her letters and smaller essays were collected and published in 1833, under the title of 'Der Schreibtisch, oder alte und neue Zeit.'

LAMOUREUX, J. V. F., professor of natural history at Caen, was born at Agen in Guienne, in 1779. He particularly applied himself to the study of marine productions, both vegetable and animal, and in

1805 published at Agen some observations on many new and rare species of Fuci. In 1809 he was appointed professor at Caen, where he wrote his 'Histoire des Polypiers Coralligènes flexibles,' which appeared in 1816 embellished with fifteen plates, containing 150 figures drawn by the author. Before being printed, this work was presented to the Institute, of which Lamouroux was a correspondent. At first he only described those species of Polypi which were contained in his own collection, but afterwards he included all the species which had been described by other authors. Lamouroux, in his arrangement of these productions, divides them into 56 genera, only 14 of which were known before his time, and 560 species, 140 of which were new: thus, both as to genera and species, this work was the most complete that had been written on this family of animals. Lamouroux wrote several other works; he published in 1817 a description of a new species or variety of wheat, which has been successfully cultivated in some of the northern provinces of France, where it is called 'blé lamma.' He also wrote a 'Dictionary of Zoophytes,' which forms part of the 'Encyclopédie Méthodique;' it came out at Paris in 1824, in 4to. He died at Caen on the 18th of March 1825, at the early age of forty-six.

LAMPRIIDIUS, ÆLIUS. [AUGUSTA HISTORIA.]

LANCASTER, SIR JAMES, a skilful seaman, who received for his services the honour of knighthood from Elizabeth, conducted the first voyage undertaken by the newly-constituted East India Company, 1600-3, and established commercial relations with the princes of Achin in Sumatra, and Bantam in Java. He was a firm believer in a north-west passage; and his authority had much weight in promoting the numerous attempts made in that enterprising age to discover one. Lancaster's Sound, a deep inlet in Baffin's Bay, 74° N. lat., was named after him by Baffin, one of our most successful explorers. Relations of Sir J. Lancaster's first voyage to the East Indies in 1591, and of a successful predatory voyage against the Portuguese in Brazil in 1594, are given in Hakluyt's 'Voyages,' vol. iii.: his voyage to the East Indies in 1600-3 is contained in Purchas's 'Pilgrims,' vol. i. He died in 1620.

LANCASTER, JOSEPH, was born in 1771: his father had been a soldier in the foot-guards. Moved by a benevolent feeling towards the neglected children that surrounded his father's residence in the Borough-road, Southwark, Joseph Lancaster opened a school for their benefit, and obtaining a room without cost from his father, he fitted it up at his own expense; and before he was eighteen years of age had ninety children under his care. This was in 1793, a period of scarcity as well as of general ignorance; and necessity prompted him to make experiments in education, with a view to economy in teaching. He early attracted the attention of the Duke of Bedford; and in 1805 was honoured by an audience on the part of George III., who on this occasion said, "I wish that every poor child in my dominions may be able to read his Bible"—words which, being freely repeated, did much towards facilitating the increase of schools throughout the country. Joseph Lancaster was a member of the Society of Friends, and as a conscientious dissenter he declined flattering overtures of worldly advantages which could be enjoyed only by his joining the Established Church. From 1807 to 1811 he travelled in the kingdom nearly seven thousand miles, and lectured to nearly fifty thousand persons; and thus gave a great impulse to elementary education. In 1812 he attempted to establish a school for children of opulent parents; but he became insolvent, and in 1818 emigrated to the United States, where he was well received. In this country he rendered much service to education, but the effect of his labours was lessened by his want of prudence. In 1829 he visited Canada, and was honourably welcomed. The parliament of Lower Canada voted him several grants for educational purposes. Again he experienced great pecuniary difficulties, but some of his old friends united to purchase for him a small annuity. He died at New York on the 23rd of October 1838, having essentially contributed to the establishment of the system of mutual or monitorial instruction in most parts of the civilised world, under the name at first generally adopted in England of 'Lancasterian Schools,' and under the patronage of the British and Foreign School Society.

* LANCE, GEORGE, the most successful recent painter of fruit, and what is technically called 'still life,' was born at Little Easton, a village near Dunmow, Essex, on the 24th of March 1802. An early inclination for art was carefully fostered, and in good time he was placed as a pupil with Haydon [HAYDON, BENJAMIN], then in the full flush of his popularity. Under him of course the youth's attention was directed to 'high' or 'historical' art. The Elgin marbles had been recently brought to this country, and Haydon was earnest in season and out of season in directing public attention to them as exhibiting the noblest and most perfect examples of artistic skill. Haydon's pupils were set to make large finished drawings from them, and from the life, and at the same time to go through a course of careful anatomical studies in the dissecting room. These varied studies laid the foundation of Lance's future success as an artist, though that success was achieved in a line very different from that which his master contemplated. But during his pupilage his progress was far from rapid. It was not indeed till the accidental copying of some groups of fruit as a study in colour that the bent of his genius displayed itself. Still it was some time before the young artist could bring him-

self to abandon his dreams of 'high art,' or be content to give up his hopes of uniting in himself the excellences of Raffaele and Titian. While pursuing his historical studies, and when thrown on his own resources, he copied, as is usual, a good deal after the leading painters of various schools, and it may be mentioned as a proof of his dexterity in this craft that Mr. Lance claims to have repainted entirely certain considerable portions of the large 'Boar Hunt' by Velasquez, now in the National Gallery, it having while it was the property of Lord Cowley, been inadvertently damaged by the 'restorer' to whom it had been entrusted to clean.

As soon as Mr. Lance fairly gave up his lofty notions and devoted himself in earnest to painting fruit, dead birds, and the like, his rare ability began to make itself felt. Before his time such subjects had in England been left to painters whose artistic education had been of the most imperfect kind, and whose taste was usually on a level with their education. Lance brought to bear on this lower walk of art the technical knowledge and manual skill he had acquired in studying for the highest; and along with this he combined a natural aptitude for colour and a cultivated taste. Year after year as he continued to send to the exhibitions of the Royal Academy and the British Institution (where his works were always seen to the most advantage), his pictures displayed growing power. It was soon perceived that a really original painter had arisen, one as original in his line, and as thoroughly independent in his course, as Etty or Landseer in theirs; and while the uninitiated stayed to gaze with unquestioning admiration at the rare truth with which the luscious grapes and melons and other dainty fruit, or birds, were spread out on the cleverly copied piece of bass-matting, or piled on the costly plate, the students and practitioners of art looked with equal delight and almost equal wonder at the painter's perfect mastery over his materials, his skill in composition, and the exquisite arrangement of his colour, by which, while preserving to each peach or plum or grape its exact degree of light and shadow, of opacity or semi-transparency, its peculiar surface, and its most delicate bloom, as well as its precise colour, the whole was wrought into admirable harmony and unity of effect. In minute elaboration Mr. Lance has not attempted to rival some of the famous Dutch and Flemish fruit and flower painters, but for that he fully atones by a more manly style of execution; and where he has been tempted to finish more minutely than usual his pictures have certainly not gained by the additional labour. For many a year Mr. Lance seldom varied much in the titles of the pictures he sent to the British Institution—they were called either 'Fruit' or 'Game,' or by some equally general term: at the Academy he perhaps assumed the more sounding phrase of 'Preparation for a Banquet,' or 'Fresh from the Lake,' or 'Just Shot,' or 'Just Gathered.' But of late years he has occasionally enlarged his canvass and introduced into his composition, a 'figure' (as artists somewhat irreverently designate the 'human form divine'), and added some such title as 'The Seneschal,' without either figure or fruit benefiting by the conjunction. He has also coquetted, without much success, with history, as in 'Melancthon,' 'The Duc de Biron and his Sister' (1845); with genre, as 'The Grandmother's Blessing' (1844), 'The Blonde,' and 'The Brunette,' &c. But from these harmless aberrations Mr. Lance always returns with renewed power to his 'still life'; and in that class some of his more recent works as 'Modern Fruit—Medieval Art,' and 'Harold,' as he quaintly termed a gorgeous composition of fruit and flowers, with a peacock in all the glory of its expanded plumage, are in their way for truth to nature and glow of colour almost without a rival.

Mr. Lance is neither member nor associate of the Royal Academy, nor does the National Gallery contain any of his works. There are however in the Vernon collection two or three good examples from his pencil—'Fruit,' painted in 1832, 'Fruit,' 1848, and 'Red Cap,' a duplicate slightly varied from a picture originally painted for Mr. Broderip.

LANDEN, JAMES, a mathematician of the last century, was born at Peakirk, near Peterborough, in January 1719, and died at Melton, near the same place, January 1790. He was for many years agent to Earl Fitzwilliam; but no details have been published of his life, neither have we heard of any which it would be worth while to give.

The writings of Landen stretch over a long period, from his first essays in the 'Ladies' Diary,' in 1744, to his paper on rotatory motion in the 'Phil. Trans.' for 1785. The thing by which he is now most known is his attempt to derive the differential calculus from algebraical principles, often called his residual analysis. His writings, though they contain many curious and original theorems, yet are mostly upon isolated subjects, and, except as being all the work of one man, need no more detailed description than a volume of miscellaneous memoirs. They relate for the most part to points of the integral calculus, and of dynamics; we may take, for instance, his determination of the arc of an hyperbola by means of two elliptic arcs, in the 'Phil. Trans.' for 1775.

The writings of Landen which are not contained in the 'Philosophical Transactions' are, his 'Mathematical Lucubrations,' 1755; the 'Residual Analysis,' 1764; two volumes of 'Memoirs,' the first published in 1780, the second written near the end of his life, and published posthumously; 'Tracts on Converging Series,' 1781-82-83.

LANDON, LETITIA ELIZABETH (MRS. MACLEAN), generally known by her initials, 'L. E. L.,' was born in the year 1802 at Old

Brompton, a suburb of London. Her father was an army agent, and she was the niece of Dr. Landon, dean of Exeter, and the sister of the Rev. Whittington Landon. Her early years were spent with a relative in the country, at Trevor Park in Hertfordshire. She read a great deal, displayed a lively and inventive imagination, and began to write short poetical pieces at the early age of thirteen. Having returned to her father's residence at Old Brompton, where Mr. Jerdan, the editor of the 'Literary Gazette,' was a neighbour, she sent some short poems to that gentleman for his approval. They were published in the 'Literary Gazette' in the year 1820, and were followed by others, which were favourably received by the public. Her father soon afterwards died, leaving his family in reduced circumstances. She then began to devote nearly the whole of her time to literature, and not only supported herself by it, but contributed largely to the maintenance of her relatives. Her poems in the 'Literary Gazette,' which were signed 'L. E. L.,' excited a good deal of admiration, and the editor began to employ her in criticising books of general literature, chiefly poetry and works of fiction. The assistance which she thus gave to the editor, at first casual, by degrees became permanent, and for many years she was rather an effective colleague than an occasional contributor, so that her labours on the 'Literary Gazette' were, as Mr. Jerdan himself states, little less than his own.

Miss Landon's labours however were not confined to the 'Literary Gazette.' In 1821 she published 'The Fate of Adelaide, a Swiss Romantic Tale, and other Poems,' 12mo. This first collection of poems was succeeded by 'The Improvisatrice,' 'The Troubadour,' 'The Golden Violet,' 'The Golden Bracelet,' 'The Lay of the Peacock,' and, shortly after the announcement of her death, 'The Zenana, and Minor Poems of L. E. L., with a Memoir by Emma Roberts,' 12mo. She also contributed largely to the Annuals, and published three novels, 'Romance and Reality,' 'Francesca Carrara,' and 'Ethel Churchill.' Her poems are generally of a sentimental and melancholy cast, and the versification is loose and irregular, but always with a pleasing musical rhythm. Her poems, probably from their romantic character, rather than from their intrinsic value, were very popular in their day. Her novels were less successful. The romantic melancholy of her poems was entirely imaginative. In private life she was full of mirth, and her conversation was very lively and entertaining.

On the 7th of June 1838 Miss Landon was married to George Maclean, Esq., governor of Cape Coast Castle, now the principal fortress of the Gold Coast Colony, West Africa. She soon afterwards sailed from England with her husband, and had not been long settled in her new residence at the Castle when her death occurred, October 15, 1839. She had been for many years subject to spasms and hysterical affections, as a relief for which she was in the habit of taking, by the advice of her physician, small doses of prussic acid. When her female servant went into Mrs. Maclean's room, in the forenoon of that day, she found her mistress lying on the floor dead, with a bottle in her hand, having the label on it. She appears by some accident to have taken an overdose of the poisonous medicine. The coroner's jury found no cause for suspicion that her death had been produced intentionally. On the contrary, she had written in the morning of the same day a letter to one of her female friends in London, which was afterwards published, describing her occupations in lively terms, and expressing herself as contented and happy. In 1841 Mr. Laman Blanchard published 'The Life and Literary Remains of L. E. L.,' 2 vols.

*LANDOR, WALTER SAVAGE, was born at Ipsley Court, Warwickshire, on the 30th of January 1775. His father, Walter Landor, Esq., was a gentleman of ancient family and large property, which was much increased by his marriage with his second wife, Elizabeth Savage, a wealthy Warwickshire heiress. Walter Savage Landor was the eldest son of this marriage. He was educated with great care at Rugby School, and afterwards at Trinity College, Oxford. He was, at first, intended for the army, and then for the law; but a certain stubborn independence of spirit, accompanied by an earnest theoretical republicanism, led him to decline both professions, and to devote himself, on an income allowed him by his father, to a life of freedom and literature. In the year 1795 he published a volume of 'Poems,' thus following by only a short interval Crabbe, Burns, Wordsworth, Coleridge, Rogers, and others of the poets who began the new literary movement which signalled the close of the last century in Britain, and preceding Campbell, and Scott, if not Southey. In 1802, during the peace of Amiens, he visited Paris and saw the accession of Bonaparte to the consulship for life. In 1803 he published a Latin translation of his poem 'Gebir,' previously composed in English. On the death of his father he succeeded to the family estates, and bought others in Monmouthshire; but after expending large sums of money in building on his estates, and otherwise improving them, he became disgusted with the conduct of some of his tenants whom he had befriended, and (1806) selling off his property, part of which is said to have been in the possession of his family for seven hundred years, he resolved to be an English landlord no more, but to spend his life abroad as an untrammelled citizen of the world. In 1808 he raised men at his own expense and joined the Spanish patriots under Blake, then fighting for the independence of the peninsula against Napoleon I. For some years he assisted this cause personally and by gifts of money to the Spanish junta; and he was made a colonel of the Spanish service. On the restoration of the Spanish king Ferdinand and the

subversion of the constitution which the Spaniards had framed for themselves during their struggle for independence, Mr. Landor resigned his commission, and declared that though "willing to aid the Spanish people in the assertion of their liberties against the antagonist of Europe, he would have nothing to do with a perjurer and a traitor." In 1815, after the fall of Napoleon (having in the year 1811 married Julia Thuillier, of Bath, a lady of Swiss extraction), he removed to Italy, and purchased a mansion close to Florence, with estates in the neighbourhood. Here, with the exception of occasional tours, including some visits to England, he remained for more than thirty years; and here his family, of three sons and one daughter, still reside, Mr. Landor allowing them the possession of most of what remains of his once ample fortune, and retaining but little for himself.

The period of Mr. Landor's residence in Italy was the period of his greatest literary productiveness. In 1820 there appeared from the press of Pisa his Latin work entitled 'Idyllia Heroica,' with an appended Latin dissertation on the causes why recent Latin poets were so little read. In 1824-29 there was published in London in five volumes, that which is perhaps his greatest and most original work—his 'Imaginary Conversations of Literary Men and Statesmen.' Subsequent works were—a new edition of his 'Gebir, Count Julian, and other Poems,' in 1831; 'Letters of a Conservative, in which are shown the only means of saving what is left of the English Church,' 1836; 'A Satire on Satirists and Admonition to Detractors,' 1836; 'The Pentameron and Pentologue,' 1837; and 'Andrea of Hungary and Giovanni of Naples,' dramas, published in 1839. On the whole Mr. Landor's poetry was less appreciated than his prose. His 'Imaginary Conversations' from the first rivetted public attention by the novelty of their form, their masculine and yet rather singular English style, and the bold and often paradoxical nature of their opinions; and in virtue of this work alone, had he written nothing else, many would assign Mr. Landor one of the highest places among the English prose-writers of his age. Mr. Emerson, who visited Mr. Landor at Florence in 1833, gives an interesting description of him at that time, when he was yet in the prime of his strength, "I had inferred from his books," says Mr. Emerson, "or magnified from some anecdotes, an impression of Achillean wrath—an untameable petulance. I do not know whether the imputation was just or not, but certainly on this day his courtesy veiled that haughty mind, and he was the most patient and gentle of hosts. . . . He carries to its height the love of freak which the English delight to indulge, as if to signalise their commanding freedom. He has a wonderful brain, despotic, violent, inexhaustible, meant for a soldier, by what chance converted to letters, in which there is not a style nor a tint not known to him, yet with an English appetite for action and heroes."

During the last few years, Mr. Landor, who had almost become a naturalised Italian, has resided in England—chiefly at Bath. Here he takes a vehement interest in whatever goes on abroad; and frequently pens powerful letters or pungent epigrams on topics of foreign politics. Hating tyranny in every shape, he has more than once declared himself through the press a believer in the old Roman doctrine of tyrannicide. But it is not merely in casual communications to the newspapers that he has expressed the thoughts and feelings of his observant and still impassioned old age. The following works, some political and others literary, have proceeded from his pen during the last ten years:—"The Hellenica, enlarged and completed," 1847; "Imaginary Conversation of King Carlo Alberto and the Duchess Belgioioso on the Affairs and Prospects of Italy," 1848; "Poemata et Inscriptiones," a new and enlarged edition, 1847; "Popery, British and Foreign," 1851; "The Last Fruit off an Old Tree," 1853; and "Letters of an American" (published under the pseudonym of Pottinger), 1854. Mr. Landor still survives among us, a wonderful literary veteran, in his eighty-second year.

LANDSEER, JOHN, Associate Engraver of the Royal Academy, was born at Lincoln in 1769. He learnt engraving under Byrne, a landscape-engraver of much ability; as early as 1793 acquired some celebrity by engraving some vignettes, after Louthembourg, for Maclise's Bible; and increased his reputation by engravings executed for Bowyer's 'History of England' and Moore's 'Views in Scotland.' Mr. Landseer also published an excellent series of engravings of animals from the works of Rubens, Snyders, Gilpin, and other eminent artists. In 1806 Mr. Landseer delivered a course of lectures on engraving at the Royal Institution, which were published in the following year, and excited some discussion in the profession on account of some peculiar views promulgated in them. In the same year he was elected an Associate Engraver in the Royal Academy. The subordinate position assigned to engravers in the Academy—they not being admitted under any circumstances into full membership—was the source of considerable ill-feeling among engravers, and the post of associate engraver had been refused by several eminent engravers when Mr. Landseer accepted it. He announced however that he had only done so in the hope of being able to labour at a greater advantage in striving to remove the obnoxious restriction. Accordingly he memorialised the president and council on the subject, but after a year or two of correspondence and controversy the claim was rejected. Landseer's mortification is said to have been so great as to have disgusted him in a great measure with his profession itself, but, whether this be so or not, he appears from this time to have engraved comparatively little. The literary tastes

however which lecturing and controversy had aroused, he seems to have cultivated. Delighting in controversy, he started an art periodical, which soon died; and one he set on foot long after to counteract the mild influence of the 'Art Journal,' under the title of 'The Probe,' soon shared a like fate. He published likewise, at various times, several pamphlets and letters. In 1817 he communicated to the Society of Antiquaries a paper on 'Engraved Gems brought from Babylon,' which was printed in the 'Archæologia,' vol. xviii. Although possessing little of the requisite learning or mental training for the successful prosecution of such a subject, he continued to follow the game thus started; and after having delivered a course of lectures on 'Engraved Hieroglyphics' at the Royal Institution, he in 1823 published an elaborate volume entitled 'Sassan Researches.' This was followed in 1834 by a gossiping volume called 'A Descriptive, Explanatory, and Critical Catalogue of the Earliest Pictures in the National Gallery,' which, though of no more value aesthetically than his previous works were archaeologically, is yet in its discursiveness a somewhat amusing volume. But it is rather as the father of Edwin Landseer than on his own account that Mr. John Landseer will be remembered; and it is noteworthy that one of his best engravings, the 'Dogs of Mount St. Bernard,' is from one of Edwin Landseer's earliest pictures. Mr. Landseer died on the 29th of February 1852 in his eighty-third year, leaving three sons, all of whom have won an honourable, and one a pre-eminent, place in the history of English art.

* THOMAS LANDSEER, the eldest son of John Landseer, adopted his father's profession, but practised mezzotint in place of line-engraving. He is best known by his engravings of his brother Edwin's pictures, many of which are executed in a broad and painter-like style, and with great mastery over the scraper. He has also executed a good deal with the etching-needle, and a series of etchings of monkeys from his own drawings, published under the title of 'Monkeyana,' had considerable popularity. Mr. Landseer is at present engaged on a large engraving of Rosa Bonheur's famous 'Horse-Fair,' a work which affords peculiar facilities for the display of his characteristic excellences as an engraver.

* CHARLES LANDSEER, R.A., was dedicated, like his brother, to the service of art. Along with Thomas he became a pupil of Haydon, by whom he was regarded with much interest, and his progress used to be regularly chronicled in the pages of Elmes's 'Annals of the Fine Arts.' From the first Mr. Charles Landseer held a respectable position as a painter. Well instructed in the technicalities of his profession, a good colourist, careful in composition, and correct in costume, his pictures, illustrative of domestic history and the popular poets and novelists, have always had a fair share of popularity, without attaining any very eminent success. He was elected an Associate of the Royal Academy in 1837, Academician in 1845, and Keeper in 1851.

* LANDSEER, SIR EDWIN, R.A., like his brothers Thomas and Charles, was trained from childhood with a view to his becoming an artist; and he very early displayed extraordinary skill in drawing and facility in seizing the characteristic features of the object he was set to imitate. The direction of his education in art was undertaken by his father, who, as soon as the boy was able to use his pencil with some readiness, used to carry him out into the fields or on to Hampstead Heath—his first academy—and make him sketch the sheep, goats, or donkeys, as they were grazing there at liberty, instead of copying a print, or drawing from a plaster model. A similar plan was followed when he began to use his colours, and the consequence was that, while a mere boy, Edwin Landseer was able to paint directly from nature with the readiness and precision of an experienced artist. Indeed he had hardly emerged from boyhood when we find him asserting and making good his claim to a place among the artists of his day. Even at the age of fourteen he exhibited portraits and sketches of terriers, spaniels, a puppy, a horse and cat, &c.; and at the Exhibition in Spring Gardens in 1819, when Edwin Landseer was only sixteen, he had a picture entitled 'Dogs Fighting,' which attracted very general attention: it was purchased by Sir George Beaumont, then the acknowledged head of the patrons and connoisseurs of art in England, and proposals were at once issued by his father for engraving it. Before the public interest had time to abate, it was announced in the art periodicals of the day by Mr. Landseer, senior—who was indefatigable in setting forth his son's abilities—that Edwin Landseer had an "exquisite picture on hand for the next exhibition of the British Institution, the best he has painted, and by far the most interesting; it is two Mount St. Gothard mastiffs discovering a poor traveller half-buried in the snow;" and the announcement, after expatiating on its merits, concludes—"the subject is very touching, and we have not the slightest doubt of its making a great impression." When exhibited the picture did make a great impression, and the engraving from it—the best Landseer's father ever executed—was extremely popular.

Of such success at so early an age—for the young painter was only in his eighteenth year when he painted his 'Dogs of St. Gothard'—we know of no other example in the biography of English artists; and it is noticeable that it was attained almost exactly in the way and by the means through which his latest triumphs have been achieved—the expression of sentiment in animals. It might well have been feared that such early success would have the effect of rendering the young artist impatient of further study, and that his fate would be that which so often befalls precocious talent; but happily no such ill-consequence ensued. Edwin Landseer, we believe, never became properly

a pupil of Haydon, like his brothers, but he for a time looked chiefly to him for advice, and under his guidance completed a course of anatomical investigation, his 'subjects' however consisting of animal instead of human bodies; and under him he also made studies from the Elgin marbles. He likewise drew in the schools of the Royal Academy.

It was owing to the suggestion of Haydon that about this time (1820) he availed himself of the opportunity afforded by the death of a lion at one of the London menageries to make a number of careful drawings and dissections of that animal, and the result appeared in a series of pictures entitled 'A Lion Disturbed,' 'A Lion Prowling,' 'A Lion Reposing,' &c.; yet though these were much admired, we do not recollect his returning to his leonine studies till more than twenty years later, when the Duke of Wellington commissioned him to paint 'Van Amburgh and his Lions' (1847), which, though one of his largest, was by no means one of his best pictures. The earlier paintings of Landseer, while sufficiently free from any pettyness of manner, were characterised by extreme carefulness in all the details; the first approach to a broader and more masculine style of execution seems to have followed a visit to the Highlands, which had a decided influence on his method of execution and choice of subjects. His acquaintance with the grander features of nature appeared to impart largeness of view; though his election as Associate of the Royal Academy about the same time (1827, the earliest period at which, according to the laws of that institution, his election could take place) may have served to strengthen his self-reliance: he became R.A. in 1830. The first of his Highland subjects, 'The Return from Deer-Stalking,' appeared in 1827. From that time nearly every exhibition of the Royal Academy afforded him a new triumph. Among the most attractive of his subsequent works may be noted—'The Illicit Whiskey-Still' (1829); 'Highland Music' (1830), now one of the gems of the Vernon collection; and a poetic rendering of the incident of the dog watching beside his master's corpse on Helvellyn, which Wordsworth and Rogers have immortalised in verse. 'Poachers Deer-Stalking' appeared in 1831; and in 1833 'The Jack in Office,' one of the earliest works in which he showed how rich a vein of humour lay concealed under canine habits and physiognomy, and which he more amply displayed in his 'Laying Down the Law' (1840), and 'High Life' and 'Low Life,' now in the Vernon Gallery. To 1833 also belonged his clever picture of 'Sir Walter Scott and his Dogs'; and the next year saw one of the most popular of his pictures, 'Bolton Abbey in the Olden Time,' which, though it has a somewhat artificial air in the engravings, and perhaps would hardly appear to advantage in a public gallery, as it hangs in its splendid domicile at Chatsworth wins general admiration. 'A Scene in the Grampians—the Drover's Departure,' one of Landseer's most important works, and well known by the admirable line-engraving by Watts, appeared in 1835. In 1837 was exhibited the 'Return from Hawking,' and a smaller but far more beautiful work—one of those which bears the unmistakable impress of genius—'The Old Shepherd's Chief Mourner'—a sleep-dog watching by his master's coffin. The next year (1838) was especially rich in important works, it including the finest portrait ever painted of a Newfoundland dog, 'A Distinguished Member of the Humane Society,' 'The Life's in the Old Dog yet,' and one of the most striking of his unrivalled representations of the red-deer—'None but the Brave deserve the Fair.' 'Laying Down the Law,' appeared in 1840; 'Otter and Salmon,' and the 'Highland Shepherd's Home,' in 1842; 'The Otter Speared,' and 'Coming Events cast their Shadows before them,' in 1844; the 'Shepherd's Prayer,' in 1845; 'Peace,' 'War' (two of the leading pictures in the Vernon Gallery), and a 'Stag at Bay,' in 1846; 'The Drive—Shooting Deer on the Pass,' 1847; a picture of singular pathos—'The Random Shot,' and a most characteristic portrait of 'My Father,' in 1848; 'The Forester's Family,' and an 'Evening Scene in the Highlands,' in 1849; 'A Dialogue at Waterloo' in 1850; 'A Scene from the Midsummer Night's Dream' (another of his most original productions), in 1851; 'Night' and 'Morning'—a stag fight with its fatal result—and another marvellous Highland scene, 'The Children of the Mist,' 1853; 'Royal Sports on Hill and Dale' (a royal commission), 1854; and 'Saved,' a wondrous specimen of executive skill, and 'Highland Nurses'—Dedicated to Miss Nightingale,' in 1856. Of the shoals of mere portraits of dogs, horses, children, and macaws, it is unnecessary to take notice.

Sir Edwin Landseer is unquestionably the greatest modern painter of animals. In many respects he is unsurpassed, if equalled, by the painters of any time. His executive skill approaches as nearly as possible to perfection. Alone almost among the living painters of Europe, his works suggest no thought of paint or pencil. Precisely the effect he intended always appears to be produced, and that without effort or misadventure. Whatever be the animal he depicts, its form and colour—the exact degree of roughness, smoothness, or softness of its covering—its age—its savage or courtly training—all are rendered with unmistakable fidelity; and it is done in the simplest, most direct, and wholly unexaggerated manner. Nor is this executive mastery attained by constantly repeating the same range of animals and attitudes. His variety, on the contrary, is as remarkable as his facility; and both are evidently the result of long-continued and familiar observation. And further, he for the first time has shown of what a wonderful range of expression the animal physiognomy is capable. Every dog, and every deer, has its own character and its own expression; and sadness, misery, satisfaction, and drollery, the passions

and the feelings, the hopes and the fears, are shown to belong as much almost to the countenance of a dog as of a man. Sentiment and pathos were never before so evoked by representations of animal nature, probably never even quiet humour, or sharp satire; and the accompaniments are almost invariably as admirably painted as are the animals, though of course never so rendered as to imperil their supremacy. Highland scenery, for example, though only subordinate to the stags and dogs, to our thinking has never been so grandly characterised as by Landseer's pencil. But there are limits to every man's achievements, and Landseer is no exception. In none of his works has he called forth the higher powers of imagination. While in technical knowledge and executive skill he has never been surpassed, it may fairly be questioned whether he has ever painted animals in a manner requiring such an exercise of mind as those painted by Titian, Rubens, and Snyders. Even the more serious technical difficulties he has evaded. An instance probably can hardly be pointed out in which he has represented an animal fairly in motion, and certainly none in violent action as Snyders loved to paint them, or in the full tide of enjoyment as we may see them represented by Rubens. Occasionally Landseer advances so far as to depict the moment of an arrested action or struggle as in the instance of his stag-fights; or where a position can be for a time fixed, as with the dogs pawing up about the keeper who has spared the otter; but beyond that he does not venture. Reflecting upon the capabilities of art, we feel that Landseer, with his marvellous executive skill and great mental vigour, might have done much greater things than he has accomplished; but looking over what he has effected, we cannot but feel that he is not only one of the chief ornaments of the English school of painting, but that he must take rank, in his own walk, among the great painters of every age and country.

Beyond probably every other painter of any country has Sir Edwin Landseer been fortunate in the number of his works which have been engraved during his lifetime. It would be impossible to give a list of them, hardly one of his more important pictures having failed to find an engraver either in line or mezzotint, while some (like his 'Bolton Abbey') have been engraved more than once. Sir Edwin has himself also etched a few of his sketches, and made a few lithographic copies of others; and, having mentioned his sketches, we may add, that whether executed in colours or with the crayon, his original sketches are almost unrivalled for spirit and vigour. Nor ought we to omit to mention that, though he did not pursue the art far, a few trial pictures he executed in fresco showed that he possessed full mastery over that somewhat intractable material. It only remains to add, as a proof that the ability of Sir Edwin Landseer is recognised beyond the limits of his own country, that at the Exposition Universelle of 1856 a 'large gold medal' was awarded to him, being the only instance in which a medal of that class was given to an English artist.

There is of course no work of Sir Edwin Landseer's in our National Gallery; but the Vernon collection fortunately possesses several of the more excellent of his smaller pictures—'Peace' and 'War,' 'High Life' and 'Low Life,' 'Highland Music,' 'Spaniels of King Charles II.' (a common-place portrait piece), and 'The Dying Stag.'

LANFRANC, Archbishop of Canterbury, was born in 1005 at Pavia, where he was instructed in grammar and logic. After the death of his father, who was a counsellor to the senate of that town, he spent some years in the study of rhetoric and civil law at Bologna, whence he returned to his native city, and commenced as advocate in the courts of law. Thinking this too narrow a sphere, he removed into France, and opened a school at Avranches, which was soon crowded with students of high rank. In a journey to Rouen he had the misfortune to be robbed and left bound in a wood, where he was found the next morning by some peasants, who carried him almost dead to the abbey of Bec. Here he was treated with so much tenderness, that when he recovered he became a monk in that abbey (1041). At the end of three years he was chosen prior of Bec. Here he entered into a long and violent controversy with Berenger, archdeacon of Angers and master of the academy of Tours, on the subject of the Eucharist, which at that day made no little noise in the church. His fame ultimately procured him the favour of his sovereign, William duke of Normandy, who made him one of his counsellors, employed him in an important embassy to the pope, and appointed him, in 1062, abbot of his newly-erected monastery of St. Stephen at Caen. Here he established a new academy, which became no less famous than those which he had before set up at Avranches and Bec. When the see of Canterbury became vacant by the deposition of Stigand, William, who had effected the conquest of England, procured his election to that see, August 15, 1070, and with some difficulty prevailed upon him to accept the station. To the church of Canterbury he proved a great benefactor, by asserting its right to the primacy of England, by recovering many of its possessions, and by rebuilding the cathedral. During a large portion of the reign of William the Conqueror, Lanfranc enjoyed a high degree of favour; and his firmness and prudence secured the easy accession of William Rufus. During the short remainder of his life, Lanfranc had the chief direction of affairs, both in church and state. He died May 28, 1089, in the eighty-fourth year of his age.

Several of our historians who were almost his contemporaries speak in very advantageous terms of the genius and erudition of Lanfranc; and some of them, who were personally acquainted with him, repre-

sent him as the most learned man of his age. His writings consist of commentaries on St. Paul's Epistles, sermons, letters, and his treatise on the Eucharist against Berenger. This last production rendered him a prodigious favourite with the literary historians of the Church of Rome. His works were collected and edited by Lucas d'Achery, at Paris, folio, 1643.

LANGBAINE, GERARD, D.D., born in Westmorland about 1608, was successively a servitor, scholar, and fellow of Queen's College, Oxford, and he held the places of keeper of archives to the university and provost of his college for a good many years before his death, which happened in 1658. He was a studious and timid man, who contrived to steer through the political storms of his time without giving serious offence to any party. He edited Longinus, and published several works of his own, chiefly on church questions. But his chief usefulness was in his unprinted collections, which included several catalogues of manuscripts, often referred to by Warton and others.

GERARD LANGBAINE, his son, was born at Oxford in 1656, and after having received an elementary education, was apprenticed to a bookseller in London. An elder brother dying, he was recalled home, and entered in 1672 a gentleman commoner of University College. He betook himself however to idleness and low extravagance, and spent a great part of his property; but after a time he reformed, and retained of his earlier tastes none but his love for the theatres. He made a very large collection of old plays, amounting, as he says, to almost a thousand. He made use of these, first, in a republication of a catalogue of plays made by Kirkman, a bookseller, which appeared under the title of 'Momus Triumphans,' 4to, 1687. This work, speedily sold off, was improved into 'A New Catalogue of English Plays,' 4to, 1688. Still further additions and amendments produced his 'Account of the English Dramatick Poets,' 8vo, 1691 (1699 by Gildon, 1719 by Giles Jacob, for Curl). The criticism contained in this work is shallow, prejudiced, and obsequious. The author pronounces Sir Robert Howard to be an admirable poet, and prefers Shadwell's plays to Dryden's. But in relating facts and describing editions, he scrupulously sets down what was before him; and although the information he gives is very incomplete, his work is the most trustworthy of our catalogues of the kind, and has been of very great service. In the British Museum is a copy of it with valuable notes by Oldys. He published also an appendix to a catalogue of graduates.

LANGELANDE, ROBERT. [LONGLAND.]

LANGHORNE, JOHN, was born at Kirkby Stephen, in Westmorland, in 1735, and educated at the school of Appleby. Being too indigent to proceed to the university, he had recourse to private tuition, took orders, and in 1760 entered himself as a ten-year-man at Clare Hall, Cambridge. Having fallen in love with a daughter of the gentleman in whose family he lived, he offered her his hand, and on being refused quitted his employment, and repaired to London, where he obtained a curacy, helped to support himself by his pen, and soon became a well-known and popular author. Dr. Hurd appointed him assistant preacher of Lincoln's Inn Fields; and a short poem, called 'Genius and Valour,' written in defence of the Scotch against the coarse abuse of Churchill and others, procured for him, from the University of Edinburgh in 1766, the degree of D.D. In the following year he renewed his suit, and was accepted. The living of Blagden in Somersetshire was purchased for him; but in the first year of his marriage his happiness was interrupted by the death of his wife in childbed. To solace his grief he undertook, with his brother, the new translation of Plutarch's 'Lives,' published in 1771, by which he is best known. In accuracy this has the advantage over Sir Thomas North's old version from the French of Amyot, but it is much inferior in spirit and effect. Having married again, he lost his second wife in 1776, also in childbed. This double disappointment is said to have led him into intemperate habits. He died in April 1779.

Langhorne wrote tales, poems (chiefly short), and sermons, which did not establish for him much reputation as a divine. His prose is flowery and sentimental, his verses pleasing and harmonious but over ornamented, seldom rising above prettiness, and often spoiled by affectation. They have a place in Chalmers's 'British Poets.' His 'Poems,' published by his son in 1802, contain a Life of the author.

LANGTOFT, PETER, an English chronicler who lived at the end of the 13th and beginning of the 14th century, was a canon-regular of the order of St. Austin at Bridlington in Yorkshire. He translated from the Latin into French verse Herbert Bosenham's (or Boscama's) 'Life of Thomas à Becket,' and compiled, likewise in French verse, a 'Chronicle of England,' manuscripts of which are preserved in the Cottonian Collection, Julius A.V., in the old Royal Library at the British Museum, and among the Arundel manuscripts in the library of Heralds' College. The 'Chronicle' begins with the fable of the Trojans, and comes down to the end of the reign of Edward I. Langtoft is believed to have died early in the reign of Edward II. Robert de Brunne gave an English metrical version of Langtoft, which was edited at Oxford, in 2 vols. 8vo, by Hearne, in 1725.

LANGTON, STEPHEN, Cardinal of St. Chrysogonus, and Archbishop of Canterbury, was born in the earlier half of the 12th century, according to one account in Lincolnshire, according to another in Devonshire. After finishing his studies at the University of Paris, he taught with applause in that seminary, and gradually

rose to the office of its chancellor. He held this rank, and had also obtained some preferment in the Church of his native country, when he visited Rome, about the year 1206, on the invitation of Pope Innocent III., who immediately honoured him with the purple by the title of Cardinal of St. Chrysogonus, and soon after recommended him to be elected to the archbishopric of Canterbury, then considered as vacant by the rejection of the claims both of Reginald the sub-prior of Christchurch, whom his brother monks had in the first instance appointed to succeed the last archbishop Hubert, and of John de Gray, bishop of Norwich, whom they had afterwards substituted in deference to the commands of King John. Langton was elected by a few of the monks who were then at Rome, and was consecrated by Innocent at Viterbo, on the 17th of June 1207. John's determined resistance to this nomination gave rise to the contest between him and the pontiff which had such important results. [INNOCENT III.; JOHN, King of England.] The consequence, in so far as Langton was concerned, was, that he was kept out of his see for about six years; till at last, after the negotiation concluded by the legate Pandulf, John and the cardinal met at Winchester in July 1213, and the latter was fully acknowledged as archbishop. In the close union however that now followed between John and Innocent, Langton, finding his own interests and those of the clergy in general, in so far as they were opposed to those of the king, disregarded by the pope, joined the confederacy of the insurgent barons, among whom the eminence of his station and the ascendancy of his talents soon acquired him a high influence, and in whose counsels he took a prominent part. It was he who, at the meeting of the heads of the revolt at London on the 25th of August 1213, suggested the demand for a renewal of the charter of Henry I. To the cause of the national liberties, which he had thus joined, he adhered without swerving throughout the rest of the contest; a course by which he so greatly offended the pope, that on his refusal to excommunicate the opponents of the royal authority, after John's perfidious attempt to release himself from his engagements at Runnymede, he was in the latter part of the year 1215 suspended by Innocent from the exercise of his archiepiscopal functions. After this the name of Cardinal Langton is little mentioned by the historians; but he continued to preside over the Church till his death, 9th of July 1228. He was a person of considerable learning, and is the author of various theological tracts, some of which have been printed, and lists of all of which that are known are given by Cave and Tanner. It has been shown in a note to Warton's 'History of English Poetry' (edition of 1840, ii. p. 28), that there is no reason to suppose Langton to have been the author of a drama in the French language, which had been assigned to him by M. de la Rue (in the 'Archæologia,' vol. xiv.) on no better grounds than the manuscript having been found bound up with one of the cardinal's sermons.

LANIERE, NICOLAS, a painter, engraver, and musician, was born in 1668, and was an Italian by birth. He was a favourite with Charles I., who employed him in the purchase of pictures. Walpole supposes that he was employed in the purchase of the gallery of the Duke of Mantua, for which Charles gave 20,000*l.*, and which comprised the 'Triumph of Cæsar,' by Mantegna, now at Hampton Court.

Laniere was a better musician than a painter. He was appointed in 1626 Charles's chapel-master, for which he had a salary of 200*l.* per annum; he was also closet-keeper to Charles. There is in Ben Jonson's works a masque, which was performed in 1617 at the house of Lord Hay for the entertainment of the French ambassador, and for which Laniere both painted the scenes and composed the music. Laniere is also said to have set to music the hymn which was written by Thomas Pierce for the funeral dirge of Charles I., but it was probably another person of the same name.

Laniere lived to see the dispersion of the collection which he himself had been mainly instrumental in forming. He purchased four pictures at the sale of Charles's effects for 230*l.*; others were purchased by his brothers Jerome and Clement. Laniere appears to have been a general dealer in pictures, and, according to Sanderson ('Graphicæ,' p. 16), to have been not over-scrupulous, for that writer accuses him of passing copies as originals: the colours he is asserted to have obscured by soot, and he cracked the pictures by rolling them up face inwards. Laniere purchased many pictures for Charles, and marked them with a rosette or a small figure resembling six radiating leaves: the mark is given by Walpole. Walpole gives the ordinary statement that Laniere was buried on the 4th of November 1646, overlooking the somewhat glaring inconsistency of having made him write the music to Charles's funeral dirge three years after his own burial: the date is not a misprint, because Walpole adds his age—seventy-eight years. The date of Laniere's birth (1668) is correct, because in an engraving dated 1636 he writes himself at the juvenile age of sixty-eight—"à l'età sua giovanile di sessanta-otto anni." But, as already indicated, the probability is that two persons of the same name have been confounded; and the second Laniere was probably a relative and successor of the first, both as a picture-dealer and a musician. Pepys notices in his 'Diary,' under October 27, 1665, that "among other things, Laniere did at the request of Mr. Hill bring two or three of the finest prints for my wife to see that ever I did see in all my life;" and he further mentions several times in that and the

following year Lanieri having taken part in his musical parties. Now as the Lanieri who forms the subject of this notice would have been then ninety-eight years old he could hardly be the person referred to. Lord Braybrooke, in a note to Pepys (under the above date), says that "the letters patent under which the Society of Musicians were incorporated at the Restoration, mentions Nicolas Lanieri as first marshal, and four others of his name as wardens or assistants of the company," and this was most likely the Nicolas Lanieri who composed the notes to Pierce's hymn. Vandyck painted Lanieri's portrait during his first visit to England, and it was this picture which induced Charles I. to request Sir Kenelm Digby to invite Vandyck back again after his departure. There is a portrait of Lanieri by himself in the Music School at Oxford, with palette and brushes in his hands, and some music-notes on a piece of paper.

*LANKESTER, EDWIN, M.D., distinguished as a writer and lecturer, chiefly on subjects of natural science, was born at Milton, near Woodbridge, Suffolk, in 1814. He was educated at Woodbridge, was apprenticed there to a surgeon, and afterwards studied at University College, London, from 1834 to 1837, having the advantage of pursuing botany under Professor Lindley, and comparative anatomy under Professor Grant. Having become a member of the College of Surgeons and of the Apothecaries' Society, he visited the Continent, and graduated at Heidelberg. In 1841 he was chosen a Licentiate of the College of Physicians. Before this period Dr. Lankester was known as a writer on subjects of medicine and natural history; and he has since contributed many valuable papers to various scientific journals. He was a writer on botanical subjects in 'The Penny Cyclopædia'; and by him, as editor of the Division of Natural History of 'The English Cyclopædia,' the various articles of 'The Penny Cyclopædia' were brought into a more systematic shape, and the most recent information communicated in very large additions to the original work. Dr. Lankester is a Fellow of the Royal Society and of the Linnæan Society, Secretary to the Ray Society, and Professor of Natural History at New College, London.

LANNES, JEAN, Duke of Montebello and Marshal of France, was born at Lectoure in Guienne, on the 11th of April 1769. He was born of humble parents, and was at first brought up to the trade of a dyer, which he quitted in 1792 to join a battalion of volunteers raised in the department of Gers, of which he soon became serjeant-major. His first campaign was with the army employed on the frontiers of the Pyrenees, where his resolute character and soldier-like deportment obtained him a great ascendancy over his comrades. His military talents were soon discovered and appreciated, and by the suffrages of the army he rose so rapidly in command, that at the close of the year 1793 he had attained the rank of 'chef de brigade,' which nearly corresponds to that of major among the English troops. After the political crisis of the 9th Thermidor (July 27th) 1794, he partook in the disgrace of the Generals Bonaparte and Massena on account of their connection with the younger Robespierre; he then retired to Paris, where he formed an acquaintance with those two distinguished commanders, whose future glories he was destined to share. His calm and daring character especially attracted the notice of Bonaparte, who employed him in the affair of the Sections [BONAPARTE], and he afterwards with him joined the army of Italy. After the victories of Montenotte and Millesimo, April 26th 1796, where he greatly distinguished himself, Lannes was made colonel of the thirty-second demi-brigade. Among his many daring exploits in this celebrated campaign, at the crossing of the river Po he was the first with a few grenadiers to arrive at the opposite bank; and likewise, on the bridge of Lodi, he was foremost in effecting the perilous passage. In 1797 he became general of brigade, in which capacity he served with distinction till the signing of the treaty of Campo Formio. He afterwards formed part of the expedition to Egypt, where he rose to the rank of a general of division, and maintained his high reputation. He greatly contributed to the victory gained by the French at Aboukir, and was dangerously wounded at the siege of Acre.

When Bonaparte determined upon leaving Egypt, Lannes was one of the generals chosen to accompany him to France [BONAPARTE; KLEBER], where he rendered him material assistance in the revolution of the 18th Brumaire (November 9th) 1799, and as a recompense for his services on that occasion he was named commander of the Consular guard. He was afterwards employed in the south of France, at the head of the ninth and tenth military divisions, to suppress the insurgent Jacobins. From thence he was recalled by the First Consul, in the year 1800, to join the expedition to Italy, and he shared the dangers and labour which the French army underwent in crossing the Great St. Bernard. In this passage Lannes commanded the advanced guard, and on the 17th of May he arrived at Châtillon, where he attacked and defeated a corps of 5000 Austrians. On the 12th of June was fought the important battle of Montebello, in which the Austrians were signally defeated, and 5000 prisoners and six pieces of cannon were taken. The impression made on the mind of Napoleon of Lannes' skill and courage on this occasion was so great, that, some years afterwards, Montebello was the title chosen for the dukedom to which he was raised. After the battle of Marengo, in which he likewise greatly distinguished himself, he received a sabre of honour, and was selected to present to the government at Paris the standards that had been taken from the Austrians.

In 1801 he was sent to Lisbon by the First Consul in the capacity of minister-plenipotentiary of France; and his determined bearing obtained from the feeble government of Portugal every measure which Napoleon I. at that time required. Several characteristic traits of General Lannes' behaviour at the court of Lisbon are to be found in the interesting Memoirs of the Duchess of Abrantes (Madame Junot), whose husband was sent to supersede him as ambassador. On his return from Portugal in 1804, Napoleon, who was now emperor, created him Marshal of the Empire, and afterwards Duke of Montebello. In the Austrian campaign of 1805 Lannes was appointed to the chief command of the left wing of the French army, and was present at the battle of Wertingen, and at the taking of Braunau (October 29th 1805). In the decisive battle of Austerlitz, December 2nd 1805, where he manifested his usual courage and gave proof of increased skill and judgment, he had two of his aides-de-camp killed by his side.

In the Prussian campaign of 1806 and 1807 he performed many brilliant achievements; at the siege of Danzig he rendered, together with Oudinot, material assistance to Marshal Lefebvre, who commanded the besieging army, and he narrowly escaped death at the battle of Jena. [LEFEBVRE] In June 1807, a few months subsequent to the battle of Eylau, an unsuccessful attempt was made by Lannes upon the intrenched camp of Heilberg, and it occasioned a serious dispute between him and the Grand Duke of Berg (Murat), which gave rise to an incident showing the freedom with which he was accustomed to address Napoleon, whom, on this occasion, he openly accused of manifesting an undue partiality to his brother-in-law. The scene of bitter altercation between the emperor and his lieutenant is described with dramatic effect by the Duchess of Abrantes ('Mém.,' ix. 369-72). In 1808 Lannes accompanied Napoleon in the Peninsular campaign, and had the command of the third corps of the army. In crossing the mountains near Mon Dragon he met with an accident which might have proved fatal but for the skill of that eminent surgeon Baron Larrey. In the battle of Tudela (November 23rd, 1808), at which Lannes was present, the Spaniards under Castaños were completely defeated, and seven standards, thirty pieces of cannon, and upwards of three thousand prisoners fell into the hands of the French. Lannes was afterwards appointed to the chief command of the army besieging Saragossa, and it was there especially that the influence of his military talents was felt and appreciated. For fifty days without intermission the French army had fruitlessly fought and laboured; he found the soldiers suffering from privations of every kind and deeply dispirited. On the 21st of February 1809, the city was entered by a general assault, and from twelve to fifteen thousand of its courageous defenders, who were reduced to the lowest state of weakness by the sufferings and privations they had endured, laid down their arms. After the fall of Saragossa, Lannes returned to France, with the intention of spending some time upon his estate in the neighbourhood of Paris, but after a few weeks the second war with Austria broke out, and he was again called to share the fortune of his master on the field of battle.

In this campaign he had the command of the second corps of Napoleon's army, composed of fifty thousand men. At the battle of Eckmühl, April 22nd, 1809, his services proved of the greatest value. It was the intention of the French emperor to cut off the communications of the Austrians with the Isar and the Inn, and, by throwing them back upon Bohemia, to prevent them from defending Vienna. For this purpose he commenced the attack by advancing the right wing of his army under Lannes, together with part of Davout's corps, to attack the Austrian left. This movement, which Lannes most skillfully conducted, was perfectly successful, and the enemy was driven back in confusion. His bravery also displayed itself in subsequent parts of this important battle, and he contributed greatly to the final issue, which was favourable to the French. The day after this engagement, in the assault on Ratisbon, Lannes, who conducted the operations, perceiving a large house which was situated against the ramparts of the town, caused several guns to play against it, and a breach was formed by which access might be gained to the summit. A heavy fire however was kept up from the ramparts, which rendered the crossing of the glacis extremely hazardous to the besiegers, and for some time no soldier could be found sufficiently bold to face the danger. The marshal at length, impatient at the delay, seized a scaling-ladder, and hastened forward through the thickest part of the shower of the enemy's balls. He was instantly followed by his men, whom the gallant spectacle of their leader's courage had animated, and, by this daring and decisive measure, the breach was quickly passed, and the town was gained.

The last but not least noble exploits of this distinguished general were the defence of the village of Esling, in the sanguinary battle which has been named from it, and the grand attack on the Austrian centre, which, though unsuccessful in its results, was conducted by Lannes with great skill and courage. When the French had been compelled to retire to the island of Lobau, their wearied bands were attacked by fresh troops, which the Archduke Charles brought up in constant succession in order to dislodge them from their position. Lannes, with the intention of resisting this attack, posted those of his soldiers on whom he could place most reliance in the rear of the columns, and supporting them with the troops which the emperor

had sent to his assistance, seconded by Masséna, he checked the advancing numbers of the Austrians. The French had reserved their fire till the enemy had approached within a few yards of them, and then commenced a most deadly struggle. At that critical moment Lannes had dismounted from his horse, that he might be less exposed to the sweeping fire of the Austrian artillery, when he was struck by a cannon-ball, which carried away the whole of his right leg and the foot and ankle of the left. Napoleon was directing the position of some batteries, when he beheld the almost lifeless body of his heroic marshal borne off from the battle. Even in the critical circumstances in which his army was then placed, and though the fate of his empire was depending on the issue, Napoleon turned aside to address a few words to the general whom of all his officers he most trusted. On no other occasion it is said was Napoleon seen to evince such deep emotion. For nine days Lannes lingered in the most agonising sufferings, during which he was constantly visited by the emperor, and on the 31st of May 1809, he expired.

Lannes, unlike many of Napoleon's generals, had acquired a constantly increasing military reputation. In the first part of his career courage predominated over judgment; but experience was daily producing in his mind a more just equilibrium between those two qualities so essential to a commander. "I found him a dwarf," said the emperor to Las Cases, "and I lost him a giant." And in another conversation with this faithful companion of his exile, he remarked of this marshal that "he had great experience in war, having been in fifty-four battles and three hundred combats. He was cool in the midst of fire; possessed of a clear penetrating eye, ready to take advantage of any opportunity which might present itself. Violent and hasty in his temper, even in my presence, he was however ardently attached to me." Lannes had married Mademoiselle Louise de Ghéneuec, a young woman of great beauty and prepossessing manners. When she became a widow, Napoleon evinced by the most assiduous attention to her the high respect he bore for the memory of her distinguished husband. She was afterwards appointed a lady of honour to the Empress Maria Louisa.

* LANSDOWNE, HENRY PETTY FITZ-MAURICE, THIRD MARQUIS OF, K.G., is the second, but only surviving son of the first Marquis, better known as the Earl of Shelburne, and was born July 2, 1780. Lord Henry Petty was sent to Westminster School; thence he was removed about the year 1795 to Edinburgh, where he was placed under the care and tuition of Dugald Stewart, in whose society his youthful mind became more deeply imbued than ever with liberal and enlightened views on history, politics, and philosophy. Here he strengthened his love not merely of constitutional government and freedom, but of modern literature and scientific pursuits—a taste which has added lustre to his social and private life, and has rendered his house for nearly half a century the resort and the home of the best literary society of the age. In the Speculative Society of the Northern Metropolis, in which Brougham, Horner, Jeffrey, Sidney Smith, and other liberal politicians of that day first sharpened their oratorical weapons, Lord Henry Petty also practised his skill in debate: and he is said to have been stamped from that early time, among his contemporaries, with the promise of becoming an able statesman and parliamentary leader. Having finished his course of studies at Edinburgh, he removed to Trinity College, Cambridge, where he graduated M.A. in 1801. Having travelled for a few months upon the Continent in company with Monsieur Dupont, he prepared to enter upon public life, and shortly after attaining his majority he was returned to Parliament by the influence of his father as member for the borough of Calne in Wiltshire. In the House of Commons some time elapsed before he attempted to distinguish himself as a debater. In 1804 however he made his first parliamentary speech upon an Irish question. The Tory party headed by Mr. Pitt were in power at the time, and under the operation of the Bank Restriction Act the Irish people were threatened with a serious calamity in consequence of the excessive issue of paper-money by the private banks of the country. Lord Henry Petty's speech on this occasion, delivered in opposition to the views of the ministry, was remarkable for the clearness and soundness of the views which he expressed upon the general economic bearings of the currency question, and the speaker unconsciously offered a tribute of respect to the memory of his ancestor Sir William Petty, who has been justly styled the 'father' of the science of political economy in this country. In the following year Lord Henry Petty confirmed his reputation as a parliamentary debater by his speech on the case of Lord Melville. In deference to the claims of party and private friendship, Mr. Pitt defended his colleague with great earnestness from the charge of official corruption, and he was answered with proportionate severity by Lord Henry Petty, whose honest and generous nature instinctively shrank from even the suspicion of political dishonesty or private peculation. The Prime Minister died within the year, and the Tory party being broken up by their leader's death, the Whigs came into office under Grenville and Fox, who nominated Lord Henry Petty Chancellor of the Exchequer in the place of Pitt, whom he also succeeded in the representation of the University of Cambridge. He now became a frequent speaker, more especially on subjects connected with finance; and had his party remained in office, he would probably have attained reputation as a minister. But the duration of Lord Grenville's ministry was scarcely sufficient to test Lord Henry Petty's abilities as

a financier; it was long enough however to satisfy the public that he was a statesman of no ordinary promise, and that he might fairly look forward hereafter to the filling of a higher position in the administration of the country. This promise, it is true, has not been realised to the letter; but on looking back over the history of the last half century, we find the name of the Marquis of Lansdowne—for so we must now style him, as he succeeded to the Peerage in 1809)—associated with all the leading measures of the liberal party; such, for example, as the Abolition of Slavery, which he advocated as early as 1807, and subsequently by specific motions in 1814 and 1821. It may be safely said that in both Houses of the Legislature no question was ever discussed involving the abolition of slavery and the slave trade, which has not received the support of his advocacy. He was also from the very first a warm and energetic advocate of the abolition of the penal laws against the Roman Catholics, and of the granting civil and religious emancipation to that body. Ever steady and earnest in this cause, some of Lord Lansdowne's best speeches were made on its behalf. It was on this question that Lord Grenville and his administration were compelled to retire from office in 1807. The Religious Test Bill introduced by Lord Howick proved a fatal blow to Lord Grenville and his friends; and it also resulted in the loss of Lord Henry Petty's seat for the University of Cambridge; for at the next general election he was left at the bottom of the poll: so strong were the feelings of that constituency against the removal of penal restrictions from the Roman Catholics. The subsequent political career of Lord Lansdowne is identified with that of the Whig party, over whose progress he has always exercised a moderating influence. In 1820 he anticipated the enlightened measures of a more recent day by a motion in favour of the principle of free trade both at home and abroad. In 1822 we find him engaged in bringing forward a motion for an inquiry into the suffering condition of Ireland and its causes; and in 1824 he strongly urged upon the ministry of Lord Liverpool the necessity of acknowledging the independence of the Brazilian Republics. After eighteen years exclusion from a share of the administration, Lord Lansdowne again took office in 1828 as Secretary of State for the Home Department under George Canning, and he also held the seals of the Foreign Office under the short-lived administration of his successor, Viscount Goderich, now Earl of Ripon. In this position he had scarcely time to develop his capacity in the wide range of foreign politics; but the impression which he left on the public mind was very favourable to his administrative abilities. Some of his best speeches however during this period touched not on foreign affairs, but on the question of Roman Catholic emancipation, in the final settlement of which measure he took a leading part. After remaining in the ranks of the opposition from 1829 to 1831, during the administration of the Duke of Wellington, Lord Lansdowne again took office under Earl Grey in the latter year, when he became President of the Council, a post in which his high character and extended experience rendered his assistance peculiarly valuable to his party. Having taken an active share in the passing of the Reform Act, the principle of which he had advocated during the whole course of his political life, he continued to hold the same post under the ministry of Lord Melbourne down to the retirement of that nobleman from office in 1841. On the accession of Sir Robert Peel in that year, Lord Lansdowne became the recognised leader of the opposition in the House of Lords, and in this position his dignity and courtesy conciliated the respect and esteem even of his opponents. In 1846 he resumed his office and his functions as leader of the House of Lords, under the administration of Lord John Russell. He resigned office together with that nobleman in 1852, accompanying his resignation with a speech of touching dignity, which will long be remembered as the appropriate farewell of one who had become the Nestor of the Upper House. Having remained in opposition through the brief administration of the Earl of Derby, he declined to assume the reins of office on Lord Derby's retirement in December 1852, though requested by her Majesty to take them; and has been contented to hold under the Earl of Aberdeen and Lord Palmerston a seat in the cabinet without office.

Lord Lansdowne married in 1808 a daughter of the second Earl of Ichester, by whom he has an only surviving son, Lord Shelburne, Under Secretary of State for Foreign Affairs, who has been recently summoned to the House of Lords in his father's barony as Lord Wycombe.

LANTIER, ÉTIENNE-FRANÇOIS DE, was born at Marseille, September 1, 1734. Although passionately attached to literature, Lantier did not appear as an author till 1778, when his comedy of the 'L'Impatient' was performed after having been retained in manuscript for three years. Notwithstanding the very sinister predictions of some of his friends, the piece had a decided success; and thus encouraged, Lantier published his 'Tales,' in prose and verse, which latter La Harpe pronounced to be inferior only to those of Voltaire and Lafontaine. He was admitted into the Academy of Marseille in 1786, and began collecting materials for his celebrated 'Voyages d'Antenor,' the idea of which had been suggested to him by a visit to Herculaneum. The success of this work, composed amid the storms of the revolution, was almost unprecedented. Some critics would fain have persuaded the public that this delightful production was merely a feeble imitation of Barthélemy's 'Anacharsis,' although Lantier had

purposely abstained from reading the latter work until he had completed his own. In fact, although resembling each other in their general scope, the two works are very dissimilar in character and style, and in their respective merits. One proof of its popularity is, that 'Antenor' has been translated into German, Italian, Spanish, Portuguese, Russian, and modern Greek. He afterwards produced two other fictitious narratives of travels, 'Les Voyageurs en Suisse,' and 'Le Voyage en Espagne,' both of which possess considerable interest; also his 'Correspondance de Césarine d'Arly,' a work captivating for the graces of its tone and style, and almost a literary prodigy when considered as the production of an octogenarian. Even ninety-one years had not extinguished his literary ardour, for at that very advanced age he composed a poem in eight cantos, entitled 'Geoffroy Rudel, ou le Troubadour.' He died at Marseille, where he had resided for the last twelve years, January 31, 1826, at the age of ninety-two.

* LANYON, CHARLES, civil engineer and architect, was born January 6, 1813, at Eastbourne, Sussex. He was articled to Mr. Jacob Owen (formerly of Portsmouth), architect and engineer to the board of Public Works, Dublin, one of whose daughters he afterwards married. Shortly after the expiration of his apprenticeship in the year 1833 he became a candidate for one of the county-surveyorships under the then new Grand Jury Act, and having taken one of the first places at the examination, was appointed to the county of Kildare. In the year 1836 he accepted the surveyorship of the county of Antrim, which presented a much more extensive field for the exercise of his profession.

This appointment he at present holds. Since his connection with this county he has laid out upwards of 300 miles of new road, and improved the leading lines of communication between all the towns in the county. The most remarkable of the new roads carried on under his superintendence is that known as the Antrim coast-road, extending from Carrickfergus to the Giants' Causeway and Portrush, a distance of about seventy miles, passing through the towns of Larne, Glenarm, Cushendall, Ballycastle, and Bushmills. This road (nearly the whole of which was laid out and executed by Mr. Lanyon) is much frequented by tourists on account of the great beauty of its scenery. Mr. Lanyon acted as engineer in chief to the Belfast, Carrickfergus, and Ballymena railway, opened in 1847; also to the Ballymena, Coleraine, and Portrush railway, opened in 1855; and to the Cookstown extension railway, opened in the present year.

As an architect Mr. Lanyon's practice has been very extensive. Among the principal public buildings which he designed and superintended are the following:—the new county courts at Belfast; the county jail, designed to accommodate upwards of 400 prisoners—the first prison built on the separate system in Ireland; the Queen's College, Belfast; the Ulster Institution for the education of the deaf and dumb and the blind; and the public offices at Belfast, comprising under one roof the custom-house, post-office, inland revenue, stamps, local marine, &c. He has also built upwards of twenty churches in the diocese of Down and Connor, and many important private residences in several of the midland and northern counties of Ireland. The campanile erected at Trinity College, Dublin, is also one of his works.

LANZI, LUIGI, an eminent modern Italian archaeologist and writer on art, was born in the Marca d'Ancona, on the 14th of June 1732. After receiving an excellent education at home, he entered the order of the Jesuits at the age of seventeen, and as soon as he had completed his own studies, which were directed chiefly to classical literature, distinguished himself as a zealous and able instructor of youth. Afflicting as the event was to him at the time, and it occasioned him a serious illness, the suppression of the order may be considered to have been a most fortunate one for Lanzi's reputation, since it threw him into a literary career which he would else probably not have entered. The first step towards it was his being appointed antiquary, or keeper of the cabinet of medals, at Florence, by the grand-duke Peter Leopold, April 17th 1776. One of his first literary productions was his 'Descrizione della Galleria,' which, greatly superior to the generality of productions of the same class, afforded proof of critical acumen and erudition. To this succeeded his dissertation on the sculpture of the ancients, entitled 'Notizie Preliminari,' &c., 1789, and the celebrated 'Saggio di Lingua Etrusca,' a work of extraordinary study and research, which throws considerable light on a very obscure and difficult branch of archaeology. Yet notwithstanding its intrinsic value it was from its nature calculated to interest only a small portion even of the learned world, and has therefore contributed less towards its author's fame with the European public than his 'Storia Pittorica.' This latter work, the first portion of which appeared in 1792, and to undertake which he had been excited by Tiraboschi, the historian of Italian literature, was the first attempt to give a comprehensive and continuous history of Italian painting arranged according to schools and epochs, and written in a tone of impartial criticism; whereas prior to its appearance the numerous particular histories and artistical biographies presented little better than a confused mass of materials, and conflicting prejudices and opinions. Lanzi's object was to characterise all the various schools, and the chief masters in each, and also the changes in regard to style and taste which each had undergone; while the utility of the work as a book of reference is greatly increased by three excellent indexes.

The work was received with general favour abroad as well as in Italy, and several editions were called for during the author's life. Each of these he carefully revised; the last which he superintended was published shortly before his death at Bassano, 1809, and was a much fuller as well as more correct work than the early editions. Hardly had its author completed the publication of the 'Storia Pittorica,' when the battle of Bassano, September 8th 1796, drove him from that city, and compelled him to seek an asylum in Treviso, and afterwards in Udine, where he remained till the latter part of 1801, when he returned to Florence, having been restored to his former appointment in the museum. Here he wrote his three dissertations on the so-called Etruscan vases, and made a collection of lapidary inscriptions, but suffering from repeated apoplectic attacks and the infirmities of age, it was not until earnestly pressed by Cardinal Zondadari, archbishop of Sienna, that he prevailed upon himself to publish the latter, adding to them his own Latin poems, which are remarkable for their purity and graces of style. In addition to the above, and one or two minor productions, Lanzi published a translation of Hesiod in terza rima, first undertaken by him in his youth, and carefully corrected and touched up by him from time to time. His death was occasioned by apoplexy, March 30, 1810. His 'Storia Pittorica' has been translated into various languages; the English version by Mr. Thomas Roscoe is a very good one; the last edition of it forms three volumes (1847) of Bohn's 'Standard Library.'

LAPLACE, PIERRE-SIMON. A life of Laplace can hold no middle place between a short account for the general reader, and a detailed description of his labours for the reference of those who read his works. Independently of the latter being too long for this work, we have a specific reason for avoiding it, which will appear in the course of this article: namely, that the writings of Laplace do not give specific information as to what was done by himself and what by others; and that no one has yet supplied the deficiency.

Pierre-Simon Laplace was born March 1749, at Beaumont-en-Auge, near Honfleur, and was the son of a farmer. He received a good education, and appears at first to have turned his attention to theology; but as early as the age of eighteen he went to Paris, having previously taught mathematics at his native place. He had letters of introduction to D'Alembert, but finding that they procured him no notice from that philosopher, he wrote him a letter on some elementary points of mechanics, with which D'Alembert was so much pleased that he sent for Laplace the same day, telling him that he had found a better way of calling attention to his claims than by letters of introduction. Shortly afterwards, in 1763 or 1769, the recommendation of D'Alembert procured for Laplace a chair of mathematics at the military school of Paris. In 1772 Laplace showed his powers in a paper on integration of equations of finite differences in the 'Memoirs of the Academy of Turin;' and from that time his scientific life was one achievement after another, until he attained a reputation almost Newtonian with the world at large, and of the highest extent and character among mathematicians, who, though they cannot even compare walks of so different a kind as those of Newton and Laplace, feel that the latter must be named next after Lagrange, and the two together above all the followers of the first.

The political life of Laplace was not so favourably distinguished. In 1799 the First Consul made him minister of the interior. With the views which Napoleon always professed with respect to science, it is not wonderful that he should have made the experiment of trying to strengthen his administration by the assistance of a philosopher whose rising fame made the French expect to claim a name which should rival that of Newton. But the experiment was not successful; and after a very short period the First Consul removed Laplace to the head of the sénat conservateur. The subsequent account given by Napoleon of his minister will be a part of the biography of Laplace in all time to come. "A mathematician of the highest rank, he lost not a moment in showing himself below mediocrity as a minister. In his very first attempt at business the consuls saw that they had made a mistake. Laplace looked at no question in its true point of view. He was always searching after subtleties; all his ideas were problems, and he carried the spirit of the infinitesimal calculus into the management of business." This pointed satire is not, we suspect, one of which the force will be always admitted; first, because it is so very like what a satirist ought to say of a mathematician; secondly, because the character of Laplace's mathematical writings is signally and ridiculously the opposite of all the preceding, as we shall presently notice. That Laplace was an incompetent minister is probable; but this is not the worst.

In 1814 he voted for the deposition of his benefactor, a step which might have been justifiable on public grounds: but nothing can excuse the suppression of the dedication to Napoleon, which stood at the front of his 'Théorie des Probabilités' during the prosperity of his benefactor, and no longer. Laplace, who had been created a count by Napoleon, and a marquis by Louis XVIII. immediately after the restoration, did not appear at court during the short restoration of the former. Of his political conduct during the revolution we have no account, except that he was at one time under the suspicion of the authorities, and was removed from the commission of weights and measures. In the suppression of the dedication, which we now cite entire, and which appeared in 1812, and not in 1814, there is a

prima facie appearance of ingratitude and pusillanimity, the evidence of which, if not answered, should be perpetuated.

"A Napoléon-le-Grand.—Sire, La bienveillance avec laquelle V.M. a daigné accueillir l'hommage de mon traité de Mécanique Céleste, m'a inspiré le désir de lui dédier cet ouvrage sur le calcul des Probabilités. Ce calcul délicat s'étend aux questions les plus importantes de la vie, qui ne sont en effet pour la plupart que des problèmes de probabilité. Il doit sur ce rapport intéresser V.M., dont le génie sait si bien apprécier et si dignement encourager tout ce qui peut contribuer au progrès des lumières et de la prospérité publique. J'ose la supplier d'agréer ce nouvel hommage dicté par la plus vive reconnaissance, et par les sentimens profonds de l'admiration et de respect avec lesquels je suis, Sire, de V. M. le très humble et très obéissant serviteur et fidèle sujet, *Laplace*."

As if to make such a suppression as striking as possible, Laplace had said, ten years before, in the dedication of the third volume of the 'Mécanique Céleste,' to the First Consul, "Puisse cet ouvrage, consacré à la plus sublime des sciences naturelles, être un monument durable de la reconnaissance que votre accueil et les bienfaits du gouvernement inspirent à ceux qui les cultivent. De toutes les vertés qu'il renferme, l'expression de ce sentiment sera toujours pour moi la plus précieuse." Laplace did not live to publish the second edition of the 'Mécanique Céleste.'

After the final Restoration Laplace's only public employments were of a scientific character, and he died on the 5th of May 1827. His last words were, "Ce que nous connaissons est peu de chose; ce que nous ignorons est immense."

"The Author of the Mécanique Céleste," to use a common synonyme for Laplace, must be an object of the admiration of posterity as long as any record of the 18th century exists. With the exception of some experiments made in conjunction with Lavoisier, to determine the quantity of heat in different bodies, we do not find that Laplace was employed in actual experiment. But for many years he was the head, though not the hand of European astronomy; and most of the labours of observation were made in directions pointed out by him, or for the furtherance of his discoveries in the consequences of the law of gravitation. Before however we begin to speak of them, there is an important caution, for the want of which a reader of the 'Mécanique Céleste' might even overrate Laplace, great as he is.

The French school of writers on mathematical subjects has for a long time been wedded to the reprehensible habit of omitting all notice of their predecessors, and Laplace is the most striking instance of this practice, which he carried to the utmost extent. In that part of the 'Mécanique Céleste' in which he revels in the results of Lagrange, there is no mention of the name of the latter. The reader who has studied the works of preceding writers will find him, in the 'Théorie des Probabilités,' anticipated by De Moivre, James Bernoulli, &c., on certain points. But there is not a hint that any one had previously given those results from which perhaps his sagacity led him to his own more general method. The reader of the 'Mécanique Céleste' will find that, for anything he can see to the contrary, Euler, Clairaut, D'Alembert, and above all Lagrange, need never have existed. The reader of the 'Système du Monde' finds Laplace referring to himself in almost every page, while now and then, perhaps not twenty times in all, his predecessors in theory are mentioned with a scanty reference to what they have done; while the names of observers, between whom and himself there could be no rivalry, occur in many places. To such an absurd pitch is this suppression carried, that even Taylor's name is not mentioned in connection with his celebrated theorem; but Laplace gravely informs his readers, "Nous donnerons quelques théorèmes généraux qui nous seront utiles dans la suite," those general theorems being known all over Europe by the names of Maclaurin, Taylor, and Lagrange. And even in his 'Theory of Probabilities,' *Lagrange's theorem* is only "la formule (p) du numéro 21 du second livre" de la Mécanique Céleste. It is true that at the end of the 'Mécanique Céleste' he gives historical accounts, in a condensed form, of the discoveries of others; but these accounts never in any one instance answer the question—Which pages of the preceding part of the work contain the original matter of Laplace, and in which is he only following the track of his predecessor?

The consequence is, that a student who has followed the writings of Laplace with that admiration which they must command, is staggered when he comes afterwards to find that in almost every part of the work there are important steps which do not belong to Laplace at all. He is then apt to imagine that when he reads more extensively he shall find himself obliged to restore more and more to the right owner, until nothing is left which can make a reputation such as is that of Laplace with the world at large. Such an impression would be wholly incorrect; but it would be no more than the just reward of the practice of suppression. Nevertheless the researches on the figure of the planets in the 'Mécanique Céleste,' and the general method of the 'Théorie des Probabilités' for the approximation to the values of definite integrals, are alone sufficient, when all needful restoration has been made, to enable us to say, that Laplace was one of the greatest of mathematicians.

The first two volumes of the 'Mécanique Céleste' appeared in the year VII. of the Republic (which lasted from the 22nd of September BIOC. DIV. VOL. III.

1798, to the 21st of September 1799), and may have been the inducement of the First Consul to make Laplace a member of the government. The third volume appeared in 1802, the fourth in 1805, and the fifth in 1825. A posthumous Supplement has appeared. The headings of the chapters throughout will be a more useful appendage to an article in a work of reference than any account which we could find room for, especially with regard to a philosopher whose discoveries are, like those of Newton, dwelt on in every popular work.

In vol. i. are found—

BOOK I. *On the General Laws of Equilibrium and Motion*.—Chap. 1, On the Equilibrium and Composition of Forces which act on a Material Point; chap. 2, On the Motion of a Material Point; chap. 3, On the Equilibrium of a System of Bodies; chap. 4, On the Equilibrium of Fluids; chap. 5, General Principles of the Motion of a System of Bodies; chap. 6, On the Laws of Motion of a System of Bodies, for all Relations between the Force and Velocity which are mathematically possible; chap. 7, On the Motion of a Solid Body of any Figure; chap. 8, On the Motion of Fluids.

BOOK II. *On the Law of Universal Gravitation, and on the Motion of the Centres of Gravity of the Heavenly Bodies*.—Chap. 1, On the Law of Universal Gravitation, collected from Phenomena; chap. 2, On the Differential Equations of the Motion of a System of Bodies acting on each other by their mutual Attraction; chap. 3, First Approximation to the Celestial Motions, or Theory of the Elliptic Motion; chap. 4, Determination of the Elements of the Elliptic Motion; chap. 5, General Methods for determining the Motions of the Heavenly Bodies by successive Approximation; chap. 6, Second Approximation to the Celestial Motions, or Theory of their Perturbations; chap. 7, On the Secular Inequalities of the Celestial Motions; chap. 8, Second method of Approximation to the Celestial Motions (by the Variation of Elements).

In vol. ii. are contained—

BOOK III. *On the Figure of the Celestial Bodies*.—Chap. 1, On the Attraction of Homogeneous Spheroids, terminated by surfaces of the second order; chap. 2, Development of the Attraction of all Spheroids in Series; chap. 3, On the Figure of Equilibrium of a Homogeneous Fluid Mass which has a Rotatory Motion; chap. 4, On the Figure of a Spheroid which differs little from a Sphere, and is covered by a stratum of fluid in equilibrio; chap. 5, Comparison of the preceding theory with observation; chap. 6, On the Figure of Saturn's Ring; chap. 7, On the Figure of the Atmospheres of the Heavenly Bodies.

BOOK IV. *On the Oscillations of the Sea and the Atmosphere*.—Chap. 1, Theory of the Ebb and Flow of the Sea; chap. 2, On the Stability of the Equilibrium of the Sea; chap. 3, On the method of taking into account, in the Theory of the Tides, the various circumstances peculiar to each port; chap. 4, Comparison of the preceding theory with observation.

BOOK V. *On the Motion of the Celestial Bodies about their Centres of Gravity*.—Chap. 1, On the Motion of the Earth about its Centre of Gravity; chap. 2, On the Motion of the Moon about its Centre of Gravity; chap. 3, On the Motion of the Rings of Saturn about their Centres of Gravity.

In vol. iii. are contained—

BOOK VI. *Particular Theories of the Planets*.—Chap. 1, Formulæ for the Planetary Inequalities depending on the squares and higher powers of the Excentricities and Inclinations of the Orbits; chap. 2, Inequalities depending on the Square of the Disturbing Force; chap. 3, Perturbations due to the Ellipticity of the Sun; chap. 4, Perturbations of the Motion of the Planets, arising from the action of their Satellites; chap. 5, Considerations on the Elliptic part of the Radius Vector; chap. 6, Numerical values of the quantities contained in the expressions for the Planetary Inequalities; chap. 7, Numerical expressions for the Secular Variations of the Elements; chap. 8, Theory of Mercury; chap. 9, Theory of Venus; chap. 10, Theory of the Motion of the Earth; chap. 11, Theory of Mars; chap. 12, Theory of Jupiter; chap. 13, Theory of Saturn; chap. 14, Theory of Uranus; chap. 15, On some equations of condition which exist between the Planetary Inequalities, and which serve to verify them; chap. 16, On the Masses of the Planets and the Moon; chap. 17, On the Formation of Astronomical Tables, and on the Invariable Plane of the Planetary System; chap. 18, On the Action of the Stars upon the Planetary System.

BOOK VII. *Theory of the Moon*.—General considerations not arranged as a chapter. Chap. 1, Integration of the Differential Equations of the Lunar Motion; chap. 2, On the Lunar Inequalities due to the Non-sphericity of the Earth and Moon; chap. 3, On the Lunar Inequalities due to the Action of the Planets; chap. 4, Comparison of the preceding theory with observation; chap. 5, On an Inequality of long period which appears to exist in the Lunar Motion; chap. 6, On the Secular Variations in the Motion of the Moon and the Earth, which may be produced by the resistance of an Ethereal Fluid.

In vol. iv. are contained—

BOOK VIII. *Theory of the Satellites of Jupiter, Saturn, and Uranus*.—Chap. 1, Equations of Motion of the Satellites of Jupiter, taking into consideration their Mutual Attractions, that of the Sun, and that of the Oblate Spheroid of Jupiter; chap. 2, On the Inequalities of the

Motion of Jupiter's Satellites, independent of the Eccentricities and Inclinations of the Orbits; chap. 3, On the Inequalities of the Motion of the Satellites, depending on the Eccentricities of the Orbits; chap. 4, On the Inequalities of the Motion of the Satellites in Latitude; chap. 5, On the Inequalities depending on the Squares and Products of the Eccentricities and Inclinations of the Orbits; chap. 6, On the Inequalities depending on the Squares of the Disturbing Force; chap. 6, the second (misprint), Numerical values of the preceding inequalities; chap. 7, On the Duration of the Eclipses of the Satellites; chap. 8, Determination of the Masses of the Satellites, and of the Oblateness of Jupiter; chap. 9, On the Eccentricities and Inclinations of the Orbits of the Satellites; chap. 10, On the Libration of the Three First Satellites of Jupiter; chap. 11, Theory of the Fourth Satellite; chap. 12, Theory of the Third Satellite; chap. 13, Theory of the Second Satellite; chap. 14, Theory of the First Satellite; chap. 15, On the Duration of the Eclipses of the Satellites, containing the comparison with observation; chap. 16, On the Satellites of Saturn; 17, On the Satellites of Uranus.

BOOK IX. *Theory of Comets*.—Chap. 1, Theory of the Perturbation of Comets; chap. 2, On the Perturbations of a Comet when it approaches very near a Planet; chap. 3, On the Action of Comets on Planets, and on the Masses of Comets.

BOOK X. *On Various Points of the System of the Universe*.—Chap. 1, On Astronomical Refraction; chap. 2, On Terrestrial Refraction; chap. 3, On the Extinction of the Light of Stars by the Atmosphere, and on the Atmosphere of the Sun; chap. 4, On the Measurement of Altitudes by the Barometer; chap. 5, On the Descent of Bodies which fall from a great height; chap. 6, On some Cases in which the Motion of several Attracting Bodies can be rigorously obtained; chap. 7, On the Alterations which the Motion of Planets or Comets may undergo by the resistance of the media which they traverse, and by the gradual transmission of gravity; chap. 8, Supplement to the Theories of Jupiter, Saturn, and the Moon; chap. 9, On the Masses of the Planets and Satellites, and on Astronomical Tables.

SUPPLEMENT TO BOOK X. *On Capillary Attraction*.—Section 1, Theory of Capillary Attraction; section 2, Comparison with experiment.

In vol. v. are contained—

BOOK XI. *On the Figure and Rotation of the Earth*.—Chap. 1, Historical Notice; chap. 2, On the Figure of the Earth; chap. 3, On the Axis of Rotation of the Earth; chap. 4, On the Temperature of the Earth, and on the Diminution of the Length of the Day by its cooling.

BOOK XII. *On the Attraction and Repulsion of Spheres, and on the Laws of Equilibrium and Motion of Elastic Fluids*.—Chap. 1, Historical Notice; chap. 2, On the Attraction of Spheres, and the Repulsion of Elastic Fluids; chap. 3, On the Velocity of Sound, the Motion of Elastic Fluids, and on Aqueous Vapour.

BOOK XIII. *On the Oscillations of the Fluids which cover the Planets*.—Chap. 1, Historical Notice, especially on the Tides; chap. 2, New Researches on the Tides; chap. 3, Comparison with observations, as to the Heights of Tides; chap. 4, Comparison with observations, as to the Times and Intervals of High Water; chap. 5, On the Partial Tides of which the period is about a day; chap. 6, On the Partial Tides which depend on the fourth inverse power of the Moon's Distance; chap. 7, On the Tides of the Atmosphere.

BOOK XIV. *On the Motion of the Celestial Bodies about their Centres of Gravity*.—Chap. 1, Historical Notice of and Formulæ on the Precession of the Equinoxes; chap. 2, Historical Notice of and Remarks on the Libration of the Moon; chap. 3, Historical Notice of the King of Saturn.

BOOK XV. *On the Motion of the Planets and Comets*.—Chap. 1, Historical Notice; chap. 2, Considerations supplemental to the second book—On the Variation of Elements; on the Development of the Mutual Distance of Two Planets; on the Great Inequality of Jupiter and Saturn; on the Determination of the Orbits of Comets by observation.

BOOK XVI. *On the Motion of Satellites*.—Chap. 1, On the Motion of the Moon—Historical Notice; chap. 2, On the Lunar Theory of Newton; chap. 3, On a Lunar Inequality of long period depending on the Difference of the Two Terrestrial Hemispheres, and also on those depending on the Elliptic part of the Earth's Radius; chap. 4, On the Law of Universal Attraction; chap. 5, On the Motion of the Satellites of Jupiter—Historical Notice; chap. 6, On the Influence of the Great Inequalities of Jupiter on the Motion of his Satellites; chap. 7, On the Satellites of Saturn and Uranus.

SECOND SUPPLEMENT (the first follows the tenth book).—An extended Theory of Capillary Attraction (no date).

THIRD (and posthumous) SUPPLEMENT (1827).—On the Development of the Distance of Two Planets, and of its Elliptic Co-ordinates; On the Tides of the Atmosphere.

We have spoken freely of the defects of Laplace's character, both political and scientific, and it is now our more pleasing task to say a few words on the 'Mécanique Céleste,' as a whole. We might dwell upon the great discoveries, such as those of the long inequality of Saturn and Jupiter, the cause of the acceleration of the moon's mean motion, the explanation of the peculiarities in the motion of Jupiter's satellites, with a long train of similar achievements; but this, though

the most common method of describing the character of a philosopher, is not the sort of description which should be given of the 'Mécanique Céleste.' Its bulk is about 2000 quarto pages; and, owing to the omission of all the steps which a good mathematician may be relied on as able to supply, it would, if expanded to the extent in which Euler would have written the same matter, have probably reached 10,000 pages. If all this work had been collected by one man, even from the writings of others, we should have called him the Delambre of the theory of gravitation, and should have prized his writings for their extent, their faithful representation of the state of the science at a particular time, and the diligence displayed in the undertaking. When to the preceding, which is forgotten in the splendour of some of the results, we add that to Laplace is due the discovery of much, the development of more, and that by the employment of his own resources in a manner which takes all the originality and power of the investigator, and the arrangement and combination of the whole, we may begin to see how he has earned his fame.

There is moreover another consideration which applies to the author of the 'Mécanique Céleste' more than to any other, except that of the 'Principia.' When an investigator produces one result after another, upon detached and unconnected subjects, we may feel admiration of his skill and sagacity; but we can never know whether he followed a route with the determination of overcoming a specific difficulty or not. He tells us where he succeeded, but not where he failed. It is otherwise when an original writer attempts a complete system, at every part of which he must work, and must show the world either a result or a blank. It is seldom that Laplace leaves off at the same point with his predecessors, though obliged, as just stated, to strive for pre-eminence on every single point. Had he consulted his own glory, he would have taken care always to note exactly that part of his own work in which he had a forerunner; and it is not until this shall have been well and precisely done, that his labours will receive their proper appreciation. His mathematical style is utterly destitute of the symmetry of that of Lagrange and the simplicity of that of Euler, and he is frequently even clumsy. He pays little attention to extreme correctness of form. Upon fundamental principles, whether of mechanics or analysis, he frequently needs a commentator, at least for the student.

Laplace explained his discoveries in a work entitled 'Exposition du Système du Monde,' of which the fifth edition bears the date 1824. The account here given is in style and clearness of a superior kind, somewhat too egotistical, and partaking of the disposition to suppression already noticed. A similar companion to the 'Theory of Probabilities' appeared as a preface to the work itself, and was published separately (fifth edition, 1825), under the title of 'Essai Philosophique sur les Probabilités.' A little treatise, published in 1821, called 'Précis de l'Histoire de l'Astronomie,' afterwards was made the fifth book of the fifth edition of the 'Système du Monde.' His lectures on the elementary branches of mathematics are in the 'Leçons de l'École Normale.'

Of the 'Théorie des Probabilités' we must speak precisely as of the 'Mécanique Céleste,' adding perhaps that there is no part of the latter in which more original power is displayed than in the former. The subject being somewhat isolated, its results are little known; they have however been extensively applied to astronomy, both by Laplace himself, and particularly by the German writers.

The 'Mécanique Céleste' was partly translated into English by a learned American writer, Dr. Bowditch, whose death, though it prevented his superintending the close of his work, did not take place till the whole was ready for press. The well-known work of Mr. Somerville is a selection from the 'Mécanique Céleste,' involving all the fundamental parts of the theory of gravitation. The 'Système du Monde' was translated by the late astronomer-royal, Mr. Pond. The fundamental parts of the 'Théorie des Probabilités' will be found in the 'Encyclopædia Metropolitana,' article 'Theory of Probabilities,' by Mr. De Morgan; and the method of using Laplace's results, with no other knowledge than that of common arithmetic, in the 'Essay on Probabilities,' by the same author, in Dr. Lardner's 'Cabinet Cyclopædia.' In the article on 'Probabilities' in the 'Encyclopædia Britannica' the same results of analysis are treated.

It is sometimes stated by English writers that Laplace was an atheist. We have attentively examined every passage which has been brought in proof of this assertion, and we can find nothing which makes either for or against such a supposition. It is easy, with an hypothesis, to interpret passages of an author; but we are quite convinced that a person reading Laplace for philosophical information would meet with nothing which could either raise or solve a question as to the writer's opinions on the fundamental point of natural religion, unless it had been put into his head to look. An attempt to explain how the solar system might possibly have arisen from the cooling of a mass of fluid or vapour is called atheistical, because it attempts to ascend one step in the chain of causes; the 'Principia' of Newton was designated by the same term, and for a similar reason. What Laplace's opinions were, we do not know; and it is not fair that a writer who, at a time of perfect licence on such matters, has studiously avoided entering on the subject, should be stated of one opinion or the other, upon the authority of a few passages of which it can only be said (as it could equally be said of most mathematical works) that they might

have been written by a person of any religious or political sentiments whatever.

LAPPO, ARNOLFO DI, the name by which a very celebrated and one of the most early of the Italian architects is known. He is so called by Vasari, and is said by him to have been the son of Lapo, a German, whose real name was Jacob, and who was sometimes called in Florence Jacopo Tedesco, but more frequently Lapo. This Lapo, who executed many works in Florence, died there, according to Vasari, in 1262.

Recent researches however have shown that Arnolfo and Lapo were not otherwise connected further than that they were contemporaries in Florence. Arnolfo was the son of Cambio, a native of Colle, and, according to Vasari, was born in 1232. Arnolfo did for building, says Vasari, what Cimabue did for painting: he was the pupil of Cimabue in design. He was the greatest architect of his time in Florence, and was the architect of many important works. The walls of Florence, which were erected in 1284, were planned by Arnolfo. He built the hall of Or. San Michele, the old corn-market; the loggia and piazza De' Priori; and in 1294 he laid the foundations and built the great church of Santa Croce, now celebrated for its many magnificent monuments of distinguished Florentines. But his greatest work is the church of Santa Maria del Fiore, or the Cathedral of Florence, of which he laid the foundations in 1298, or, according to some accounts, in 1294. He raised the walls of the whole church, and covered part of it in, but the vast dome is the addition of Brunelleschi; it stands however on the foundations of Arnolfo, who also, according to his model, had intended to erect a dome in the centre, though lower and of less dimensions than the enormous pile of Brunelleschi, which is one of the largest domes in the world, and but little less than the gigantic vault of St. Peter's, which is an imitation of it. The models of Arnolfo and Brunelleschi are now both lost. For the erection of this immense church a tax of twopence per head was levied annually upon the citizens of Florence, and they were encouraged also by indulgences to make donations to its building-fund. The external marble facing of the walls is the work of Arnolfo. The old municipal palace, the Palazzo della Signoria, which still exists as a part of the old palace of the Florentine princes in the Piazza Granduca, was also built by Arnolfo; and there are works by him in other Italian cities: he executed in 1285 the marble tabernacle of the Basilica of San Paolo, without the walls, at Rome; and shortly before 1290 he designed and executed the monument of the Cardinal de Braye in the church of San Domenico at Orvieto. Arnolfo died, according to Vasari, in 1300. Arnolfo's portrait by Giotto is in the picture of the death of San Francesco, in the church of Santa Croce at Florence: it is one of the group of figures conversing together in the foreground.

*LAPPENBERG, JOHANN MARTIN, keeper of the archives of the senate of Hamburg, was born in that town July 30, 1794. He was sent by his father to study medicine at Edinburgh, but applied himself in preference to historical researches. After visiting the Highlands and the Hebrides, he proceeded to London, where he resided some time studying the nature of the constitution and administration of Great Britain. On returning to Germany he continued his investigation of jurisprudence in the universities of Berlin and Göttingen, and in 1816 received the degree of Doctor of Civil Law. At the time of the congress of Troppau, in 1820, he was sent by his native state as residuary minister to the court of Berlin, in which post he continued till 1823, when he was appointed archivist to the Hamburg senate. He devoted himself to the duties of his office, and discovered many valuable historical records supposed to be lost. A journey to the north of Europe also enabled him to add materially to his diplomatic collections. Besides many essays and smaller papers, chiefly on historical subjects, scattered in German and English periodical publications, he has written several works of great interest, among the more important of which are—a continuation of Sartorius' 'Authentic History of the Origin of the German Hanse Towns,' Hamburg, 1830; on the 'Former Extent and History of Heligoland,' Hamburg, 1831; a 'History of England under the Anglo-Saxon Kings,' Hamburg, 1834-37, a work of much research and of great value to all interested in our early history, which has been translated by Mr. Benjamin Thorp, who has made corrections and additions to it, with additional corrections from the author, and which was published in London in 2 vols. 8vo, 1845; an edition of Ditmar of Merseburg, in Perry's 'Monumenta Germaniæ historica,' in 2 vols. fol. Hanover, 1839; 'Sources of the History of the Archbishopric and State of Bremen,' and several smaller works relating to his native town, such as the 'History of Printing in Hamburg,' &c., &c.

LARCHE'R, PIERRE HENRI, was born at Dijon in 1726. Larcher applied himself especially to the study of the Greek classics, and made himself known by several translations from them, the principal of which is his translation of Herodotus, with a commentary, Paris, 1786, a useful book, which was republished in an improved edition, 9 vols. 8vo, 1805. In 1774 Larcher published a 'Memoir on the Goddess Venus,' which obtained the prize of the Academy of Inscriptions, of which body he afterwards became a member. He had a controversy with Voltaire, in consequence of some strictures which he wrote on Voltaire's 'Philosophie de l'Histoire.' Voltaire replied in his usual sarcastic vein in the 'Défense de mon Oncle,' and Larcher answered him in the 'Réponse à la Défense de mon Oncle.' After the revolu-

tion, Larcher was made a member of the National Institute. He died at Paris, in December 1812.

Larcher's translation of Herodotus, which is his chief work, has the merit of being generally correct, but it has no recommendations of style, and as a work of art it altogether fails to represent the beautiful simplicity of the original. The commentary on the text is still useful, though it is far from containing all that might now be added in illustration of Herodotus. Larcher also translated the 'Anabasis' of Xenophon.

*LARDNER, REV. DIONYSIUS, LL.D., was born April 8rd, 1793, in the city of Dublin, where his father was a solicitor. At the age of fourteen he was placed in his father's office, but having taken a dislike to the profession, in 1812 he was entered of Trinity College, Dublin, where he took his degree of B.A. in 1817, having previously obtained several prizes in logic, mathematics, natural philosophy, astronomy, and moral philosophy. He continued to reside in the University as a member till 1827, and in the meantime published a 'Treatise on Algebraic Geometry,' 8vo, 1823; a 'Treatise on Trigonometry,' a 'Treatise on Differential and Integral Calculus,' 8vo, 1825; and a 'Treatise on Solid Geometry,' besides several articles on mathematical subjects which he contributed to the 'Edinburgh Encyclopædia' and the 'Encyclopædia Metropolitana.' He afterwards delivered a course of lectures before the Royal Dublin Society, for which, in addition to the usual remuneration, he was presented with a gold medal. These lectures he published in 1828, 'Popular Lectures on the Steam-Engine,' 8vo, a work which has been improved and extended in several subsequent editions. In the year 1828, when the London University, now University College, was established, Mr. Lardner was appointed professor of natural philosophy and astronomy, and in the same year published 'A Discourse on the Advantages of Natural Philosophy,' 8vo, and 'An Analytical Treatise on Plane and Spherical Trigonometry,' 8vo. In 1830 he commenced the 'Cabinet Library,' 9 vols. 12mo, 1830-32, and in the same year projected and commenced an extensive series of works by writers of the highest class, well-known as Lardner's 'Cabinet Cyclopædia,' 134 vols. 12mo, 1830-44. For this series Dr. Lardner furnished 'Hydrostatics and Pneumatics,' 'Mechanics' with Captain Kater, a 'Treatise on Heat,' 'Treatise on Arithmetic,' 'Treatise on Geometry,' and 'Lardner and Walker's Electricity,' 2 vols. For the 'Library of Useful Knowledge' he wrote several treatises on different branches of natural philosophy. Between the years 1830 and 1840 he was also an occasional contributor to the 'Edinburgh Review' and other periodical works. In 1840 circumstances of a private nature occasioned Dr. Lardner to go to Paris, and afterwards to North America, where he delivered lectures in most of the cities and towns of the United States. The lectures were afterwards published in two large volumes, which have been there frequently reprinted. Dr. Lardner returned to Europe in 1845, and settled in Paris, where he still continues to reside. He has since published a 'Handbook of Natural Philosophy and Astronomy,' 2 vols. 12mo, 1851-52, and 'The Great Exhibition reviewed,' 12mo, 1852. In 1854 he commenced the publication of 'The Museum of Science and Art,' a series of essays on the physical sciences and their applications to the industrial arts. This series is now complete in 12 vols. 12mo. In 1854, 1855, and 1856 he published in 8vo 'Handbooks' of 'Natural Philosophy and Hydrostatics,' of 'Pneumatics and Heat,' of 'Natural Philosophy and Mechanics,' of 'Natural Philosophy, Electricity, Magnetism, and Acoustics,' and of 'Natural Philosophy and Optics.'

LARDNER, NATHANIEL, D.D., was born in 1684, and devoted a long life to the prosecution of theological inquiry, to the exclusion of attention to almost any other subject. The results which he communicated to the world from time to time show at once the assiduity with which he laboured in this department, and the ability which he possessed to conduct his learned researches to a successful issue.

Dr. Lardner was an English dissenting minister, belonging to the denomination called Presbyterian, but which had adopted the opinions known as Unitarian. In early life he was a pupil of Dr. Joshua Oldfield, a minister of eminence in that denomination, but he took a course which many of the Dissenters of his time took—going abroad to prosecute his studies. He spent more than three years at Utrecht, where he studied under Gravivus and Burmann, and was then some time at Leyden. He returned to England in 1703, and continued prosecuting his theological studies with a view to the ministry; but it was not till he was twenty-five that he began to preach. The course of his after-life is soon described. He became private chaplain in the family of Lady Treby, who died in 1729; and was a lecturer at the chapel in the Old Jewry. He was not acceptable as a preacher owing to the want of power to modulate his voice, arising from the imperfection of his sense of hearing. He died in 1768.

The religious sect to which he belonged have no means of placing their scholars in any situations which can leave them at liberty to prosecute those studies, the results of which are of the most essential benefit to the great interests which they hold peculiarly dear; so that Dr. Lardner was thrown for the most part upon his own resources while engaged in those profound inquiries which have gained for him a name among the first theological scholars of his age and country. His 'Credibility of the Gospel History,' the 'Supplement' to it, and his 'Jewish and Heathen Testimonies,' have received the testimony of the most distinguished persons, as constituting the most unanswerable

defence of Christianity that has yet been prepared. These are his great works, but there are beside them many other treatises in which he has brought his store of learning to bear on questions which are important in Christian theology. The most remarkable of these his minor publications is his 'Letter on the Logos,' in which it distinctly appears that he was of the Unitarian or Socinian school. The best edition of Larra's works is that by Dr. Andrew Kippis; but it is no mean proof of the estimation in which they are held, that large as they are when collected together, the booksellers but a few years ago ventured on a republication of them.

LARRA, MARIANO JOSÉ DE, a popular Spanish writer on literary and political subjects, was born at Madrid on the 4th of March 1809. His father, a physician of repute, was an adherent of King Joseph, and found himself obliged to leave Spain with the French army when it was driven out of the country at the close of the Peninsular War. The boy, who was taken with him, was first sent to school in France, and when the family obtained permission to return to Spain in 1817, it was found that he had almost entirely forgotten the Spanish language. This deficiency was however soon repaired, and he was noted in after life for the freedom and raciness of his Spanish, and his hostility to the practice of sullyng its purity with Gallic idioms. As a boy he was remarkably fond of study and averse to ordinary pastimes, and it was then generally augured that he would become what is termed a bookish man. As he approached manhood his whole character appeared to change; a quarrel with his father, which was never made up, and which was connected, either as cause or effect, with his abandonment of the study of the law, threw him on the world without resources, and at the age of twenty he contracted a marriage which he afterwards repented, and gave his wife reason to repent. For a profession he adopted that of literature, which, in the time of Ferdinand, was miserably ill-paid in Spain, and so surrounded with restrictions that the works then published had no value in his own eyes, and they were systematically omitted by himself in afterwards collecting his works. It was in 1832 when these restrictions were relaxed that he first gained a success with a series of periodical essays called 'El Pobrecito Habrador,' which however was impeded by Calomarde's ministry, and stopped by Zea's at its fourteenth number. The freedom of the press however soon followed, and Larra commenced in the 'Revista Española,' under the signature of Figaro, a series of sketches of Spanish manners, similar to those of Jouy's 'Hermit in Paris,' and Macdonough's now forgotten 'Hermit in London.' Intermingled with these were lively theatrical criticisms, and some sharp political articles of a witty character, and Larra also wrote a novel and a play, besides translating several plays from the French. The name of Figaro was soon universally known, Larra began to move in the first circles, was a constant guest at the English embassy, where he was a favourite companion of the ambassador Mr. Villiers, now earl of Clarendon, and was presented to Queen Christina at her own desire. In 1835 he took a trip to Portugal, England and France, and was received in the best society of London and Paris, but at the end of ten months returned abruptly to Madrid, and gave as a reason that he could not do without the "sun and chocolate." He said in one of his Figaro essays, speaking of comic authors, "If I might dare to mention myself in company with Molière and Moratin, if I too might be allowed to claim the title of 'satirical writer,' I would frankly confess that it is only in moments of melancholy that I aspire to amuse the public." His friends knew this to be too true. He was a prey to the blackest and most incessant melancholy. While also his manners in society were the perfection of polish, his wife and family were the victims of his ill-temper at home. All came to a sudden close. An intrigue with a married woman, which had lasted five years, was cut short by a determination on her part to relinquish his society: on the 13th of February 1837 Larra had an interview with her at his own house, to prevail on her to give up her intention, but his entreaties were in vain. She left him, and, when some time after, his little daughter entered the room she found her father's corpse stretched on the floor before a mirror, which had probably helped him to aim the pistol which blew his brains out. His remains, even under these circumstances, were honoured with a public funeral, and among those who recited verses over his grave was a boy of eighteen, whose fame dates from that day, when he was hailed by the mourners with sudden enthusiasm as a compensation for their loss. This was the leading living poet of Spain, Don José Zorrilla.

A collection of Larra's articles in the periodicals was made, and had partly run to a second edition during his life-time. A collection of his entire works was published after his death in Spanish America, another collection appeared at Madrid in 1843, and this was reprinted in two volumes in 1848 in Baudry's Paris 'Coleccion de los mejores Autores Españoles.' The short essays are undoubtedly his best productions, they are happily deficient in that "gravity" of which the Spaniards are in general too fond, and yet are so thoroughly Spanish in their colouring that after the lapse of more than twenty years they seem to have rather gained than lost in popularity. His novel 'El Doncel de Don Enrique el Doliente,' ('The Page of Don Henry the Melancholy'), written in imitation of Walter Scott, is on the contrary heavy and cumbersome. It is founded on the history of the Gallican poet of the 15th century, Macias 'el Enamorado,

who was killed by the husband of a lady to whom he addressed his verses. The same story is the theme of one of Larra's plays, 'Macias,' in which he treats the whole subject so differently and with so much more spirit, that no one would, without positive information of the fact, suppose that both play and novel were by the same author. His other dramas are mostly adaptations or translations from the French. It is singular that the last of them bears the title of 'Thy Love or Death' ('Tu Amor ó la Muerte'), so applicable to his own unhappy end.

LARREY, DOMINIQUE-JEAN, BARON, was born at Beaucaeu, near Baguères de Bigorre, in France, in July 1766. He studied the elements of medicine and surgery at the hospital at Toulouse, under the direction of his uncle Alexis Larrey, who practised medicine in that city. In 1787 he went to study his profession in Paris, and obtained the appointment of surgeon to the frigate *Vigilante*, in which he visited North America. He returned to Paris at the commencement of the revolution, and in 1792 joined the French army which was then carrying on its operations on the Rhine. Here he distinguished himself by the invention of the ambulances volantes, by means of which the wounded, being first dressed, were carried off the field of battle, even under the fire of batteries. He was at the siege of Toulon, where he became acquainted with Napoleon Bonaparte, who was then a lieutenant of artillery. In 1796 he was appointed a professor in the school of medicine and military surgery at Val de Grace. In 1798 he accompanied the French army with Napoleon to Egypt, and on his return published an historical and surgical account of the expedition, with the title 'Relation historique et chirurgicale de l'Expedition de l'Armée d'Orient en Egypte et en Syrie,' 8vo, Paris, 1803. From this time he was advanced to various honourable positions; after the battle of Wagram he was made a Baron of the Empire, and in 1812 he was made surgeon-in-chief of the imperial army.

An anecdote is related of Larrey which shows his courage, and proves that he did not obtain the good graces of the Emperor by any sacrifice of character. After the battles of Bautzen and Würchen it was suggested to Bonaparte that the number of the wounded had been increased by voluntary mutilation. He immediately ordered that the suspected, to the number of 1200, should be separated from the rest to be examined by the surgeons, and if found guilty they should be shot. Nobody doubted the guilt of the parties, and great anxiety was shown to put the sentence into execution, when Larrey demanded time to examine the suspected persons accurately, and he reported that all the accused were innocent. He addressed a report to this effect to Napoleon, expecting that his dismissal would follow. The contrary was the case, for Napoleon sent him a letter in return with a present of 6000 francs, and the warrant of a pension of 3000 to be paid from his own privy purse. Napoleon bequeathed to Larrey at his death 10,000 francs, at the same time expressing his conviction "Larrey was the most virtuous man he had ever known."

Larrey published many works besides that above referred to, which contain a great mass of valuable surgical observations. One of his earliest publications was his 'Dissertation sur les Amputations des Membres à la suite des coups de feu, étayée de plusieurs opérations,' Paris, 1796. In this work he demonstrated the necessity of immediate amputation after gun-shot wounds, and for the first time clearly pointed out the cases in which it was indicated. In addition to these works he published 'Mémoires de Chirurgie militaire et Campagnes,' 8vo, Paris, 1812; 'Recueil de Mémoires de Chirurgie,' 8vo, Paris, 1821. A multitude of papers scattered throughout the medical and surgical journals of France, the Bulletins of the Academy of Paris, and other volumes, on almost every department of surgery, bear testimony to his industry and talent, and the enlightened principles on which he based the practice of his profession. Some of these have been translated into most of the languages of Europe, and have obtained for Larrey a first position amongst modern surgeons. He died at Lyon, on the 25th of July 1841.

LASCARIS, ANDREAS JOHANNES, of the same family, but somewhat younger than CONSTANTINE LASCARIS, was called RHYNDACENUS, because he came from some place in Bithynia, near the banks of the Rhyndacus. Andreas Lascaris left Greece at the time of the Turkish conquest, and repaired to Florence, where Lorenzo de' Medici took him under his patronage, and afterwards sent him to Greece in order to collect valuable manuscripts, of which Lascaris brought back a considerable number to Italy. After the death of Lorenzo he went to France, and gave lessons in Greek at Paris. Budæus was one of his pupils. In 1503 he was sent by Louis XII. on a mission to Venice; after fulfilling which he went to Rome, where Leo X. gave him the direction of the Greek college which he had just founded. In 1518 Lascaris returned to Paris, and was employed, together with Budæus, in collecting and arranging the royal library of Fontainebleau; after which Francis I. sent him again to Venice as his ambassador. At last Pope Paul III. having pressed him very urgently to come to Rome, Lascaris set out, notwithstanding his advanced age and his infirmities; but a few months after his arrival at Rome he died, in 1535, being about ninety years of age. Lascaris published or edited the following Greek works:—'The Hymns of Callimachus,' with scholia; 'Commentaries on Sophocles,' a Greek Anthology, fol., 1494; 'Scholia on the Iliad,' and a dissertation, with the title, 'Homericarum Questionum et de Nympharum antro in Odyssea Opusculum,' Rome, 1518. Some other works are also attributed to Lascaris, such as 'De veris

Græcarum Literarum formis ac causis apud Antiquos, Paris, 1536, and a collection of epigrams in Greek and Latin, Paris, 1527.

LASCARIS, CONSTANTINE, a descendant of the imperial family of that name, emigrated from Constantinople at the time of the Turkish conquest to Italy, where Francesco Sforza, duke of Milan, entrusted him with the education of his daughter Ippolita, who married Alfonso duke of Calabria, son of Ferdinand king of Naples. Lascaris afterwards went to Rome and Naples, where he taught Greek and rhetoric. He lastly repaired to Messina, where he was treated with great distinction, and where he died towards the end of the 15th century, leaving his valuable manuscripts to the senate or municipal council of Messina. Those manuscripts were afterwards transferred by the Spaniards to the Escorial Library.

Lascaris published a Greek Grammar, Milan, 1476, which was afterwards translated into Latin, and went through several editions at Venice from the Aldine press, under the title of 'Compendium octo Orationis Partium,' &c. He also wrote two Opuscula on the Sicilians and Calabrese who had written in Greek, which were published by Maurolico in 1562, and also a 'Dissertation on Orpheus,' printed long after in the first volume of the 'Marmora Taurinensia.'

LASSO, ORLANDO DI, or ORLANDUS LASSUS, a very distinguished name in musical history, was born in 1520, at Mons in Flanders, but, says Thuanus, was, on account of his fine voice, forced away while a boy by Ferdinand Gonzago, and detained by him in Sicily and in Italy. Afterwards, being grown up, he taught during two years at Rome. He then travelled in France and England with Julius Cæsar Brancatius, and subsequently lived some years at Antwerp. On the invitation of Albert, duke of Bavaria, he next proceeded to Munich, where he married. But Charles IX. of France, whose conscience-pangs, on account of his share in the massacre of St. Bartholomew, admitted, like those of Saul, of no alleviation, save that afforded by music, offered Orlando the high and lucrative situation of 'maitre-de-chapelle' at his court, which the composer accepted, and, with his family, was on his way to Paris, when the death of the king arrested his progress, and he returned to Munich, where he died in 1594.

The compositions of Lasso are very numerous, and all show great knowledge of his art, much invention, and a manly determination not to be shackled by the rules and examples of the bigoted musicians of his time. "He was the first great improver of figurate music," Sir John Hawkins remarks; and Dr. Burney tells us that in his songs 'Alla Napolitana' "the chromatic accidental semitones are expressed by a sharp, and no longer left to the mercy and sagacity of the singer, as was before the constant custom." After his death, Rudolph, his eldest son, published a collection of his works, in seven volumes, under the title of 'Magnum Opus musicum Orlandi de Lasso, complectens omnes cantiones quas Motetas vulgo vocant, a 2 ad 12 voc.,' &c.; and at Munich is preserved among the musical archives a manuscript of his compositions, ornamented with superb vignettes. In the British Museum is a Latin motet by Orlando; and specimens of his genius are given by Hawkins and Burney, in their histories of music.

LATHAM, JOHN, was born June 27, 1740, at Eltham in Kent, the eldest son of a surgeon and apothecary of that place. He was educated at Merchant Taylor's school, but when only fifteen was removed in order to prepare himself for following his father's profession. He studied anatomy under Dr. William Hunter, and having completed his education at the London hospitals and schools of medicine, he commenced business at Dartford in 1763. He early addicted himself to the study of natural history, and in 1771 became the correspondent of Pennant, and almost immediately after contributed his assistance to Sir A. Lever in the formation of his museum. In 1781 he published the first volume of his 'General Synopsis of Birds.' This was continued at irregular intervals by five others, and two supplementary volumes completed the work in 1787. In the preface to the supplement he announced that he was then contemplating the 'Index Ornithologicus,' which appeared in 1791; but Gmelin's edition of Linnæus's 'Systema Naturæ' had appeared in 1788, and he had availed himself of Latham's labours so far that many of the birds there named were wholly unknown to Linnæus, and only known to Gmelin through Latham. In 1775 he had been elected a Fellow of the Royal Society; in 1778 a Corresponding Member of the Medical Society of London, and he was one of the founders of the Linnæan Society; in 1795 he received the diploma of M.D. from the university of Erlangen, and was nominated a member of the Natural History Society of Berlin and of the Royal Society of Stockholm; and in 1792 he became an F.S.A. In 1796 he retired from business and settled at Romsay in Hampshire. A reverse of fortune overtook him, and in 1819 he retired to the house of his son-in-law, Mr. N. Wickham, at Winchester. He had always diligently pursued his studies in natural history, and in 1821 he commenced the publication of the 'General History of Birds,' which was completed in ten volumes 4to. The plates of his original work had been all etched by himself from specimens all stuffed and prepared by himself, and for his history, when upwards of eighty, he retouched them. The works have always retained a high character for fidelity of representation and accuracy of description. We have here only mentioned the works on natural history, by which he is most widely known, but Dr. Latham also wrote on a great number of subjects, chiefly of a medical character, in the form of pamphlets, or of contributions to the 'Transactions' of the

Societies with which he was connected. After a short illness, he died on February 4, 1837, and was buried in the abbey-church of Romsay.

*LATHAM, ROBERT GORDON, a distinguished living philologist and ethnologist. He was born in the county of Lincolnshire, and received his early education at Eton. From thence he was entered a student at King's College, Cambridge, and in 1833 was made B.A. He was subsequently made a Fellow of his college, and took the degree of M.D. Shortly after obtaining his fellowship he travelled in the north of Europe, and published a short account of his travels. From an early period the bent of his genius was towards a philosophical study of language, and at Cambridge he was known for the extent of his knowledge, not only of the classical languages exclusively studied there, but for his acquaintance with European languages, and their relations to each other.

Shortly after the establishment of University College, London, he was appointed Professor of English Literature in that college. The course of study which he pursued here led him especially to investigate the history and structure of the English language, and resulted in the publication of a series of works, which have placed him at the head of the philosophical investigators of our native tongue. His most important work on this subject is his 'English Language,' a work which has gone through several editions, and is at present a standard book in all our educational institutions. This has been accompanied by the following works, all of which are used more or less generally where a systematic study of the English language is considered a point of importance:—'An Elementary English Grammar, for the use of Schools;' 'An English Grammar, for the use of Ladies Schools;' 'The History and Etymology of the English Language, for the use of Classical Schools;' 'A Grammar of the English Language, for the use of Commercial Schools.'

Dr. Latham's extensive knowledge of languages, combined with his medical studies, naturally led him to the study of the relations existing between the languages spoken and the structure of the various races of men. He early took an interest in the proceedings of the Ethnological Society of London, and in 1850 he published a work on the 'Varieties of Mankind.' This work is in many respects the most valuable contribution to the science of ethnology made during the present century. The author has not only attempted to simplify the classification of ethnologists, but from his extensive original researches into the nature and relations of language, has ventured to differ from those who had preceded him with regard to the relations of various large branches of the human race. This book has been followed by a series of works, in which he has carried out in detail the views he had previously sketched. Such are his 'Ethnology of the British Colonies,' published in 1851, and his 'Ethnology of Europe;' 'Ethnology of the British Islands;' and 'Man and his Migrations.' These last works consist principally of courses of lectures which had been delivered before various scientific societies in Great Britain.

Dr. Latham has frequently contributed papers at the meetings of the British Association for the Advancement of Science, and to his contributions may be mainly attributed the establishment of a section devoted to the discussion of ethnology at the meetings of this Association. When the directors of the Crystal Palace at Sydenham determined to devote a certain portion of their building to the illustration of ethnology, Dr. Latham was consulted, and the arrangement of this department was committed to his care.

Although Dr. Latham has for the present resigned the active duties of the medical profession, he has nevertheless secured its highest honours and held most important medical appointments. He is a Licentiate and Fellow of the Royal College of Physicians, London. He was appointed physician to the St. George's and St. James's Dispensary, and subsequently obtained the post of assistant physician to the Middlesex Hospital. In the medical school of this institution he held the appointment of lecturer on medical jurisprudence. In 1848 he translated and edited the works of Sydenham for the Sydenham Society. He is a Fellow of the Royal Society, Vice-President of the Ethnological Society, and member of many learned societies in America and on the Continent of Europe.

LATIMER, HUGH, Bishop of Worcester, the son of a farmer in Leicestershire, was born about the year 1472. He was educated first at a grammar-school, and afterwards at Cambridge, where he took a degree, previous to entering into holy orders. The preaching of Bilney directed his attention to errors in the doctrines and discipline of the Church of Rome; the subject soon engrossed his mind, and his "heretical preaching," as it was then called, caused a remonstrance to be made by the divines of Cambridge to the diocesan Bishop of Ely, and his interference was requested. The bishop, a mild and moderate man, visited Cambridge, but used no further harshness towards him than to forbid his preaching within the diocese, an obstacle which he overcame by gaining the use of a pulpit in a monastery exempt from episcopal jurisdiction. Latimer's eloquence, his moral conduct and kindness of disposition, together with the merits of his cause, gained him a large number of hearers. He was at this time a person of sufficient importance to be esteemed worthy of persecution, and was dealt with accordingly, but it was not until Henry VIII. had been thirty years upon the throne, that he became distinguished as one of the principal reformers.

Thomas Cromwell, the king's favourite, had already given him a

benefice in Wiltshire, where he had preached the Reformed doctrines with such plainness as to cause the bishops to cite him to London to answer for his heretical opinions. Cromwell continued afterwards to be his friend and patron: he rescued him from the perils of the citation, recommended him to Anne Bol-y'n, who appointed him her chaplain, and soon afterwards the bishopric of Worcester was conferred on him (1535). The duties of this see he performed in the most active and exemplary manner, and while holding visitations, giving instructions, and correcting abuses, never failed to promote the Reformation to the utmost of his power. Thus did he employ himself for three years, at the expiration of which passed the act of the Six Articles (Burnet, vol. i.), from which he so totally dissented, that he resigned his bishopric. Shaxton, bishop of Winchester, followed his example, but Cranmer retained his office.

Latimer now sought retirement in the country, where he would have continued to reside, had not an accident befallen him, the effects of which he thought the skill of London surgeons would alleviate. He arrived in London when the power of Cromwell was nearly at an end, and the mastery in the hands of Gardiner, who no sooner discovered him in his privacy, than he procured accusations to be made against him for his objections to the Six Articles, and he was committed to the Tower. Different causes being alleged against him, he remained a prisoner for six years; and not until the accession of Edward VI. did he obtain his liberation. The parliament then offered to restore him to his see, but he was firm in his refusal to receive it: his great age, he said, made him desirous of privacy. In this reign we find him the accuser of Bonner, occasionally the adviser of the king, and continually the strenuous reprobator of the vices of the age; but the reign was short, and with it expired Latimer's prosperity. In July 1553 King Edward died; in September Mary had begun to take vengeance on the Reformers, and among others Latimer was committed to the Tower. Though he was at least eighty years old, no consideration was shown for his great age; and he was sent to Oxford to dispute on the corporal presence. He had never been accounted very learned: he had not used Latin much, he told them, these twenty years, and was not able to dispute; but he would declare his faith, and then they might do as they pleased. He declared, that he thought the presence of Christ in the sacrament to be only spiritual: "he enlarged much against the sacrifice of the mass; and lamented that they had changed the communion into a private mass; that they had taken the cup away from the people; and, instead of service in a known tongue, were bringing the nation to a worship that they did not understand." (Burnet, vol. ii.) They laughed at him, and told him to answer their arguments; he reminded them that he was old, and that his memory had failed; the laughter however continued, and there was great disorder, perpetual shoutings, tauntings, and reproaches. When he was asked whether he would abjure his principles, he only answered, "I thank God most heartily that he hath prolonged my life to this end, that I may in this case glorify God with this kind of death." On the 16th of October 1555 he was led to the stake with Ridley, gunpowder being fastened about his body to hasten his death; it took fire with the first flame, and he died immediately. Latimer published several of his sermons at different times. They have been reprinted in 2 vols. 8vo, London, 1825.

Latimer was remarkable for moral excellence and simplicity rather than for learning, and for zeal rather than for ability: he was a good but not a great man.

LATREILLE, PIERRE-ANDRÉ, a French naturalist, particularly distinguished in the department of entomology, was born at Brives on the 29th of November 1762. Having shown an early taste for the study of natural history, and for literary pursuits generally, the Baron D'Espagnac, governor of the Hôtel des Invalides, brought him to Paris in 1778, and placed him in the college of the Cardinal Lemoine to be educated for the Church. Here he formed a friendship with the Abbé Haüy, who was a professor at the college. In 1786 he retired into the country, where he devoted all his leisure time to researches on insects. On going to Paris two years afterwards he formed an acquaintance with Fabricius, Olivier, and M. Bosc. Some curious plants which he presented to Lamarck procured him also the friendship of that great naturalist, whom he afterwards assisted in his lectures, and succeeded as professor in the Museum of Natural History. A memoir on the Mutiles of France (Hymenopterous insects), which was inserted in the 'Acts of the Society of Natural History at Paris,' procured him, in 1791, the title of Correspondent to this society, and shortly afterwards of the Linnæan Society of London. At this period he also wrote some of the articles on Entomology in the 'Encyclopédie Méthodique.' Hitherto he had only devoted a small portion of his time to scientific pursuits, not allowing it to interfere with the duties of his profession; but the revolution, which created so many reverses of fortune, obliged him to pursue for a living that study which he had only cultivated before as an amusement.

Being an ecclesiastic, he was devoted to persecution, and twice condemned to banishment, but he escaped this punishment through the influence of his scientific friends. Returning to Paris in 1798, he was named a Correspondent of the Institute; and through the recommendation of Lacépède, Lamarck, Cuvier, and Geoffroy St.-Hilaire, he obtained employment in the Museum, where he was appointed to arrange the collection of insects. When Lamarck became blind,

Latreille was named assistant professor, and he continued Lamarck's lectures on the Invertebrate Animals till that naturalist's death in 1829, when he filled the vacant chair of zoology.

The number of his literary productions is very considerable. 'Le Magazin Encyclopédique' of Millin, the 'Annales' and the 'Mémoires du Museum,' and the 'Bulletin de la Société philomathique' contain many papers and observations by him. In 1802 he published the 'Histoire des Fourmis,' which also contained several memoirs on other subjects, as on Bees and Spiders. Among his publications there is one which has been highly spoken of, and which differs in its object considerably from his other writings; this is a dissertation on the expedition of the consul Suetonius Paulinus in Africa, and upon the ancient geography of that country. His memoirs upon the sacred insects of the Egyptians, and on the general geographical distribution of insects, excited the attention of all naturalists. Latreille's 'Précis des Caractères génériques des Insectes' (Brives, 1796) was the first work in which these animals were distributed in natural families, and it formed the basis of his 'Genera Crustaceorum et Insectorum' (4 vols. 8vo, Paris, 1806-9), which is by far the best of all his productions. His 'Considérations générales sur l'Ordre naturel des Animaux composant les classes des Crustacés, des Arachnides, et des Insectes,' and the third volume of the 'Règne Animal' of Cuvier are only extracts, more or less modified, of this work. The system by which the insects are arranged in the 'Règne Animal' (the entomological part of which, it must be remembered, was written by Latreille, though it all stands under the name of Cuvier) is pronounced by Mr. Swainson to be "the most elaborate and the most perfect in its details that has yet been given to the world." It soon superseded that of Fabricius. "It possesses the advantage of being founded on a consideration of the entire structure of these animals, and hence gives us the first example, in theory, of the natural principle of classification." In Sonnini's edition of Buffon, Latreille has given a general history of insects; he also wrote a 'Histoire des Salamandres,' and many other works.

Latreille, by the almost universal consent of naturalists, stood at the head of the department of entomology in his own and other countries. He deserved this place by his knowledge of the external and internal organisation of insects, and by his acquaintance with their manners and habits.

Latreille was elected a member of the Academy of Sciences in 1814, and was made in 1821 Chevalier of the Legion of Honour. He died at Paris, on the 6th of February 1833, at the age of seventy.

LAUD, WILLIAM, was the son of a clothier at Reading in Berkshire, where he was born on the 7th of October 1573. Laud was sometimes reproached during his prosperity with the meanness of his birth, which however was not more humble than that of most of the churchmen of his time, and indeed of preceding times; for in truth Laud himself was mainly instrumental in rendering the Church of England the resort of men of good or noble family as a profession. Laud received his early education in the Free Grammar-School of Reading, from whence, in July 1589, he was removed to Oxford and entered a commoner of St. John's College, where he successively obtained a scholarship and fellowship. Even at the university Laud had the character of being "at least very Popishly inclined." Heylyn informs us that Dr. Abbot, master of University College, who was afterwards archbishop of Canterbury, "so openly branded him for a Papist, or at least Popishly inclined, that it was almost made an heresy (as I have heard from his own mouth) for any one to be seen in his company, and a misprision of heresy to give him a civil salutation as he walked the streets."

In 1605 Laud had been appointed chaplain to Charles Lord Mountjoy, earl of Devonshire. Laud, who held marriage to be an indissoluble sacrament, who raised a flame in Scotland by enforcing this point, and who censured in the high commission, and even imprisoned for adultery (which imprisonment he himself allows in his diary to be more than the law allowed), nevertheless performed the rites of marriage between his patron and Lady Rich, whose husband was then living, and who had previously carried on an adulterous intercourse with Lord Mountjoy. On the death of the Earl of Devonshire in 1608, Laud was appointed one of the chaplains of Neile, then bishop of Rochester, from whom he obtained considerable church preferment. His patron Neile, on his being translated to the see of Lichfield, and before his giving up the deanery of Westminster, which he held in commendam with his bishopric of Rochester, obtained for him the reversion of a prebendal stall there. In 1611 he became president of St. John's College, Oxford.

In 1616 the king conferred upon him the deanery of Gloucester, having some time previously appointed him one of his chaplains in ordinary. In 1617 he accompanied King James into Scotland for the purpose of modelling the Scottish Church after the fashion to which he and Laud were desirous of bringing the Church of England. On the 22nd of January 1620 he was installed prebendary of Westminster, and on the 18th of November 1621 consecrated bishop of St. David's. It was expected that Laud would have been made dean of Westminster in the place of Williams, who having been sworn privy-councillor, and nominated to the see of Lincoln, received on the 10th of July the custody of the Great Seal on its being taken from Bacon. But Williams possessed such interest at court, that when he was made bishop of

Lincoln he retained his deanery in commendam, together with the other preferments which he held at that time.

Laud says, in his 'Diary,' that he resigned his presidentship of St. John's College, November 17, 1621, "by reason of the strictness of that statute, which I will not violate, nor my oath to it under any colour;" yet the king had given him leave to hold it; but in truth avarice was never one of Laud's vices. In May 1622 the conference between Laud and Fisher the Jesuit took place. It was held in the presence of the Marquis of Buckingham, who shortly after, as Laud himself informs us, "was pleased to enter upon a near respect to him, the particulars of which were not for paper." On the 15th of June he became 'C.' to Buckingham. It is thus he writes it in his 'Diary:' Some call it chaplain; others, among whom is Heylyn, confessor. It is certainly not usual for a nobleman even of the highest rank to have a bishop for his chaplain.

Laud was a great dreamer of dreams, and though he repeatedly affirms the contrary, he evidently attached much importance to them. The following extract from his 'Diary' is a specimen:—"December 14, Sunday night, I did dream that the lord keeper was dead; that I passed by one of his men that was about a monument for him; that I heard him say his lower lip was infinitely swelled and fallen, and he rotten already. This dream did trouble me."

The lord-keeper (Williams) had become jealous of Laud's growing favour with Buckingham, and he was incautious in betraying this jealousy. "January 11, I was with his majesty to show him the epistle that was to be printed before the conference between me and Fisher the Jesuit, Maii 24, 1622, which he was pleased to approve. The king brake with me about the book printed then of the visitation of the church. He was hard of belief that A. B. C. was the author of it. My lord keeper mett with me in the withdrawing-chamber, and quarrelled me gratis."

Laud's rise was now rapid. In 1626 he was made bishop of Bath and Wells, and dean of the Chapel Royal. On March 8th of this year he has the following entry in his 'Diary:'—"Dreamed that I was reconciled to the Church of Rome." In 1627 he was made a privy-councillor. On the 11th of July 1628 he says, "My congé deslier was signed by the king for the bishopric of London." About this time, on his acquainting the king with certain rumours spread abroad against him (Laud), Charles replied, "That he should not trouble himself with such reports, till he saw him forsake his other friends." On the death of Buckingham, Laud plunged completely into his political career. Charles now looked upon him as his principal minister. It was at this time that the close union commenced between Laud and Strafford.

Laud commenced his career of statesmanship with a zealous persecution of the Puritans, or religious sectarians. Leighton, a physician, having published a book against the bishops, called 'Sion's Plea,' was sentenced by the court of Star Chamber to have his ears cropped, his nose slit, his forehead stigmatised, and to be whipped. Between the sentence and the execution of it Leighton escaped out of the Fleet, but he was retaken in Bedfordshire, and underwent this atrocious punishment. In 1630 Laud was chosen chancellor of the University of Oxford. In 1632 he obtained for his creature Francis Windebanke the office of secretary of state; and in the same year Dr. Juxon was, he says in his 'Diary,' sworn dean of his majesty's closet—"That I might have one that I might trust near his majesty." Heylyn remarks on the above proceedings—"So that Windebanke having the king's ear on one side, and the clerk of the closet on the other, he might presume to have his tale well told between them; and that his majesty should not easily be prepossessed with anything to his disadvantage." On the 16th of August 1633 Laud was appointed archbishop of Canterbury: he has the following entry in his 'Diary:' "August 4. That very morning (of Abbot's death) there came one to me, seriously, and that avowed ability to perform it, and offered me to be a cardinal: I went presently to the king and acquainted him both with the thing and the person." "August 17, Saturday. I had a serious offer made me again to be a cardinal: I was then from court, but so soon as I came thither (which was by Wednesday, August 21), I acquainted his majesty with it. But my answer again was, that something dwelt within me which would not suffer that till Rome was other than it is." Laud made a declaration that in the disposition of ecclesiastical benefices he would give a preference to the single man over the married, 'ceteris paribus.' The close union between the English Church and the aristocracy appears to have commenced about this time.

Laud's letters to Wentworth, afterwards earl of Strafford, exhibit a more faithful mirror of the man's character than is anywhere else to be met with. His 'Diary,' though it bears sufficient impress of his peculiar spirit, discloses his character but imperfectly, particularly as there are many apparently important facts only hinted at, and names of which only the initials are given. The history of his troubles and trial, by himself, and the voluminous life by Heylyn, were expressly written to vindicate his conduct and character. In perusing the letters between Laud and Wentworth the reader feels as if allowed to be present at a confidential conversation between those personages. The letters of Strafford, along with many indications of a violent, arbitrary, overbearing temper, exhibit evidence of strength and sagacity, and sometimes even of greatness of mind. Of the last-mentioned

quality the reader will in vain search for any trace in the letters of the prelate. In courage and violence he did not yield to Strafford; but narrowness and littleness appear to have been the distinguishing characteristic of Laud's mind, and yet, contracted though his intellectual range was, some parts of his 'Conference with Fisher the Jesuit,' besides great scholastic learning, display considerable acuteness and no mean powers of reasoning.

On the 5th of February 1634, Laud was appointed one of the great Committee of Trade and the King's Revenue; and on the death of Weston, lord high treasurer, the management of the treasury was committed by letters patent under the great seal to certain commissioners, of whom Laud was one. In the year following Laud and the churchmen attained a very high, perhaps it may be said the highest point of their prosperity. Laud thus records the event in his 'Diary:'—"March 6, Sunday, William Juxon, lord bishop of London, made lord high treasurer of England: no churchman had it since Henry VII's time. I pray God bless him to carry it so, that the church may have honour, and the king and the state service and contentment by it; and now if the church will not hold themselves up under God, I can do no more." The following passage from a letter of the Rev. G. Gerrard, master of the Charterhouse, a correspondent of Strafford's, presents a lively picture of the state of feeling then prevalent among the clergy; it shows how near having an altogether ecclesiastical government England then was:—"The clergy are so high here since the joining of the white sleeves with the white staff, that there is much talk of having a secretary a bishop, Dr. Wren, bishop of Norwich, and a chancellor of the exchequer, Dr. Bancroft, bishop of Oxford, but this comes only from the young fry of the clergy; little credit is given to it, but it is observed they swarm mightily about the court."

On the 14th of June 1637 sentence was passed in the Star Chamber against Bastwick, Burton, and Prynne, for libels, as Laud informs us in his 'Diary,' "against the hierarchy of the Church." The archbishop does not however give any definition of what he meant by a libel against the hierarchy of the Church. Prynne's sentence was, to be fined 5000*l.* to the king, to lose the remainder of his ears in the pillory, to be branded on both cheeks with the letters S. L. for Schismatical Libeller, and to be perpetually imprisoned. The sentence of Bastwick and Burton was nearly similar. Most people thought these men's punishments sufficiently severe; not so the primate, as will appear from the following passage of a letter to Wentworth, of August 28th, 1637:—"I have received the copy of the sentence against Pater-son, and am verily of your lordship's mind, that a little more quickness in the government would cure this itch of libelling, and something that is amiss besides."

But the termination of Laud's career was now approaching. On the 18th of November, a few weeks after the meeting of the Long Parliament, he was impeached of high treason by the House of Commons, and committed to the Tower. It is impossible here to enter into the details of the archbishop's trial, of which he has himself written a full, and, on the whole, faithful account. ('History of his Troubles and Trial,' folio, London, 1695.) He defended himself throughout with courage and ability. The judges gave it to be understood that the charges contained no legal treason; whereupon the Commons changed the impeachment into an ordinance for his execution, to which the Lords assented. Laud produced a pardon from the king, which was disregarded. He was condemned and sentenced to death. The injustice as well as the illegality of this sentence is now admitted on all hands. Laud was beheaded on the 10th of January 1640-1.

It would be unjust to Laud not to mention his benefactions to learning. Besides making valuable donations of books and manuscripts to the University of Oxford, he founded in that university a professorship of Arabic in 1636, and endowed it with lands in the parish of Bray, in the county of Berks. His conduct to John Hales, known by the appellation of the 'ever-memorable,' is also recorded to his honour. Hales had written a short tract on schism, which was much at variance with Laud's views of church government: this tract had been circulated in manuscript. Hales, in an interview with Laud, refused to recede from his free notions of ecclesiastical power, but promised that he would not publish the tract. Laud conferred on him a canonry of Windsor.

LAUDER, SIR THOMAS DICK, Baronet, was born in 1784. He was the seventh baronet, and was the only son of Sir Andrew Lauder, the sixth baronet. He succeeded his father in the baronetcy in 1830. He became a contributor to 'Blackwood's Magazine' at its commencement, and furnished numerous articles to that periodical, and others. His first contribution to Blackwood, 'Simon Roy, Gardener at Dumphail,' attracted considerable attention, and was by some ascribed to the author of 'Waverley.' He also published in early life two novels, 'Lochandhu,' and 'The Wolfe of Badenoch.' His paper on 'The Parallel Roads of Glenroy,' which was read before the Royal Society of Edinburgh, and published in vol. ix. of their 'Transactions,' consists of a description of the geological strata of that district of the Highlands of Scotland. In 1830 Sir T. D. Lauder published an interesting 'Account of the Great Floods of August 1829 in the Province of Moray and the adjoining Districts,' 8vo, Edinburgh. In 1837 he published 'Highland Rambles, with Long Tales to shorten the Way,' 2 vols. 8vo, Edinburgh, and in 1841 'Legendary Tales of the High-

lands, 3 vols. 12mo. He also published a 'Tour round the Coasts of Scotland,' and a 'Memorial of the Royal Progress in Scotland' in 1842, 4to, Edinb., 1843. For the 'Edinburgh Tales,' conducted by Mrs. Johnstone, 3 vols. Edinb., 1845-46, he wrote the story of 'Farquharson of Inverey,' and 'Donald Lamont, the Braemar Drover.' Sir Thomas Dick Lauder married in 1808, and had issue two sons and seven daughters. He died May 29, 1848, at his residence, the Grange, near Edinburgh, and was succeeded by his son, Sir John Dick Lauder, who was born in 1813, and married in 1845. Sir T. D. Lauder was deputy lieutenant of the counties of Haddington and Elgin, and a Fellow of the Royal Society.

LAVATER, JOHN CASPAR, was born in 1741 at Zürich, where his father was a physician. The severity of his mother oppressed his youthful mind, and in his juvenile days he was remarkable for a fantastic solitary disposition, and an aversion to school. He soon discovered a decided tendency to religion, and in early years he had a great predilection for singing hymns and reading the Bible. He made no great progress in philological studies, but had an aptitude at expressing his thoughts and feelings which admirably qualified him for the office of clergyman. In 1763 he travelled through Leipzig and Berlin in the company of Fuseli, the subsequently celebrated painter, and to Barth in Swedish Pomerania to study theology under the celebrated Spalding. In 1764 he returned to his native town, and occupied himself with his duties as a preacher, with biblical studies, and poetical composition. The poems of Klopstock and Bodmer had produced an effect on his mind, and in 1767 he published his admired 'Swiss Songs,' and in the following year his 'Aussichten in die Ewigkeit' ('Prospects of Eternity').

In 1769 Lavater was made deacon of the Orphan house church at Zürich, where the extraordinary effect of his sermons, his blameless life, and benevolent disposition made him the idol of his congregation, while his printed sermons sent forth his fame to distant parts. His 'Physiognomic Fragments' appeared in 1775, in 4 vols. 4to, a work which has since been translated, abridged, and illustrated in every variety of form. In early life he had become acquainted with men of various characters, and had observed corresponding points of resemblance in the character of their mind and their features; and as he had a disposition to generalise particular observations as much as possible, he endeavoured to raise physiognomy to the rank of a science. He collected likenesses from all parts, made silhouettes of his friends, and the result of this pursuit was the celebrated work above mentioned. It is said that in after-life Lavater had less faith in physiognomy than at first. But whatever may have been the case with regard to his opinions on physiognomy, Lavater always firmly clung to his peculiar religious views, which were a mixture of new interpretations with ancient orthodoxy, and mystical even to superstition. One leading article of his faith was a belief in the sensible manifestation of supernatural powers. His disposition to give credence to the miraculous led him to believe the strange pretensions of many individuals, such as the power to exorcise devils, to perform cures by animal magnetism, &c. Some even suspected him of Roman Catholicism. Thus while his mystical tendency rendered him an object of ridicule to the party called the enlightened (*Aufgeklärte*), the favour he showed to many new institutions offended the religionists of the old school. However, many of the religious world, even of those not immediately belonging to his congregation, regarded Lavater with great veneration, and, opening a correspondence with him, looked to his letters as the great source of their spiritual consolation.

In the latter years of Lavater his writings were less esteemed; his poems were compared with those of more recent German writers, and lost by the comparison; while a free-thinking spirit was on the increase, which checked sympathy with his warm religious feelings. The beginning of the French Revolution Lavater regarded with pleasure; but his love changed to horror after the decapitation of the king. On the appearance of the revolution in Switzerland, he mounted the pulpit with the greatest zeal, and there, as well as in all public assemblies, declaimed against the French party with the utmost fervour and courage. When, on the 26th of September 1799 Massena took Zürich, Lavater, who was busied in the streets exciting the soldiery and aiding the sufferers, was shot by a grenadier. It is said that this grenadier was not one of the enemy, and that the act was that of an assassin; and it is further supposed that Lavater knew the man, but from a Christian spirit of forgiveness never betrayed him. He suffered a long time from this wound, but did not die till the beginning of 1801. During his illness he wrote some papers on the times and some poems, which are considered to be among his best productions.

LAVOISIER, ANTOINE-LAURENT, an eminent chemical philosopher, was born at Paris on the 16th of August 1743. His father, who was opulent, spared no expense in his education, in which he acquired at the College Mazarin a profound knowledge of astronomy, mathematics, botany, and chemistry. After some hesitation as to what particular science he should more particularly dedicate himself, he was determined in the choice of chemistry by the brilliant discoveries with which Dr. Black and others had then recently enriched that science. When only twenty-one years of age he obtained the prize offered by the government for the best essay on lighting the streets of Paris; and it is stated, that in order to enable himself to judge of the intensity of the light afforded by lamps, he kept himself

during six weeks in a room from which the light of day was entirely excluded. In 1763 he was admitted an associate of the French Academy, and finding that he incurred considerable expense in the prosecution of his chemical researches, he asked, and in 1769 obtained, the appointment of one of the farmers-general of the revenues, and his purse and his laboratory were equally open to the young inquirers in science. He was afterwards appointed to superintend the numerous saltpetre-works of France.

During the reign of terror Lavoisier was accused of having, as a farmer-general, mixed water and noxious ingredients with tobacco: to avoid arrest he secreted himself for some days; but hearing that his colleagues, and among them his father-in-law, were imprisoned, he voluntarily surrendered himself, and was condemned to death. In answer to a request for a respite of some days, in order to finish some experiments with which he had been recently engaged, and which he stated were of importance to the interests of mankind, he was coldly informed by the public accuser that the republic had no need of chemists, and that the court of justice could not be delayed. Deeply regretted by every man of science and by the numerous friends whom his amiable manners had attached to him, he was consigned to the guillotine on the 8th of May 1794, leaving a widow, who many years afterwards was married to Count Rumford.

His publications were numerous and highly important; for besides the larger works which we shall presently mention, he was the author of nearly sixty memoirs printed in the 'Memoirs' of the Academy, and other periodicals. His principal separate works are: 'Opuscules Chimiques et Physiques,' 2 vols. 8vo, 1775; 'Traité Élémentaire de Chimie,' 2 vols. 8vo, 1789; 'Instructions sur les Nitrières, et sur la Fabrication de Salpêtre,' 8vo, 1777.

In a posthumous and incomplete publication, consisting of two octavo volumes, entitled 'Mémoires de Chimie,' Lavoisier, alluding to the term commonly employed of the 'French theory,' claims it entirely and exclusively as his own; and although it will be impossible for us to enter minutely into a consideration of the Lavoisierian or antiplogistic theory, yet we shall state, from his 'Éléments de Chimie,' his peculiar views on some important subjects, and one of the first of these is the nature of heat. Having mentioned its expansive and repulsive powers, he says that "it is difficult to comprehend these phenomena without admitting them as the effects of a real and material substance, or very subtle fluid, which insinuating itself between the particles of bodies separates them from each other." He admits that the doctrine is hypothetical, but asserts that it explains the phenomena of nature in a satisfactory manner, and that considering it as the cause of heat, or the sensation of warmth, he at first gave it the name of 'igneous fluid,' and 'matter of heat,' but afterwards, in a work on chemical nomenclature by himself, Morveau, and Berthollet, he adds, "We have distinguished the cause of heat, or that exquisitely elastic fluid which produces it, by the term of caloric, without being obliged to suppose it to be a real substance, but as the repulsive cause which separates the particles of matter from each other." 'Free' caloric he defines to be that which is not united in any way with any other body; 'combined' caloric is that which is fixed in bodies by affinity or elective attraction, so as to form part of the substance of the body; and by 'specific' caloric of bodies he understands the respective quantities of caloric requisite for raising a number of bodies of the same weight to an equal temperature, and the proportional quantity depends on the 'capacity' of bodies for caloric.

His analysis of atmospheric air and the re-combination of its elements, though not quite correct, was nevertheless ably conceived and executed. He heated some mercury in a matrass connected with a glass receiver with about fifty cubic inches of atmospheric air; he then found that a portion of the mercury was converted into small red particles, which did not increase after the heat had been continued for twelve days; and he then observed that only about forty-two of the fifty cubic inches of atmospheric air remained unabsorbed, and this he found was no longer fit for respiration or combustion. On submitting the red particles of mercury to heat, they were separated into mercury and about eight inches of gas, which eminently supported both respiration and combustion; and having several times repeated the experiment, he mixed the residual unabsorbed portion of the air with that which was obtained by heating the red particles of mercury, and he found that air was reproduced precisely similar to that of the atmosphere, and possessing nearly the same power of supporting respiration and combustion. Lavoisier admits that the experiment does not show the exact quantity of the two airs which constitute the atmosphere, for he states that the mercury will not separate the whole of the respirable portion, and consequently part of it remains "united to the mercuria."

Lavoisier also mentions some experiments which he performed with this highly respirable air thus obtained by the intervention of mercury from the atmosphere, and he notices the brilliant effects of the combustion of charcoal and phosphorus, and adds, "This species of air was discovered almost at the same time by Dr. Priestley, M. Scheele, and myself. Dr. Priestley gave it the name of 'dephlogisticated air;' M. Scheele called it 'empyrean air;' I at first named it 'highly respirable air,' to which has since been substituted the term of 'vital air.'"

It is greatly to be regretted that so eminent a philosopher should

so far have forgotten what was due both to others and himself as to have made such a statement as this. It was one of the last acts of Dr. Priestley to publish, however unwillingly, that he first stated to Lavoisier himself, at his own table in Paris, in the year 1774, the fact of his having discovered this gas, in the presence of persons whom he names. Nor indeed is this the only instance, to use a gentle expression, in which Lavoisier exhibited a want of candour unworthy, not merely of a philosopher, but of a man. (See the 'Doctrine of Phlogiston established,' by Dr. Priestley, Northumberland, 1800.)

In 1778 Lavoisier published a paper in the Memoirs of the Academy, entitled 'General Considerations on the Nature of Acids, and on the principles of which they are composed.' In this paper it is attempted to be proved that all acids owe their properties to the presence of oxygen, and that when bodies were deprived of oxygen they lost their acidity. This doctrine of the universal acidifying power of oxygen was generally adopted until Davy proved that what had been called oxymuriatic acid had not been decomposed, and that with hydrogen it formed muriatic acid; he first however distinctly proved that certain bodies, such as carbon and sulphur, were actually converted into acids by the union with oxygen; but by a too hasty generalisation he was led to adopt principles which the further progress of science has proved to be untrue.

It is to be observed that Lavoisier did not discover any one of the elementary gaseous fluids. Mr. Cavendish had clearly described the properties of hydrogen before he began his career; and oxygen, azote, and chlorine were discovered, the two first in Britain and the last in Sweden, after Lavoisier commenced his chemical researches. In one particular case he indeed denies the existence of a well-known fact, namely, that gunpowder can be fired in vacuo; but then the fact is irreconcilable with his theory. The inquiries of Lavoisier, it must be added, had the principal share in introducing that reform in the nomenclature of chemistry which ended in the expulsion of the phlogistic theory. "Lavoisier's character," as Brander has truly stated, "has in some measure suffered by the misguided zeal of his admiring commentators, who, not satisfied with allowing him due merit for the logical precision and sagacity of induction which he brought into chemistry, have represented him as having the experimental activity of Priestley and the laborious diligence of Scheele. But Lavoisier, though a great architect in the science, laboured but little in the quarry; his materials were chiefly shaped to his hand, and his skill was displayed in their arrangement and combination."

LAW, EDMUND, D.D., Bishop of Carlisle, was born in 1703. He was the son of a clergyman in the northern part of Lancashire, and passed from the grammar-schools of that part of the kingdom to St. John's College, Cambridge. As soon as he had taken a degree he was elected Fellow of Christ's College, and in 1737 he was presented by the university to the rectory of Graystock in Cumberland. To this, in 1743, was added the archdeaconry of Carlisle, which brought with it the living of Salkeld, on the pleasant banks of the Eden. In 1756 he resigned his archdeaconry and returned to Cambridge, having been elected master of St. Peter's College.

In this, the first period of Dr. Law's life, he had published those writings which show at once the peculiar turn of his own mind, and have given him a place among the best and wisest instructors of their species. His first work was his translation of Archbishop King's 'Essay on the Origin of Evil,' with copious notes, in which many of the difficult questions in metaphysical science are considered. This was soon followed by his 'Enquiry into the Ideas of Space and Time,' &c. Both these works were produced before he left Cambridge; but it was in his retirement at Salkeld that he prepared his 'Considerations on the Theory of Religion,' with 'Reflections on the Life and Character of Christ,' a work of singular beauty, not to be read by any person without edification and improvement.

To his Cambridge appointment of Master of Peter House was soon added those of University Librarian and Professor of Casuistry. He was made archdeacon of Stafford, had a prebend given him in the church of Lincoln, and in 1767 one of the rich prebends in the church of Durham. The next year he was appointed to the bishopric of Carlisle.

In 1777 he published his edition of the works of Locke, with a life of the author. The peculiar character of Dr. Law's mind appears to have been acquired in a great measure by a devoted study of the writings of that philosopher. From him he seems to have derived that value which he set on freedom of inquiry, in relation to theological as well as to every other subject, which led him to take part in the great controversy respecting subscription, and which he freely exercised himself. The most striking proof of this is afforded in the edition of his 'Considerations,' printed in the latter part of his life at a press at Carlisle, in which are many important alterations. From Locke also he seems to have derived his notions of the proper mode of studying the Sacred Scriptures in order to come at their true sense. He was in short an eminent master in that school of rational and liberal divines which flourished in England in the last century, and is adorned by the names of Jortin, Blackburne, Powell, Tyrwhitt, Watson, Paley, and many others. Bishop Law died in 1787. He left a large family, of whom two of the sons became bishops, and another was the late Lord Ellenborough, the subject of the following notice.

This account of Dr. Law is derived from the most part from a notice

of his life by Archdeacon Paley, inserted in Hutchinson's 'History of the County of Cumberland.'

LAW, EDWARD, LORD ELLENBOROUGH, was born November 16, 1750, at Great Salkeld, in the county of Cumberland. He was the fourth son of Dr. Edmund Law, bishop of Carlisle. He received his rudimentary education at the residence of his maternal uncle, the Rev. Humphrey Christian, who then resided at Docking in Norfolk. He was removed thence in 1762 to the Charter-house School, London, and placed on the foundation. In 1763 he was entered of St. Peter's College, Cambridge. After taking his degree of B.A. he removed to London, and became a student of law at the Inner Temple. Having been called to the bar, and acquired by a short preparatory practice the needful technical knowledge, he soon took his place among the chief members of the profession. He was engaged as the leading counsel in the defence of Warren Hastings, 1788 to 1795, and in this famous trial acquired great distinction both as a lawyer and a speaker. In Westminster Hall he had Erskine and other able rivals to contend with, and never rose to the first lead as a pleader, but he became the admitted leader of the Northern Circuit. His rise in the profession was remarkably rapid. In 1801 he was appointed attorney-general and knighted, and in the same year he was elected a member of the House of Commons. In April 1802 Sir Edward Law succeeded Lord Kenyon as lord chief justice of the court of King's Bench, and was created a peer by the title of Baron Ellenborough, of Ellenborough in Cumberland, by patent dated April 10th, 1802. He was afterwards made a privy councillor. In the House of Lords in 1805 he strenuously opposed any concession to the Roman Catholics. On the trial of Lord Melville in 1806 Lord Ellenborough voted against him. In 1813 he was nominated one of the commissioners to inquire into the conduct of the Princess of Wales. In 1814 he was one of the judges who presided at the trial of Lord Cochrane [DUNDONALD, EARL OF], and in 1818 on the trial of Hone [HONE, WILLIAM]. In November of the same year he retired from the bench. He died December 13, 1818, at his residence in London. He married in 1782, and was succeeded in the title by his eldest son, who is now Earl of Ellenborough. [ELLENBOROUGH, EARL OF.] Lord Brougham, in his 'Historical Sketches of Statesmen,' makes the following remarks on his character as a judge:—"The Term Reports bear ample testimony to the vigour of this eminent individual's capacity during the eighteen years that he filled the first place among the English common-law judges. . . . He was somewhat irascible, and sometimes even violent. But no one could accuse him of the least partiality. His honest and manly nature ever disdained as much to trample overbearingly on the humble as to crouch meanly before the powerful. . . . He despatched business with great celerity, and for the most part with success. But causes were not sifted before him with that closeness of scrutiny, and parties were not suffered to bring forward all they had to state with that fulness and freedom, which alone can prevent misdecision, and ensure the due administration of justice."

LAW, JOHN, of Lauriston, was born about 1681 at Edinburgh, in which city his father exercised the trade of a goldsmith. His mother being heiress of an estate called Lauriston is the reason why, in conformity with the Scottish custom, Law is known by that name or title also. In very early life, in consequence of the reputation of possessing great talents, he was engaged to arrange the revenue accounts of Scotland, an employment which may have mainly contributed to fix his mind upon financial schemes. About this time he proposed the establishment of a bank which should issue paper-money to the amount of the value of all the lands in the country, thus confounding credit or security with currency, and imagining that the latter could never be in excess so long as the property which the paper issues were supposed to represent should be in existence. Law lost his father when he was little more than of age. He was handsome in person and of graceful carriage, fond of society and courted by it. Finding that his patrimony would not suffice for the supply of his extravagance, he had recourse to the gaming-table. During this career he fought a duel, and having killed his antagonist, he fled the country and visited Italy. His course of life must still have been very irregular, for it appears that he was banished successively from Venice and from Genoa, after which he wandered from one Italian city to another practising the arts of a gambler.

Law at length went to Paris, where he soon succeeded in ingratiating himself with the regent duke of Orleans, and in inculcating him with his plans of finance. By the persuasion of Law the first public bank of circulation was established by the regent in 1716, and its management was entrusted to the projector. This bank obtained the privilege for twenty years of issuing notes, which however were to be exchangeable on demand for coin of the established weight and fineness at the pleasure of the holder. The public debt of France at that time amounted to 1500 millions of livres, or about 70 millions sterling, and was so depreciated in the public estimation as to be unsaleable, except at 60 or 70 per cent discount. Law's bank was projected with the view of paying off this debt, by giving the public creditor the option of subscribing for bank shares and paying for the same in the public stock at par. With the view of inducing the public to purchase the bank shares, a patent, giving possession of the country of the Mississippi, under the name of Louisiana, which had been granted in 1712, to the Sieur Crozat, was purchased, and the Mississippi Company was formed,

with a capital of 100 millions of livres, and allied to the bank, having secured to it for twenty-five years the sole right of trading to that quarter, and also of prosecuting the Canada beaver trade. Still further to assist the scheme, the receivers-general of taxes were directed to make all their payments in the paper of the bank. With all these advantages it was yet a long time before the favour of the public was so far gained that the subscriptions amounted to 100 millions of livres.

In 1718 the Mississippi Company had the entire farming or monopoly of tobacco granted to it for nine years, and thereupon sent great numbers of planters, artificers, and labourers to Louisiana. In the following year the French East India Company and the Senegal Company were both incorporated with the Mississippi Company, which then enjoyed the monopoly of the trade of France "from the Cape of Good Hope eastwards to all the other parts of Africa; to Persia, India, China, Japan, and the Isles, even to the Straits of Magellan and Le Maire." The prospect of advantages to be derived from these various sources soon began to operate upon the public; and such numbers crowded forward to make investments in the stock of the Mississippi Company, that in August 1719, its price was driven up to 500 per cent. It may serve to show the feverish state of excitement then prevalent to state, that on the rumour of Law being seized with illness, the stock fell from 500 to 445 per cent., and that his convalescence raised it again to 610 per cent. In the month just named the general farm of all the public revenues was granted to the Company, all of whose privileges were by the same arrêt prolonged to the year 1770, in consideration of which concessions the Company agreed to advance to the government, for paying off the public debt, 1200 millions of livres, about 50 millions sterling at 3 per cent. A further sum of 50 millions of livres was paid by the Company for the exclusive privilege of coining during nine years. In a few weeks the stock rose in price to 1200 per cent., when 150 millions of livres were added to the capital by fresh subscriptions at 1000 per cent., and, to take every advantage of the existing mania which had seized all classes, the new capital was divided into very small shares. By this means the Company was enabled to lend to the government an additional sum of 300 millions of livres at 3 per cent. In the midst of all this speculation, the bank having issued notes to the amount of 1000 millions of livres, upwards of 40 millions sterling, there was such an abundance of money afloat, that the prices of all commodities rose exorbitantly, and land was sold at fifty years' purchase. At this time Law was considered to be a man of so great consequence, that his levee was constantly crowded by persons of eminence from all parts of Europe, who flocked to Paris that they might partake of the golden shower. "I have seen him," wrote Voltaire, "come to court, followed humbly by Dukes, by Marshals, and by Bishops." Indeed such was his influence at court that the English ambassador Lord Stair having resented his arrogance, the English government found itself under the necessity of recalling Lord Stair, though his services had been of the greatest importance and such as to secure the full approbation of his own court.

From November 1719 to the following April, the price of Mississippi stock continued to rise until it reached 2050 per cent. On the 21st of the following month a royal arrêt appeared, which suddenly produced an entire revulsion in the public feeling. Under the pretence of a previous depreciation of the value of the coin, it was by this arrêt declared necessary to reduce the nominal value of bank-notes to one-half, and of the actions of the India or Mississippi Company from 9000 to 5000 livres. It is not possible adequately to describe the calamitous effects produced throughout France by this step. The bank-notes could no longer be circulated at more than one-tenth of their nominal value; and the parliament having represented the fatal consequences of the arrêt, another was issued, stating that "the king being informed that his reduction of bank-bills has had an effect quite contrary to his intention, and has produced a general confusion in commerce; and being desirous to favour the circulation of the said bank-bills for the conveniency of such as give or take them in payment, and having heard the report of the Sieur Law, he has ordained that bank-bills be current on the same footing as before the above arrêt, which he hereby revokes."

The charm was however broken. This and ten other arrêts which were issued in the course of a month from its date, could not restore the confidence of the public. Law found it prudent to retire from the management of the public finances, and for his personal protection a guard was assigned to him. Many prudent persons applied themselves earnestly to realise their property, and to send it for safety to other countries, which proceeding occasioned the issue of a royal ordonnance, in which such a course was forbidden upon pain of forfeiting double the value, while all investments in the stocks of foreign countries were prohibited on the like penalty. By these means the public alarm was carried to its height. The bank-notes being generally refused in all transactions of business, an arrêt appeared forbidding any person to refuse them, under penalty of double their nominal value; and this occasioning a still greater run upon the bank, another arrêt was issued on the same day, ordering the bank "to suspend the payment of its notes till further orders."

By these proceedings many thousands of families, once wealthy, were suddenly reduced to indigence; and Law, who was the original con-
coctor, and had been the chief instrument in carrying out these va-

financial delusions, was obliged to quit France with an inconsiderable fortune, the wreck of what he might at one time have realised: he resided for some time in different places in Germany, and settled at length at Venice, where he died in 1729.

In 'A Discourse upon Money and Trade,' which he wrote and published in Scotland, Law has left a record of the flattering but visionary views which led him to his financial schemes.

LAW, WILLIAM, the author of various works of practical and mystical divinity, was born in 1686 at King's Cliff in Northamptonshire. We should have known little of Law, probably, had it not happened that he was for some time living in the family of Mr. Gibbon, father of the historian Gibbon, which leads to the introduction of some valuable notices of his life, habits, and opinions, in the beautiful fragment of 'Autobiography' which the historian prepared. William Law went to Cambridge with a view of entering the Church, took the degrees of B.A. and M.A., was of Emanuel College, and in 1711 was elected a Fellow. On the accession of King George I, he refused to take the oaths prescribed by act of parliament, and in consequence vacated his fellowship. It was soon after this that he entered the family of Mr. Gibbon, who resided at Putney. Here he continued several years, and his connection with the family became perpetuated to his death in consequence of a design which Miss Hester Gibbon, the sister of the historian, formed and executed, of retiring from the world in company with her friend Mrs. Elisabeth Hutcheson, and living a life of charity and piety, with Mr. Law for their chaplain. They fixed upon King's Cliff, the place of Mr. Law's birth, as the spot to which they retired; and there Mr. Law lived the last twenty years of his life, dying April 9, 1761.

Mr. Law was the author of various works, in which he recommends the exercise of a piety which approaches to the character of ascetic, and which it is almost impossible for any one to practise who is not in a great degree relieved from the necessity of attention to the ordinary business of life. The most popular of them is entitled 'A Serious Call to a Devout and Holy Life,' a work containing many passages of great beauty, and many spirited sketches of various characters to be found in the world, which has had great influence on many minds, and might awaken a proper spirit of seriousness in all. Dr. Johnson said of this work, that it first led to his thinking in earnest of religion. Law was a disciple and ardent admirer of Jacob Böhme (BÖHME, JACOB), and his writings are strongly imbued with the sentiments of that remarkable man. Law contemplated editing an English version of the works of Böhme, and the edition of 'The Works of Jacob Behmen,' 4 vols. 4to, 1764, bears the name of Law on the title-page, but it is certain that he had nothing to do with its preparation, though some of his marginal notes appear to have been used: the first volume did not appear till three years after Law's death. Law did however incorporate and elucidate the philosophy of Böhme in his 'Way to Knowledge,' the next in importance of his works to his 'Serious Call,' as well as in his 'Way to Divine Knowledge,' 'Spirit of Love,' and in his 'Letters.'

LAWES, HENRY, a composer to whom English music is much more indebted than its two historians seem to have been inclined to admit, was a native most probably of Salisbury, of which cathedral his father was a vicar-choral. He was born in the year 1600, as appears from an inscription under his portrait, now in the episcopal palace of that city. Lawes received his professional education under John Cooper, an Englishman, who having travelled and studied in Italy, thought fit to Italianise his names, and is generally mentioned as Giovanni Coperario. In 1625 Lawes was appointed one of the gentlemen of the chapel, and afterwards clerk of the cheque to Charles I. In 1633, in conjunction with Simon Ives, he produced the music to a masque presented at Whitehall by the members of the four Inns of court, under the direction of such grave personages as Noy, the attorney-general, Hyde, afterwards Earl of Clarendon, Whitelocke, Selden, &c., and received one hundred pounds for his share in the business. About the same time he composed the music to Milton's 'Comus,' which was performed at Ludlow Castle in 1634. He was well acquainted with the best poets of his time, and set many of their verses to music, particularly Waller's. He also lived much with persons of rank, whose poetical effusions were, in abundance of instances, made vocal by the notes of Lawes. These appear in the publications of his time, but chiefly in his three sets of 'Ayres and Dialogues for One, Two, and Three Voices,' published in 1653, 1655, and 1669, comprising about 150 songs, duets, and trios, printed in 'lozenge' notes, in type of an indifferent kind, with no accompaniment but an unfigured base, and therefore not very appreciable in the present day except by tolerably good harmonists, who to musical knowledge add some acquaintance with the style of our old music and its notation.

Lawes continued in the service of Charles till the king's death. He then had recourse to teaching, in which pursuit his time was much occupied, for his superior taste and ability, his good sense and gentlemanlike manners, occasioned his instructions to be eagerly sought after. At the Restoration he resumed his places in the chapel-royal, and composed the anthem for the coronation of Charles II. He died in 1662, and his remains were deposited in Westminster Abbey.

From the cold language in which Hawkins and Burney speak of Henry Lawes, and more especially from the disparaging expressions

of the latter, we are much disposed to think that neither was acquainted with the beat of his productions. The song in 'Comus'—'Sweet Echo'—inserted by Hawkins, is a very poor specimen of his genius. Had either of those historians looked carefully into his three books of airs, &c., they could not but have found enough to convince them of his invention and judgment; enough to prove that the encomiums of contemporary poets, especially Milton, himself an expert musician, were sincere and deserved. How beautifully in 'Comus' does the great poet allude to his friend's compositions, where, speaking of him as 'The Attendant Spirit' (a character personated in the masque by the composer himself), he says—

"Thyrs! whose artful strains have oft delay'd
The huddling brook to hear his madrigal,
And sweeten'd every musk-rose of the dale."

And in his thirteenth sonnet, addressed to Lawes, beginning—

"Harry, whose tuneful and well-measur'd song,"

he bears honourable testimony to the moral worth and judgment of the musician, which, he says, distinguished him "from the throng." The opinion of Waller is not less favourably and strongly expressed; and Herrick, in his 'Hesperides,' is almost enthusiastic in praise of the great English composer; for it is a gross mistake to suppose that Lawes adopted the style of the Italian music fashionable in his time. In a preface to his first book he defends himself against the charge of imitation; and an impartial comparison of his best airs with those of his foreign contemporaries will not only prove him to be an original composer, but that the English in his time, and indeed long after, could boast a school of music peculiarly their own.

LAWES, WILLIAM, brother of the preceding, was educated under the same master, and for a time also held the situation of gentleman of the chapel. During the civil wars he entered the royalist army, and had the rank of captain; but with a view to his personal safety, Lord Gerrard made him a commissary. Disdaining however the security offered, he was killed at the siege of Chester in 1645. The king was so much affected by his loss, that he expressed his sorrow in remarkably strong terms, and even went into mourning for his self-devoted servant. William Lawes was an able musician; he composed much for voices and instruments, as well as many excellent part-songs, rounds, &c., which are to be found in the publications of the day. In Boyce's 'Collection' is an anthem of his, which puts him on a level with most of the church composers of his time. But his chief work is a collection of Psalms for three voices, set to the well-known paraphrase by Sandys.

LAWRENCE, SIR THOMAS, was born at Bristol, May 4th, 1769. His father had been brought up to the legal profession, which he however never followed. Of a somewhat improvident and unsettled disposition, he tried various avocations without much success in any. He had married a beautiful and accomplished young lady, daughter of the Rev. W. Read, vicar of Tenbury; and he at length obtained, through the interest of an aunt of Mrs. Lawrence, the office of supervisor of excise at Bristol, which he resigned soon after the birth of his son Thomas—the youngest of sixteen children, most of whom died in infancy—and became landlord of the White Lion Inn. Not succeeding at Bristol, Mr. Lawrence in 1772 was enabled by his friends to become landlord of the Black Bear at Devizes, where he remained till 1779. This inn was at that time much frequented by the rich and fashionable, who resorted to Bath, and generally stopped at Devizes. It was here that young Lawrence manifested that decided predilection for the art in which he subsequently attained such eminence. He drew striking likenesses with the pencil and pen while a child in petticoats. He was likewise remarkable for the feeling and taste with which he recited poetry, in which he had been trained by his father, who never failed to introduce him to his guests, who were delighted both with his genius and his extraordinary personal beauty. It was in 1775, when he was only six years old, that Mr. (afterwards Lord) Kenyon and his lady had their portraits in profile taken by the infant artist. They were deficient in force, but the execution is said to have been extremely easy and spirited, and the likenesses accurate. Very soon after this event he was sent to a highly respectable school, kept by Mr. Jones, near Bristol, but he was removed when only eight years old; and this was all the regular education that he ever had.

In 1779 Mr. Lawrence failed, and was obliged to leave Devizes, whence he went to Weymouth. In 1782 he settled at Bath, and placed his son for a time as a pupil under Mr. Prince Hoare, a crayon painter, of much taste, fancy, and feeling, from whom young Lawrence acquired that grace, elegance, and spirit, which qualified him to be so pre-eminently the painter of female beauty. At the age of thirteen he received from the Society of Arts the great silver pallet, gilt, with an additional present of five guineas, for a copy in crayons of the 'Transfiguration.' Sir Thomas frequently declared that this honour had given a great impulse to his enthusiastic love of the art. Nor did he confine himself to portraits. At the age of nine he copied historical pictures in a masterly style, and at the age of ten ventured on original compositions of the highest order, such as 'Christ reproving Peter for denying him,' 'Reuben requesting his Father to let Benjamin go to Egypt,' 'Haman and Mordecai,' &c.

At length in 1787 Lawrence's father resolved to bring his son to

London, and took apartments in Leicester-square. He was soon introduced to Sir Joshua Reynolds, who gave him good advice and encouragement, and always received him with kindness. It was in the same year (1787) that he first exhibited at Somerset House, where seven of his pictures, all female portraits, were admitted. From that time his fame and his practice rapidly increased, though he had some formidable competitors, one of whom was Hoppner, who was patronised by the Prince of Wales. In 1791 he was chosen Associate of the Royal Academy, or rather, being under the age (twenty-four) fixed by the laws of the institution, he was elected a 'Supplemental Associate,' being the only instance of the kind which has occurred; and his election is said to have been owing to the strongly-expressed wish of George III. In 1792 George III. appointed him to succeed Sir Joshua Reynolds as principal painter in ordinary, and the Dilettanti Society unanimously chose him for their painter. From that time forward every exhibition at Somerset House offered fresh proofs of his talents. Yet these pictures were but a small portion of those which he executed.

We cannot dwell on particulars, but we must not pass over the honourable commission which he received from King George IV. (then Prince-Regent) to paint the portraits of the sovereigns and the illustrious warriors and statesmen who had been the means of restoring the peace of Europe. He commenced his labour in 1814 with portraits of the King of Prussia, Blücher, and Platoff, who were then in England. In April 1815 the Prince conferred the honour of knighthood upon him. In 1818 he proceeded to the Congress of Aix-la-Chapelle, thence to Vienna, and in May 1819 to Rome, where his magnificent portraits of Pope Pius and of Cardinal Gonsalvi were enthusiastically admired. The collection of portraits executed in obedience to this commission is now in the Waterloo Hall at Windsor Castle. "Among so great a number of portraits," says Dr. Waagen, "all cannot be equal in merit. I was particularly pleased with those of the Pope, Cardinal Gonsalvi, and the Emperor of Austria. Besides the graceful and unaffected design, the clear and brilliant colouring, which are peculiar to Lawrence, these are distinguished by greater truth of character and a more animated expression than is generally met with in his pictures." The praise here given to Sir Thomas Lawrence is just, but it is not complete: he possessed the happy talent of idealising his forms, without departing from nature or destroying the likeness; but he was very deficient in the higher qualities of portraiture, and it is a great descent to pass from his portraits of eminent statesmen and warriors to those by Vandyck or Reynolds.

In speaking of the portraits of Sir Thomas, his admirable portraits of beautiful children deserve especial notice, the engravings from some of which are universally known. Though Sir Thomas had in his childhood attempted historical compositions which gave ample promise of future excellence, he was so absorbed by portraits that he had no time to devote any adequate attention to historical painting. Some of his pictures of the Kemble family may indeed be almost considered as historical; and in 1797 he exhibited at Somerset House a picture of 'Satan calling his Legions,' after Milton, which he himself considered as one of his best works, but which, now that the influence of fashion and partisanship has passed away, is generally considered to be a work which displays rather the daring than the greatness of the artist.

While Sir Thomas was absent on the Continent, Mr. West, the venerable president of the Academy, died in March 1820, and Sir Thomas was chosen without opposition to succeed him. He returned in April, loaded with honours and presents which he had received abroad, to meet with equally flattering distinctions at home, which he continued to enjoy without interruption till his death, which took place at his house in Russell-square, on the 7th of January 1830, in the sixty-first year of his age.

Though Lawrence had no school education, he had acquired a considerable fund of various and extensive knowledge: he was even tolerably conversant with the general literature not only of his own country, but of the rest of Europe. His addresses to the students of the Royal Academy were full of good advice, and delivered with a kindness of manner which proved his sincere wishes for their welfare and success. To the merits of his brother artists, whether dead or living, he was ever just, and no feeling of envy or jealousy seems to have ruffled the innate benevolence of his mind. It might have been expected that he could not fail to accumulate a large fortune, but as this was not the case, ever-busy calumny was ready to accuse him of gambling, a vice to which he was so far from being addicted, that he renounced billiards, in which he greatly excelled, because, as he said, "Though I never played for money, my play attracted much attention, and occasioned many and often very high bets. Next to gambling itself is the vice of encouraging it in others, and as I could not check the betting, I have given up my amusement." Very early drawbacks for the assistance of his family, a style of almost extravagant living at the outset, an utter carelessness of money (as he himself says), extensive assistance to artists less fortunate than himself, and, above all, the vast expense of procuring that unrivalled collection of drawings by the great masters which was so unhappily dispersed since his death, are sufficient to account for his not growing rich. His portraits are in every collection. As already noticed, his portraits of the statesmen of Europe are in the Waterloo Gallery at Windsor. Fine portraits by him are in the National Gallery, three of them, 'John Kemble as

Hamlet,' 'Mrs. Siddons,' and 'Benjamin West,' being usually regarded as among his best works.

* LAWRENCE, WILLIAM, an eminent living surgeon. He received his early education at St. Bartholomew's Hospital, in which institution he served his apprenticeship, and in due course of time was advanced to the position of assistant surgeon and surgeon. Mr. Lawrence became early known by his devotion to the study of anatomy and physiology; and in 1815 was appointed Professor of Anatomy and Surgery to the Royal College of Surgeons of England. In 1816 he published 'An Introduction to Comparative Anatomy and Physiology,' being the two introductory lectures delivered at the Royal College of Surgeons, London. In 1819 he resigned this appointment. It was during the time he held this post that he delivered his celebrated 'Lectures on the Physiology, Zoology, and Natural History of Man.' These lectures excited great attention at the time they were published, not only on account of the novelty of the matter, but also for the popular and pleasing style in which they were written. At the time this work was published, comparatively little had been done to place physiology upon the basis of the other inductive sciences, and it consisted of a mass of generalisations more or less supported by facts. Many of the views published in this work, and which drew a great amount of attention to it, have since been modified or retracted by the author. These views not only provoked the notice of the theologian and the general public, but even the profession itself, and led the author into angry controversies with his professional brethren. A sixth edition of this work was published in 1834. The bent of his genius also at this time may be seen in his translation of Blumenbach's 'Manual of Comparative Anatomy,' which was published in London in 1827. His appointment however at St. Bartholomew's Hospital, and the position of Lecturer on Surgery in the school connected with the College, prevented his further cultivation of the natural sciences, and his subsequent works are entirely devoted to professional subjects. Although the name of Mr. Lawrence is not connected with the advancement of any special department of surgical science, there are few men who have written more extensively on surgical subjects, and to whom during the present century surgery is more indebted for its advancement. His accurate knowledge of anatomy has been the primary cause of the success of his surgical works. Of these the following may be regarded as the most important:—'Anatomico-Chirurgical descriptions and views of the Nose, Mouth, Larynx, and Fauces,' London, folio; 'Anatomico-Chirurgical views of the Male and Female Pelvis,' London, folio; 'A Treatise on Venereal Diseases of the Eye,' 8vo, 1830; 'A Treatise on Ruptures,' 8vo, 1833; 'A Treatise on Diseases of the Eye,' 1841. His treatises on the diseases of the eye are of considerable value, as the result of a large experience as surgeon to the London Ophthalmic Hospital, a post which he has now resigned, but which he filled for many years. Mr. Lawrence is also author of numerous papers in the 'Transactions' of the Royal Medical and Chirurgical Society of London, and in various weekly medical journals. The 'Lancet' has also published a complete set of his lectures on surgery, and numerous chemical lectures on cases occurring in the wards of St. Bartholomew's Hospital.

In the early part of his career Mr. Lawrence was distinguished for his advocacy of medical reform. He was the determined opponent of the corrupt system of appointment which was then prevalent in most of the London hospitals; and some of the most vigorous and caustic articles on these subjects in the 'Lancet' are now known to have been written by him. The principles which he advocated are now silently making their way; and the position which he now holds as President of the Royal College of Surgeons is an indication of the change which has taken place in public opinion on the question of medical organisation.

Mr. Lawrence was made a Fellow of the Royal Society in 1813. He is a member of the Academies of Science of Göttingen, Stockholm, and Copenhagen, of the American Philosophical Society, and the National Institute of America. He is also a foreign associate of the Royal Academy of Medicine of Paris, a corresponding member of the Royal Academy of Medicine of Belgium, and of the Medico-Chirurgical Society of Berlin.

* LAYARD, AUSTEN HENRY, M.P., is the eldest son of H. P. J. Layard, Esq., of the civil service in Ceylon, whose father, the Rev. Dr. Layard, well known as the learned and accomplished Dean of Bristol, claimed descent from an ancient and noble family in France who emigrated on account of the revocation of the Edict of Nantes. Austen Layard was born in Paris, March 8th, 1817, during the temporary stay of his parents in that capital. Having passed a considerable portion of his youth at Florence, where he imbibed an early taste for literature and the fine arts, and perfected his skill as a draughtsman, he came to England with the intention of studying for the law, but soon abandoned the idea, and in 1839 set out on a tour through Germany and Russia to Constantinople and Asia Minor. Having spent some time in the East, during which he adopted the dress and manners of the countries in which he lived, he acquired a perfect knowledge of the Turkish and Arabic languages. In 1840 or 1841 he transmitted to the Geographical Society a diary of his journey from Constantinople to Aleppo, which has never been published; the eleventh volume of the 'Proceedings' of that society however contains an account of a journey performed by him in 1840, in the company of Mr. Ainsworth.

Having gone on to Persia, he designed to examine the remains of Susa; and though in his journey thither he was robbed of his watch and mathematical instruments, yet he recovered his property by his influence with the eastern chiefs. His discoveries at Susa were not very satisfactory in their results, if we except that of the tomb of Daniel. In 1842 and the following year he remained in Khurdistan, an elaborate description of which country he forwarded to the Geographical Society. Having made himself as familiar with these parts as he already was with Asia Minor and Syria, he desired to penetrate into the regions of the East, and to dispel the dark cloud which had hung so long over the history of Assyria and Babylonia. Having made a minute inspection of the ruins at Nimroud, he with the aid of Sir Stratford Canning (now Lord Stratford de Redcliffe), the British ambassador at the Porte, set about excavating the site. These excavations were carried on by Mr. Layard in conjunction with M. Botta, the French consul, whose government showed itself far more ready than the English government to encourage these scientific labours. Mr. Layard's discoveries too, it should be remembered, were carried on under other great discouragements; he had to contend with the superstition of his Arab labourers, and the avarice and caprice of the Pasha of the district, who constantly interrupted his proceedings under one and another pretence until, through the influence of Lord Stratford de Redcliffe, he obtained a firman from the Sultan, authorising him to prosecute his work and remove the sculptures. Yet when he had secured possession of these stupendous remnants of antiquity, it was with the greatest difficulty that the British government were induced to defray the cost of their transmission to England. Eventually however the point was conceded, and, as steamers are unable to ascend the Tigris, the sculptured monuments were floated down the river upon rafts formed of inflated skins as far as Baghdad, where they were placed on board of vessels ready to transport them to England.

By Mr. Layard's exertions the interesting history of the Assyrian kingdom is now read in the architectural designs and sculptures in bas-relief which adorned the palaces of Nimroud and Koyunjik, both of which sites he excavated with the greatest care. The treasures which he brought back to England from Nimroud have been placed in the British Museum, and a complete account of them will be found in his work entitled 'Nineveh and its Remains,' 2 vols. 8vo, London, 1849, embellished with engravings from his own drawings. Mr. Layard also prepared to accompany this work a series of illustrations in imperial folio, entitled 'Monuments of Nineveh, illustrated by 100 Engravings;' and subsequently a second series appeared, with 70 additional plates; together with a volume of 'Inscriptions,' in the cuneiform character, for the British Museum. His work contains not merely a narrative of his excavations and of the various incidents which befell him in the prosecution of them, but also an investigation into primitive Assyrian history, so far as the scantiness of his materials admitted. The subject is a vast study, and is considerably illustrated by the monuments brought to England and deposited in the British Museum. Dr. Layard observes that "Nineveh had been almost forgotten before history began." The classical authors of antiquity write of that vast city and its records as of an all but fabulous kingdom. Even Xenophon was puzzled when he saw their mighty ruins. The history which Herodotus either wrote or promised to write (i. 106, 184) is lost; so that, as it is observed by a contemporary writer, "until Dr. Layard's recent labours, a man might have carried all that remained of Nineveh and Babylon in a little hand-box." While the discoveries of Mr. Layard go far to confirm by incidents of more or less importance the records of sacred and profane historians, they have also established beyond a doubt that, before what we call ancient civilisation dawned, an earlier civilisation on a gigantic scale had passed away, the more perfect and beautiful in proportion as it becomes the more remote in date. The earliest of these ancient sculptures are invariably the most correct and severe in form, the most noble in design, and most exquisite in finish and execution.

At the close of the year 1848 Mr. Layard returned to Constantinople as attaché to the embassy there, and in the following year resumed his excavations at Nineveh, where he remained until 1851. The results of this second visit to the East he gave to the world in 1853, in a second work entitled 'Discoveries in the Ruins of Nineveh and Babylon, with Travels in Armenia, Kurdistan, and the Desert.'

For a few months in 1851 Mr. Layard held the office of under-secretary of state for foreign affairs under Earl Granville, and at the general election of 1852 he was returned to parliament as member for Aylesbury. The University of Oxford conferred on him the honorary degree of D.C.L. in 1848, and in February 1856 he was unanimously elected Lord Rector of the University of Aberdeen. He had not long entered parliament before he acquired distinction as a debater, while his energy and practical talents were generally acknowledged. It is understood that he has refused more than one offer of ministerial employment, but that he has hitherto declined them from conscientious motives and a wish to be independent of party. He visited the Crimea while the British army was before Sebastopol in 1854, and was one of the chief instruments in obtaining a committee of inquiry into the state of the British army before Sebastopol in the early part of 1855.

LEACH, WILLIAM ELFORD, was born at Plymouth in the year 1790. He was first educated at Plympton Grammar School, but was afterwards removed to Chudleigh, a school which at that period enjoyed

much local repute. Though not noticed as idle, his inclination was shown at this early period more in the pursuit of external objects than in the attentive study of his school books. Both at Plympton, and afterwards at Chudleigh, he was in the constant habit of storing up material of supposed interest, and forming collections of natural objects, in which he never failed to secure the co-operation of his schoolmates. These juvenile collections fixed the study of natural science early in his mind, and induced him to choose the profession of medicine as facilitating him in its progress. In pursuance of this idea he was apprenticed to the Devon and Exeter Hospital in the year 1807. Here he distinguished himself among his fellow pupils for the skill with which he performed the minor operations in surgery, as also for the general gaiety of his disposition and the energy and determination of purpose he evinced in whatever he undertook.

In 1808 he went to London, where he entered at St. Bartholomew's Hospital, Abernethy at the time being at the head of its medical school. In 1809, after only a single year's study, he obtained the diploma of the Royal College of Surgeons. He then proceeded to Edinburgh to complete his studies. While there he laid before the Wernerian Society one or two papers on comparative anatomy and zoology, and such was his zeal and reputation as a successful student that the degree of M.D. was conferred upon him at the completion of his second year, a very remarkable honour, and one rarely granted. But Dr. Leach is known not as a physician but as a naturalist, and as such we must contemplate his history; and in the whole field of science no more zealous or industrious student ever laboured. He was deterred by no difficulty, yielding to neither fatigue of mind or body. From Edinburgh he proceeded to London to take charge of the natural history department of the British Museum; and here to appreciate Dr. Leach's labours it would be necessary to review the state of the natural sciences, and zoology in particular, at the commencement of the present century, at a length which cannot be brought within the space allotted to this notice.

The artificial system of classifying objects invented by Linnæus was at this time prevalent throughout Europe, but the defects were becoming increasingly perceptible in every part of natural history, but mostly so in the lower forms of zoology. It was in France that the first opposition to the artificial system was commenced by Daubenton and Pallas, whose immature labours were speedily followed by those of Lamarck and Cuvier. But while zoology was making rapid strides on the Continent there were few in England who followed up the path thus opened to them, there being a general repugnance to anything that appeared like an innovation on this system. Leach was among the first who appreciated the natural arrangement which had so long guided the continental zoologists; and for the introduction of which into this country we are mainly indebted to him. He not only pursued the path which others had opened, but he advanced the subject by his individual researches, and produced the first movement towards weaning his countrymen from the school to which they had too long adhered.

He pursued his labours at the British Museum with a zeal scarcely to be surpassed, and won the esteem and confidence of all with whom he was brought into contact. One of the first results after his appointment was the publication of the 'Zoologist's Miscellany,' a continuation of the irregular serial commenced by Mr. Shaw his predecessor, under the name of the 'Naturalist's Miscellany.' This work Leach continued until 1817, and completed three volumes. Although his duties required his attention to be given to the whole of the animal kingdom, yet at this time in particular he laboured chiefly at the Articulata, the results of his residence upon the coast of Devonshire directing his attention more particularly to the Crustacea, to which class of animals he added many new discoveries. In 1813 he published an article 'On Crustaceology,' the arrangement of which he revised and corrected in a paper in the 'Transactions of the Linnean Society,' the chief feature in which was the separation of the Myriopoda, Arachnides, and Insecta from the Crustacea, the whole of which previously had been arranged by Linnæus under *Insecta*, while Latreille and Lamarck had grouped the Myriopoda with the Arachnides.

In 1815 appeared the first part of the 'History of the British Crustacea' entitled 'Malacostraca Podophthalma Britannica.' Seventeen numbers containing forty-seven plates only appeared. It is to be regretted that any circumstances should have precluded from completion a work that, even in its imperfect state, has become a standard in natural history. At different times Leach was elected Fellow of all the more important societies in Europe and America, and communicated a large number of papers to their various Transactions. He was also author of the article on Carcinology in the 'Dictionnaire des Sciences Naturelles,' and in 'Mélanges Zoologiques.'

Independent of the desire of knowledge, a love towards the animals themselves formed a marked feature in his character, which induced a reciprocal feeling in those he petted, exhibited in the power to tame the most savage beasts or poisonous viper, with either of which he would play with impunity. It was his constant habit at one time to have with him a wolf of very ferocious temper, but which always obeyed and followed him in his walks about the city, and, on one occasion while in Paris it remained waiting for three hours at the

entrance of the Jardin des Plantes, with the fidelity of a common dog, while its master went into the grounds.

Leach was of a thin spare figure, and possessed an intelligent and expressive countenance, which was improved by a pair of most piercing black eyes; his manner was engaging, and his conversation earnest and convincing, and when on the subject of his favourite studies, enthusiastic. The result of this temperament was manifest in the unwearied industry at his labours. Late at night and early in the morning Leach was always to be found at work, and about the year 1817 he was often not in bed for the night. The consequence of his severe labours exhibited itself first in the injury the use of the microscope entailed upon his sight, which induced amaurosis. This in a short time was followed by a more serious illness, which precluded him from pursuing, except at irregular intervals for amusement, what had been the ambition of his life. He therefore retired from the curatorship of the natural history department of the British Museum and with it closed his scientific career.

He returned to the neighbourhood of Plymouth, where he continued until 1826, when he proceeded to the south of Europe. During his sojourn in Italy he industriously collected the insects of the localities in which he resided. The collection is preserved in the Museum of the Plymouth Institution and Devon and Cornwall Natural History Society. Although benefited by the warm climate of the south, his health never recovered from the shock his constitution had sustained, and when the cholera visited Europe he was among its early victims. Dr. Leach died August 25th, 1836, at St. Sebastiano in Piedmont.

LEAKE, ADMIRAL SIR JOHN, was born at Rotherhithe in 1656. He was bred to the sea, and from 1677, when he fought in Sir E. Spragge's action with Van Tromp, to the end of the century, served with high credit in various stations; more especially he distinguished himself in the battle of La Hogue. Being in command on the Spanish coast during the War of the Succession, he obtained much honour by the skill and gallantry which he displayed in relieving Gibraltar, first in October 1704, secondly in March 1705. In the same year he bore an active part in the reduction of Barcelona, which again he relieved in April 1706, when besieged by the Spaniards and French, and in great extremity. In the same year he commanded the fleet at the capturing of Alicant, Carthagena, and the island of Majorca, and in 1708 of Sardinia and Minorca. After the death of Sir Cloudesley Shovel in 1707, Sir John Leake was made commander-in-chief of the fleet, and in 1709 rear-admiral of Great Britain, on which occasion the queen paid him the high compliment that "she was put in mind of it by the voice of the people." In the same year he became a lord of the Admiralty, and continued high in office until the death of Queen Anne. Being superseded on a pension on the accession of George I., he spent the rest of his life in retirement, and died August 1, 1720, leaving a high professional reputation for skill, courage, prudence, and success. His private character is represented in a very amiable light. (*Life of Admiral Leake*, by his grandson, S. M. Leake, 1750.)

LEAKE, LIEUTENANT-COLONEL WILLIAM MARTIN, a distinguished investigator of the antiquities of Greece, entered the Royal Artillery, and rose to the rank of lieutenant-colonel. He resided four years in the Turkish provinces of Greece and Albania, where he was employed by the British government on a special mission. He commenced his travels in Asia Minor in January 1800. In 1805 and subsequently he travelled in the Morea, where he made two journeys, and in Northern Greece, where he made four journeys, which were not strictly consecutive to those in the Morea, though his accounts of them were afterwards published as a continuation. He returned to England about 1810, and in 1814 published 'Researches in Greece, Part I., containing Remarks on the Modern Languages of Greece,' 4to. In 1821 he published 'The Topography of Athens, with some Remarks on its Antiquities,' 8vo, with plates in 4to; 2nd edit. 1841. In 1823 he retired from the army, but was allowed to retain his military rank. In 1824 he published the 'Journal of a Tour in Asia Minor, with Comparative Remarks on the Ancient and Modern Geography of that Country,' 8vo, accompanied by a Map; and in 1826 'An Historical Outline of the Greek Revolution, with a few remarks on the present state of affairs in that Country,' 12mo. In 1827 was published a 'Mémoire sur les Principaux Monumens Égyptiens du Musée Britannique, et quelques autres qui se trouvent en Angleterre, expliqués d'après le Système Phonétique, par le Très Hon. Charles Yorke et le Colonel Martin Leake,' 4to, London, with many engravings in outline. In 1829 he read before the Royal Society of Literature an elaborate paper 'On the Demi of Attica.' His 'Travels in the Morea' with a Map and Plans, 2nd edit. 3 vols. 8vo, 1839, was followed by 'Travels in Northern Greece,' 4 vols. 8vo, 1835. In 1846 he published 'Peloponnesiaca, a Supplement to the Travels in the Morea,' 8vo; in 1851 a pamphlet entitled 'Greece at the End of Twenty-Three Years' Protection,' 8vo; and in 1854 'Numismata Hellenica: a Catalogue of Greek Coins collected by William Martin Leake, F.R.S., one of the Vice-Presidents of the Royal Society of Literature, with Notes, a Map, and Index,' a thick vol. in 4to. This very elaborate work is dedicated to his wife, "to whose zeal and perseverance," he says, "I am mainly indebted for the completion of the present Catalogue, and whose skill in the most delicate processes of electrotype has enriched the collection with between 500 and 600 of the rarest coins."

The researches of Colonel Leake into the ancient state of Greece, its geography and topography, as compared with the modern state, prosecuted during a series of years, and embodied in his *Travels*, comprise a mass of information of the highest value, and must continue to form a basis for whatever yet remains to be done towards completing our knowledge of the interesting subjects which have so long occupied his attention.

LEBRUN (or LE BRUN), CHARLES, an eminent French painter, was born at Paris in 1619. His father was an indifferent sculptor. The son, manifesting an early talent for drawing, was placed under the care of Simon Vouet. He however went to finish his studies at Rome, where he spent six years, during which time he diligently applied himself, under the guidance of Poussin, to acquire a thorough knowledge of the antique, and of the works of Raffaele and other great masters. Lebrun had a comprehensive genius, improved by profound study of history and of the manners of different nations. Few painters were better acquainted with the influence of the passions on the countenance, as is shown in his 'Traité sur la Physionomie,' and 'Sur le Caractère des Passions;' nor has he had many superiors in invention. With a lively imagination he combined great facility of execution, and he aimed at the greatest correctness, especially in the costume and details. His colouring, particularly in the flesh, is indifferent, retaining too much of the school of Vouet; his light and shade are often not happily distributed, and his foregrounds are generally deficient in force. His great merit obtained him the favour of Louis XIV., who appointed him his principal painter, president of the newly-erected Academy of Painting and Sculpture, and director of the Gobelins manufactory, conferred on him the order of St. Michael, and frequently visited his studio while he was engaged on the battles of Alexander, the best known and most admired of all his works: the engravings from these well-known works give a favourable idea of his abilities, and of the elevated though too artificial style of his composition and design. Lebrun died at Paris in 1690, at the age of seventy-one.

LEDOUX, CLAUDE-NICOLAS, was born at Dormans, in the department of the Marne, in 1736. He quitted the college of Beauvais at the age of fifteen, and went to Paris, where he at first gained his livelihood by engraving; but an irresistible inclination led him to the study of architecture, with the principles of which he made himself acquainted in Blondel's 'Cours.' His prepossessing person and engaging address procured for him opportunities of displaying his talents, and he knew so well how to turn them to account that Madame Dubarry appointed him her architect in 1771. It was for her that he erected the elegant pavilion De Louveciennes, and the Château de St. Vrin, near Arpajon. His high favour in that quarter not only established his celebrity with the public, but immediately procured for him numerous commissions, both in the capital and the provinces. In Paris he built an hotel for Count d'Halleville; in the Rue Michel le Comte, that of the Prince de Montmorency; and, besides several others, the Hôtel Thelusson, remarkable for the vast bridge-like gateway towards the street. One of the best of his provincial buildings was the Château de Benonville, near Caen. But it was the Barrières of Paris that afforded him an opportunity of abandoning himself to his fancy; and considering the period of their erection, they certainly display considerable originality, though much of that is questionable in taste; and they have for the most part the appearance of being merely first ideas and sketches, carried at once into execution without having been revised and matured. The same remark applies to the large folio volume he published, consisting of a treatise on architecture, illustrated by designs, which, though they display much originality, are not a little extravagant. He died of a paralytic attack, on the 19th of November 1806, at the age of seventy.

* LEDRU-ROLLIN, PHILIPPE, Minister de l'Intérieur during the Lamartine government of France in 1848, was born at Mans in 1807, or, according to other accounts, at Paris in 1808. His family name was Ledru; that of Rollin was added after having been called to the bar. Young Ledru had the advantage of a sound education, after which he studied for the law, was received as an advocate in 1832, just before the riots of that year, and in 1833 published a spirited memorial, in which he condemned as illegal and unconstitutional the state of siege in which Paris was then placed. Vehement in language and rather imperious in tone, this first pamphlet placed him in the front rank of the ultra-liberal party, to which he has ever since adhered with undeviating consistency. He had inherited a considerable private fortune, which probably gave him as much weight with his party as his patriotic sentiments and his unquestionable talents as a pleader.

In 1834 a serious insurrection burst out nearly at the same time in the capital of France, at Lyon, and other chief cities. In Paris it was attended with much slaughter, chiefly in the Rue Transnonain. Ledru-Rollin made this event the subject of a new pamphlet, which was written in that style of declamation and apostrophe so well calculated among an easily excited people to extend the popularity of public men. Shortly afterwards he married an Irish lady, who is supposed to have brought him a considerable fortune. During a course of sixteen years' practice (1832 to 1848) few advocates were so often retained at the French bar to defend political prisoners. In the 'affaire Quenisset' (September 13th, 1841), having been retained as counsel by M. Dupaty, editor of the 'Journal du Peuple,' accused as

an abettor in the abortive attempt at insurrection, his long and animated appeal was much admired. M. Garnier-Pagès, the elder, one of the most popular deputies, having died (June 23rd, 1841), the name of Ledru-Rollin occurred to the majority of the constituency as his successor: he was elected shortly after, and took his seat among the members of the extreme left. In the Chamber of Deputies he became the constant advocate of the extension of the franchise—the whole number of voters for parliamentary representation in France scarcely amounting to a quarter of a million in a population of 33,000,000. Independent of his orations in the Chamber, and of his attendance and pleadings in the law courts, he contributed many articles to the 'Réforme' newspaper, and to the 'Journal du Palais,' both of which partly belonged to him.

During the year 1847, the agitation for electoral reform increased every month; a great change was felt to be approaching, and Ledru-Rollin was seen everywhere as one of the principal agitators. In the summer and autumn of that year a series of political dinners were given, under the name of Banquets, in the large towns, all of which he attended, and over many of which he presided. At the famous Banquet de Lille, when many of the leaders of his party shrank from the danger, he took the chair, and denounced with the most bitter invectives the conduct of Guizot and his government. It was on this occasion that the king's health was omitted among the toasts of the day.

The revolution of February 1848 brought Ledru-Rollin into his most prominent position. On the 24th of that month he took a leading part in the movement, indignantly repudiated the proposal of a regency, and then suggested and carried the motion of an appeal to the people. When the Chambre des Députés was invaded by the multitude, only his voice and that of Lamartine were listened to. He afterwards led the way to the Hotel-de-Ville, assisted to construct the Provisional Government, and received the portfolio of Minister of the Interior, with a commission to republicanise France. It was then he began to organise his corps of itinerant commissioners, who overran the departments, and filled the republic with dismay. Assuming the position of Danton, and really possessing some of the powers of that great agitator, he let loose a second time upon the people of France all the wildest theories of 1789. Finally, as a natural consequence of so much excitement, came the sanguinary insurrection of June, which was suppressed by Cavaignac, but not before it had dissolved the government of Lamartine, after an unquiet rule of four months. Ledru-Rollin immediately took his place in the ranks of the Socialists and Communists; and, supported by these sects, he was elected by several departments as their representative to the Legislative Assembly. He was one of the candidates for the presidency; and on the 10th of December 1848 he obtained 371,431 votes, whilst Louis-Napoleon Bonaparte numbered 5,534,520, Cavaignac 1,448,302, and Lamartine 17,914 only. During the month of May 1849 his invectives against the government of Louis-Napoleon became so frequent and so bitter that most men expected a new movement. On the 13th of June 1849 an attempt was made to provoke the people of Paris to an insurrection, and Ledru-Rollin, in order to escape being apprehended, fled, and sought refuge in England. He has since resided in this country. In 1850 he published his 'Decline of England,' a work containing severe censures upon that country, not dictated by a candid spirit or grateful feelings.

LEDYARD, JOHN, a remarkable person in the history of geographical discovery, was born at Groton in Connecticut, and educated at Dartmouth College, New Hampshire. Having lost his father, and being apparently friendless, he had not the means, if he had the wish, to follow up his studies. Some years he spent among the Indians, a good school of preparation for his future toils. He worked his passage from New York to London in 1771 as a common sailor; and in 1776 sailed with Captain Cook, on his third voyage, in quality of corporal of marines, and was with him when he was murdered; and some years later wrote an interesting account of this voyage. While thus engaged he conceived the bold scheme of traversing the unknown regions of America, from the neighbourhood of Nootka Sound to the eastern coast; and so earnest was he, that being frustrated in his design of reaching the western shore of America by sea, he set out from England towards the end of 1786, with ten guineas in his pocket, hoping to reach Kamtchatka, and thence effect a passage to America. According to Tucker's 'Life of Jefferson,' this scheme was suggested to Ledyard by Mr. Jefferson, then the American minister at Paris, who assisted him with money. He traversed Denmark and Sweden, passed round the head of the Gulf of Bothnia, after an unsuccessful attempt to cross it on the ice, and reached St. Petersburg in March 1787, without money, shoes, or stockings, having gone this immense distance on foot in an arctic winter. At St. Petersburg he obtained notice, money to the amount of twenty guineas, and permission to accompany a convoy of stores to Yakutsk in Siberia. But for some unexplained reason he was arrested there in January 1788, by the order of the Empress Catharine, while waiting for the spring, and conveyed to the frontier of Poland, with a hint that he would be hanged if he re-entered Russia. He found his way back to England, after suffering great hardship. Still his adventurous spirit was unbroken; and, almost without resting, he eagerly closed with the proposal of the Association for promoting the discovery of the

inland parts of Africa, to undertake a journey into that region. There is a characteristic story, that on being asked how soon he could be ready to set out, he replied, "To-morrow morning." He left London, June 30, 1788; and travelling by Marseille and Alexandria, reached Cairo August 19. The ardent, persevering, intelligent spirit of inquiry shown in his first and only despatches raised high expectation of the value of his labours; but these were cut short by his premature death, in that city, of a bilious disorder on the 17th of January 1789. His route was to have been from Sennaar westward, in the supposed direction of the Niger, so that he would have crossed that great continent in its widest part. From his scanty education and mode of travelling, Ledyard probably would have contributed little to scientific knowledge; but his keenness of observation, vigour and endurance, mental and bodily; and indifference to pain, hardship, and fatigue, fitted him admirably for a geographical pioneer; and his death, the first of many lives sacrificed to African discovery, excited a strong feeling of regret. "I have known," he said, shortly before leaving England for the last time, "hunger and nakedness to the utmost extremity of human suffering. I have known what it is to have food given as charity to a madman; and I have at times been obliged to shelter myself under the miseries of that character, to avoid a heavier calamity. My distresses have been greater than I have ever owned, or ever will own, to any man. Such evils are terrible to bear, but they never yet had power to turn me from my purpose."

*LEE, FREDERIC RICHARD, R.A., was born near the close of the last century at Barnstaple, Devonshire, a county which has contributed an unusually large proportion of names to the list of eminent English painters. Mr. Lee did not however in the first instance adopt painting as his profession. It was not indeed until he had seen some service in the army that he laid down the sword and took up the pencil. But having adopted landscape painting out of a real love of the art, and a hearty enjoyment of nature, he made rapid progress and soon attracted attention. From the first his pictures were marked by a direct reference to nature, and perhaps the circumstance of his turning to painting as a profession after his general tastes were formed may have done something to preserve him from the too common habit of looking to the works of previous painters for guidance rather than to nature: at any rate his pictures remind one often of Constable's rule for the landscape painter,—“when painting your picture forget every other picture.” Mr. Lee began to exhibit at the Royal Academy in 1824, but he had previously exhibited at the British Institution, where he had gained one of the prizes (50*l.*) then occasionally awarded there. Mr. Lee has painted pretty nearly every kind of native scenery, but, as might be expected from an ardent fly-fisher, he has shown a preference for the river or the loch. And it is in river scenery, as we think, his strength especially lies. The broad open moorland with the distant hills, or the wild and rugged mountain tract, he paints with much force, but from want of appreciation, apparently, of the atmospheric phenomena which play so important a part in such scenes, and also from the not having acquired a thorough mastery over mountain form, he is, in these subjects, far from being so successful as in his rivers. So in the sea views which he has of late painted rather frequently, his success is far from complete. His rocks are wanting in variety and grandeur of form, his rolling seas are often poor in colour, and without freedom, life, and elasticity. But in his river scenes, whether 'The Watering Place,' or 'The Ford,' 'The Fisherman's Haunt,' 'The Mill,' or 'The Broken Bridge,' so that there is a sandy bank, with above it a mass of dense foliage, and below a stream, whether sluggish or rapid, clear, or "in spate," he is at his ease, and paints with a firm, free, crisp touch, and a well-filled pencil, and never fails to impart to the spectator a large share of the pleasure he has evidently felt himself. Only inferior to his river scenes are his admirably painted "Avenues," of which those at Northwick, Sherbrooke, and Penshurst, are well known. But wherever he can make trees the chief object of his picture, he is sure to produce a picture which it is a pleasure to look at. And equally pleasing are such fresh homely scenes as his 'Village Green,' 'Harvest Field,' 'Ploughed Field,' a 'Devonshire Village,' or a 'Devonshire Lane.' Perhaps among the best pictures by English painters working in union are those of which Mr. Lee has painted the landscapes and Mr. Cooper the cattle and horses, pictures which never fail to win very general admiration at the Academy Exhibitions.

We spoke of Mr. Lee as a painter of native scenery. He is in fact one of our most thoroughly British landscape painters. His earlier pictures were mostly taken from the rivers and lanes of his native Devonshire, or about Penshurst Park—always a favourite haunt of his—or else by the Yorkshire Wharfe, a favourite haunt of every true lover of English river scenery. The Highlands formed his next great sketching field, and subsequently he turned to North Wales, the river scenery of which, as may be supposed, he wandered along with thorough enjoyment, and painted with genuine zest. Lincolnshire on the one side, and Cornwall on the other, have served to vary the range of his subjects, but the places first enumerated have furnished the staple. Beyond our own little island he has never gone for inspiration. Mr. Lee has been a most industrious painter. From his connection with the Royal Academy—he was elected A.R.A. in 1834, R.A. in 1838—not an exhibition has passed which has not contained several pictures by him. A general favourite, the pictures of Mr. Lee

are to be found in almost every private collection. The National Gallery we need not say has none. In the Vernon Collection is a choice specimen of his early manner, the 'Cover-Side,' in which the dogs and keepers were painted by Landseer, and a 'Scene on the Lincolnshire Coast.'

LEE, NATHANIEL, was born in the latter part of the 17th century. He was educated at Westminster School, and afterwards went to Trinity College, Cambridge. A passion for the theatre led him to appear as an actor on the London stage, but he met with no success. He wrote however thirteen tragedies, of which two, 'Alexander the Great,' and 'Theodosius,' remained favourites for a long time, though the first alone is now remembered. A derangement of mind led to Lee's temporary confinement in Bedlam, and though he was released, he did not long enjoy his liberty. He died at the age of thirty-four, in 1691, having, as Cibber supposes, been killed in a night ramble. Some recent critics, while admitting the bombast that pervades the works of Lee, ascribe it to a wild and powerful imagination; but his inflated words and thoughts are too often merely common-places dressed up in extravagant language. The imagination of Lee, such as it is, is seldom under his own control, and frequently is little better than a sort of arithmetical exaggeration. The author has brought together a number of impossible characters, uttering sometimes hardly a single word of true feeling, or a phrase in good taste; and the reader consequently not only feels no interest, but finds it difficult to repress a smile at the woes of the gaudy heroes and heroines. But in judging of his poetry it is proper to bear in mind his mental and physical misery, the quantity of verse he wrote, and the early age at which he died.

LEE, REV. SAMUEL, D.D., was born May 14, 1783, at Longnor, a village in Shropshire, about eighteen miles from Shrewsbury. He received the rudiments of education at a charity-school in that village, where at the age of twelve years he was apprenticed to a carpenter and joiner. At the age of seventeen he formed a determination to learn the Latin language, and though he had at first only six shillings a week, and afterwards seven, to subsist on, he contrived to buy rudimentary books and then classical writers, and by the end of his apprenticeship had accomplished his purpose. He then determined to learn the Greek, and this he also accomplished. The Hebrew, Chaldaic, and Syriac languages were next mastered. When in his twenty-fifth year he removed into Worcestershire to superintend on the part of his employer the repairing of a large house, in which however a fire broke out, when he lost all his tools, and was reduced to extreme poverty. In the meantime the Rev. Archdeacon Corbett had heard of his studious habits, saw him at Longnor, lent him books, and assisted him in pronunciation. In the course of a few months he acquired the Arabic and Persian languages, and afterwards a tolerable knowledge of French, German, and Italian. For two or three years previously to 1813 Mr. Lee held the mastership of Bowdler's foundation school in Shrewsbury. In 1813 he left Shrewsbury, and obtained an engagement with the Church Missionary Society. In the same year he entered himself of Queen's College, Cambridge, and in 1817 took his degree of B.A. Having received ordination, he preached in the following year at Shrewsbury a sermon in aid of the funds of the Shropshire Auxiliary Bible Society.

On the 11th of March 1819 Mr. Lee was elected Arabic Professor of the University of Cambridge, but not having been at college the time requisite for taking his degree of M.A. (which was necessary before he took the chair), a grace passed the senate to request the Prince-Regent to grant a mandamus, which was obtained accordingly. In 1822 the University of Halle conferred on him, without solicitation, the degree of D.D. In 1823 he was appointed chaplain to the jail at Cambridge, and in 1825 was presented to the rectory of Bilton with Harrowgate. He took the degree of B.D. in 1827, and in 1831 was elected Regius Professor of Hebrew to the University of Cambridge, and with it obtained the accompanying canonry in the cathedral of Bristol. The degree of D.D. was conferred upon him by the University of Cambridge in 1833. He was afterwards presented to the rectory of Barley in Hertfordshire. He died on the 16th of December, 1852, at Barley rectory. He was twice married.

Among the more important of Dr. Lee's works are the following:—'Hebrew Grammar,' 1830; 'Travels of John Batuta, translated from the Arabic,' 1833; 'The Book of Job, translated from the original Hebrew,' 1837; 'Hebrew, Chaldaic, and English Lexicon,' 1840; 'An Inquiry into the Nature, Progress, and End of Prophecy,' 8vo, Cambridge, 1849; 'The Events and Times of the Visions of Daniel and St. John, investigated, identified, and determined,' 8vo, London, 1851. Besides these works, Dr. Lee published several pamphlets on subjects of religious controversy, sermons, and contributions to periodical literature.

LEE, SOPHIA AND HARRIET, were the daughters of John Lee, a performer at Covent Garden Theatre in the last century. Harriet was born in 1756; Sophia was a few years her senior. Soon after their father's death they opened a school at Bath. In this undertaking they acquired a moderate competence, upon which they retired to Clifton, where both died, Sophia on March 13, 1824, and Harriet on August 1, 1851, aged ninety-five. Sophia first appeared in 1780 as author of a comedy, 'The Chapter of Accidents,' which was performed at the Haymarket with considerable success. Her next work was 'The Recess,' which appeared in 1785 in three volumes, one

of the first so-called historical novels, a somewhat lachrymose tale of the adventures and calamities of a supposed daughter of Mary of Scotland, by a marriage with the Earl of Leicester, which contains as little of history either in the facts of the tale or in the depicting of the manners of the age, as in any resemblance to the characters of the personages introduced, but which obtained a considerable share of popularity from the attempts at pathos and sentiment with which it is full. In 1787 she published 'The Hermit's Tale,' a poem; in 1796 'Almeida, Queen of Granada,' a tragedy, which was successfully performed, Mrs. Siddons sustaining the principal character. In 1804 was published in six volumes, a novel entitled 'The Life of a Lover,' which is said to have been her earliest production, the effort of her girlish years, and is certainly one of her weakest writings. Her last work was a comedy, performed at Drury Lane Theatre in 1804, called 'Assignment,' which was condemned on the first night, and was never published. Her chief claim to notice, like that of her sister, rests on the 'Canterbury Tales,' of which she furnished two, 'The Young Lady's Tale,' and 'The Clergyman's Tale,' which occupy a volume and a half of the five volumes to which the series extended; and the introduction to the whole. These tales are certainly superior to her novels, but they are not equal on the whole to those of her sister.

Harriet's first appearance as an author was in 1786, when 'The Errors of Innocence,' a novel in five volumes, was published; this was followed in 1787 by a comedy, 'The New Peerage; or, Our Eyes may deceive us,' 'Clara Lennox,' a novel in two volumes, in 1797, and 'The Mysterious Marriage, or the Heirship of Rosalva,' a play, in 1798: all have been forgotten. The 'Canterbury Tales' were published in successive volumes, the first in 1797, the fifth and last in 1805; they were so immediately popular that second editions of the first two volumes were published in 1799. They consist of twelve tales, of which one, 'The German's Tale—Kruitznor,' furnished Lord Byron with the idea and some of the materials for his tragedy of 'Werner,' and he says of the tale that he had formed a "high estimate of the singular power of mind and conception which it develops." It is undoubtedly the most powerfully interesting of the whole, contains the most definitely drawn characters, and a well-developed plot. Several of the other tales however show a considerable knowledge of the human mind, are unexceptionably moral, generally pleasing, and are narrated in a simple and unaffected style.

LEECH, JOHN, was born in London and educated at the Charterhouse. The pages of 'Punch' have rendered the name of Leech one of the best known and most highly-prized among English caricaturists. Week after week and year after year has his pencil there given an enduring shape to some one or other of the current follies. From the paterfamilias (whom he especially delights in following into his domestic retirement or watching in his recreations) to the most juvenile of the rising generation, Mr. Leech has suffered no member of the 'domestic circle' to escape his keen pencil. The sober citizen—immortal 'Mr. Briggs,' the fast young man; young ladies whether fast or moderate in pace, and their grave mammas; the 'juvenile branches' of every age; the smart serving maids and their 'followers,' with all the mysteries and miseries of the 'domestic arrangements,' are displayed with as little reticence and evidently from as extensive an experience as though narrated by the ever-memorable Caudle. This is perhaps the peculiarity of Leech as a pictorial humourist, that he has made common every-day household life and ordinary home characters the chief subject of his pencil: and that he has done it pleasantly, without cynicism, and in the spirit of a good-tempered laughing satirist—one might almost say philosopher: and further, that it has almost invariably been a folly at which he has despatched his shaft. As works of art the sketches of Mr. Leech (taking of course into account the rapidity with which they were thrown off and the purpose for which they were made) are of a high order. They exhibit rare powers of observation, and remarkable facility of execution; great skill in drawing (though often drawn carelessly enough, sometimes perhaps from haste, and sometimes it may be from choice); and a singular aptness in rendering expression, or (what is no less difficult to express happily) the absence of expression. The artist-like power with which he sketches in with a few rude-looking scratches a landscape background is equally admirable, and so in fact is the cleverness with which the accompaniments—whether the sketch be of an 'interior,' or an out-door scene,—are made to assist the story.

Mr. Leech has illustrated several of Albert Smith's tales, the 'Comic History of England,' &c., and published under his own name, 'The Rising Generation,—a series of Twelve Drawings on Stone,' fol., 1848; and 'Pictures of Life and Character: from the Collection of Mr. Punch; 500 woodcuts,' oblong fol., 1854—this last being probably the most remarkable collection (even as to mere quantity) of humorous sketches ever published by so young a man.

LEFEBVRE, FRANÇOIS-JOSEPH, Duke of Danzig, and Marshal of France, was born of humble parents, at Ruffach, in Upper Alsace, on the 25th of October 1755. He was designed for the ecclesiastical profession, but having lost his father, he enlisted, when eighteen years of age, as a private soldier in the regiment of French guards. He had attained the rank of serjeant-major when, on the breaking out of the French revolution, that regiment was dissolved. He continued to serve however, and in 1792 he became a captain of his regiment. In that capacity he was enabled to render some valuable assistance

to the unfortunate family of the dethroned King Louis XVI., and on two occasions he gallantly interposed in their behalf, and, at the peril of his life, rescued them from an infuriated populace. His subsequent rise in the army was without precedent rapid, even at that period: on the 3rd of September 1793, he became adjutant-general; on the 2nd of December, in the same year, he was a general of brigade; and on the 10th of January 1794, he rose to the rank of a general of division. While serving with the army of the Moselle, he distinguished himself at the combat of Lambach, and in the battle of Giesberg. During the whole of the campaign in Germany and the Netherlands, under Pichegru, Moreau, Hoche, and Jourdan, he made himself conspicuous for his skill and courage. In 1796, when the French army under General Kléber had passed the Rhine [KLÉBER], the Austrians, finding themselves compelled to retire from Uckerath, had intrenched themselves, twenty thousand strong, on the heights which surround the small town of Altenkirchen. Their formidable position was attacked on the 4th of June by Kléber, who formed his army into two divisions, the first of which, the advanced-guard, he placed under Lefebvre. The brunt therefore of the assault fell on that division, which boldly charged the enemy at the point of the bayonet, and, in spite of a most vigorous resistance, compelled them to retire in disorder, leaving behind them four standards, twelve pieces of cannon, and about three thousand prisoners. On the 25th of March 1799, was fought the memorable battle of Stockach, in which Lefebvre acquired fresh renown; with only eight thousand men he resisted, for many hours, the attack of thirty thousand Austrians.

At the time when Bonaparte was placing himself at the head of affairs, the Directory, who supposed Lefebvre devoted to their cause, appointed him to the command of the guards of the Legislative Assembly; but, on the morning of the 18th Brumaire (October 14), he attended the meeting of officers at Bonaparte's private residence, and cordially co-operated in their proceedings. He was also instrumental in extricating Lucien Bonaparte from his dangerous position in the stormy meeting of the Council of Five Hundred at St. Cloud. [BONAPARTE, NAPOLEON I.; BONAPARTE, LUCIEN.] These important services were rewarded by the command of the seventeenth military division, whose head-quarters were at Paris. In 1804 he was raised to the dignity of a Marshal of the Empire. He accompanied Napoleon the following year in the Austrian campaign, and in 1806 took an active part at the battle of Jena, where, though at that time upwards of fifty years of age, he fought on foot at the head of the guards.

In 1807 he was sent with an army of sixteen thousand men to invest Danzig, which was garrisoned by twenty thousand troops, besides a numerous militia, and the investment was completed on the 14th of March. A body of twelve thousand Russians were advancing to the relief of the besieged, and Lefebvre was compelled to divide his force, and to detach a portion of them to oppose the Russians. On the 15th of May a severe action took place between them and the French, when the latter, seconded by the troops of Marshal Lannes and General Oudinot, who had been sent by the emperor to their assistance, successfully repelled nine Russian regiments, and a part of the Prussian garrison by whom they had been joined. On the 21st of May, preparations having been made for a general assault, the Prussian commander General Kalkreuth offered to accept terms of capitulation, and Lefebvre willingly accorded favourable terms. A few days after these events, Napoleon, who was desirous of reviving the high nobility in France, and to give additional lustre and more munificent rewards to the twenty-four grand dignitaries whom he had lately created, made Lefebvre Duke of Danzig. The siege of Danzig indeed was one of the most brilliant triumphs of the Prussian campaign, and consequently well fitted to give an honourable title to the general who had conducted it. Eight hundred pieces of cannon and immense magazines fell into the hands of the conquerors, and the capture of this important fortress not only secured the left flank and rear of Napoleon's army, but left to Prussia only the stronghold of Pillau along the whole coast of the Baltic.

In 1808 Lefebvre joined the Peninsular expedition, and was appointed to the command of the fifth corps of the French army. On leaving, the emperor had given him directions to keep the Spaniards in check till his arrival; but when employed in the province of Biscay, finding that the enemy were seriously harassing the flanks of his army, he gave them battle, and on the 1st of November triumphantly entered the town of Bilbao. His conduct however on that occasion appears to have given displeasure to Napoleon, as it interfered with his plan of operations. He was afterwards present at the battle of Tudela, where he had the command of the cavalry. [LANNES.] In the German campaign of 1809 he rendered himself conspicuous as a brave soldier and an excellent tactician, at the battles of Eckmühl and Wagram, and in the dangerous warfare among the passes of the Tyrol. He was also with Napoleon in the disastrous expedition to Russia, and had the command of the old guard, which was however seldom called into action; but during the retreat he showed considerable military skill, and, for the most part, accompanied his corps on foot, sharing every suffering and exposing himself to every danger in common with the private soldiers.

During the campaigns of 1813 and 1814 he appears faithfully to have adhered to the declining fortunes of his master; and after the battle of Leipzig, when the remnants of the French army were called

to fight for the defence of their native country, by none of his lieutenants was Napoleon more ably seconded than by Lefebvre. At the battles of Champ-Aubert (February 10, 1814), at Arcis-sur-Aube (March 20), and at Mont-Mirail (April 14), he displayed the same gallantry as in the more renowned but not more glorious fields of Jena, Tudela, and Wagram. It is however stated that Lefebvre greatly influenced the abdication of Napoleon, and at the first restoration of Louis XVIII. he was created Chevalier of St. Louis and peer of France. But on the return of his former chief from Elba, we find him again adhering to his fortunes, and accepting a seat in his Chamber of Peers, where however he held himself aloof from all discussions. ('Journal des Débats' of the 10th of April 1814). At the second restoration of the Bourbons, he was excluded from the Chamber of Peers, to which he was recalled in 1819, having been a few years previously reinstated in his rank of marshal. He died at Paris on the 14th of September 1820.

There was another well-known general of Napoleon, the COUNT CHARLES LEFEBVRE DESNOUETTES, whose name has sometimes been confounded with that of Marshal Lefebvre. He was condemned to death on the second restoration of the Bourbons, but he was enabled to take refuge in the United States. He perished in a shipwreck on the coast of Ireland, as he was returning to Europe, on the 22nd of April 1822.

LEFORT, FRANÇOIS, was the son of Jacques Lefort, member of the Grand Council of Geneva, in which city he was born in 1656. After having served as a cadet in the Swiss Guards in the service of France, and subsequently in a regiment belonging to the Duke of Courland, in the pay of the Dutch, he was induced to try his fortune as a military man in Russia, and obtained a captain's commission from the czar Feodor or Theodore Alexiwich, and greatly distinguished himself in the wars with the Turks and the Tartars. Having in 1678 married Mademoiselle Soubai, whose father, a native of France, held the rank of lieutenant-colonel in the Russian service, he revisited his native country in 1682, but, staying only for a few weeks, got back to Russia in time to be in readiness for the crisis which occurred on the death of Theodora. His abilities being well-known, he was appointed by the Prince Galitzin, who governed the country under the Princess Sophia, in the name of her two brothers Ivan and Peter, one of the captains of a new body of troops raised to counteract the domination of the Strelitzes, or old national militia. In this capacity he first attracted the attention of the young czar Peter, in the early part of the year 1683; and on the 29th of June in that year he was raised by him to the rank of major. When, in 1689, Peter took refuge in the Troitski convent, Lefort was one of those who joined him there, and on the overthrow of the usurpation of Sophia, which followed, he became the chief minister of the emancipated emperor. Many of Peter's greatest plans are believed to have been suggested by Lefort; all the czar's measures for civilising and elevating his country found in him, at least, the most able and zealous of seconders and promoters. Holding at once the rank of general and of admiral, Lefort was always equally ready for service by land or by sea; and his active and versatile faculties shone as much in civil affairs as in military. At last Peter lost this inestimable servant by his death at Moscow on the 12th of March 1699: his health had been for some time declining, and a fever following upon the breaking out of an old wound carried him off. Peter lamented him as if he had been a brother. Lefort's moral nature appears to have been as admirable as was his capacity; considerations of self-interest were always postponed by him to the public good and the glory of his sovereign, and a noble contempt of everything mean or mercenary marked the whole of his career. He left a son, but he died at an early age.

LEGENDRE, ADRIEN-MARIE, an analyst, whose name must follow those of Lagrange and Laplace in the enumeration of the powerful school which existed in France at the time of the revolution, was born at Paris in 1751, and died there January 10, 1833. Of his personal life we can only now say that it was passed in strenuous and successful exertions for the advancement of mathematical science and of its applications. He never filled any political post, or took any marked part in public matters: he was, we believe, no favourite of any government, and his scientific fame did not procure him more than a very moderate competency. The writings of M. Legendre consist of various papers in the 'Memoirs' of the Academy of Sciences, and several separate writings of which we shall give a slight account.

The first appearance of Legendre as a mathematician was in 1782 as the writer of two papers, one on the motion of resisted projectiles, the other on the attraction of spheroids, which gained prizes from the academies of Berlin and Paris, and a place in the former as the successor of D'Alembert. In a memoir on double integrals, published in the volume for 1788 (though presented at the end of 1799), he digested a method of transforming an integral with two variables to one depending upon other variables, which he applied to the question of the attraction of spheroids. He was the first who extended the solution of this question by the aid of modern analysis: it being not a little remarkable, that this problem in the year 1773 required the power of Legendre to show that even as much could be done with it by the modern analysis as had been effected with the ancient methods by Newton and Maclaurin. Various other memoirs by Legendre refer either to points of the integral calculus, or to his geometrical operations.

BIOG. DIV. VOL. III.

In 1787 he was appointed one of the commissioners for connecting the observatories of Greenwich and Paris by a chain of triangles. Cassini de Thury had memorialised the British government on the expediency of this step: the execution of which was committed to General Roy on the English side, and to Legendre, Cassini, and Méchain on the French. Much of the work was completed in 1787, and a memoir of Legendre, published in the volume for that year, upon some theoretical points, contains one of those simple and beautiful theorems which carry the name of their inventors with them for ever. It is the celebrated proposition relative to the 'spherical excess' of a small spherical triangle. An account of the actual triangles constructed in his survey is contained in the volume for 1788. When the grand French arc of the meridian was completed, Laplace and Legendre were employed to deduce the form of the spheroid which agreed most nearly with all the observations. In the construction of the large trigonometrical tables (which still remain unpublished) he contributed some simplifying theorems. In 1806 he published his 'Nouvelles Méthodes pour la Détermination des Orbites des Comètes,' in which he gives a method the peculiarity of which then was that it allowed of the correction of the original observations at any part of the process. It may be doubtful whether the method itself was an improvement upon those which were then in use; and if it were, it is still superseded by others posterior to it. But this tract is further remarkable by its containing the first proposal to employ the method of least squares. Whether Legendre had seen the hint of Cotes or not, he made a proposal of great ingenuity, and introduced, as a matter of practical convenience, a method which was afterwards shown by Laplace to be entitled to confidence on the strictest grounds of principle.

Legendre applied himself at an early period of his life to the development of those integrals on which the determination of the arcs of an ellipse and hyperbola depend. In the 'Memoirs' of the Academy for 1786 are two papers on the subject written by him. His 'Exercices du Calcul Integral,' published in 1811, contain, among other matters of high curiosity, an extended view of the same subject. He continued to devote himself assiduously to the cultivation of this new branch of science, and in 1825 and 1826 he produced the two volumes of his 'Traité des Fonctions Elliptiques et des Integrales Euleriennes,' containing a digested system, with extensive tables for the computation of the integrals. The work was hardly published when the discoveries of Messrs. Abel and Jacobi appeared. These mathematicians, both then very young, had begun by looking at the subject in another point of view, and had produced results which would have materially simplified a large part of the work of Legendre, if he had had the good fortune to find them. With a spirit which will always be one of the brightest parts of his reputation, Legendre immediately set about to add the new discoveries to his own work; and in 1828 and subsequent years appeared three supplements, in which they are presented in a manner symmetrical with the preceding part of the work, and with the fullest acknowledgment of their value and of the merit of their authors.

To Legendre is also due the collection of the results obtained upon the theory of numbers, a subject to which he made very remarkable additions. The second edition of his 'Théorie des Nombres' was published in 1808, and the third in 1830.

The best known of Legendre's works is, as might be supposed, his 'Elements of Geometry,' of which Sir David Brewster gave an English translation in 1824, from the eleventh edition: Legendre published his twelfth edition in 1823. Of the finished elegance and power of this very remarkable work it is not easy to speak in adequate terms: and next to the Elements of Euclid, it ought to hold the highest place among writings of the kind. But it would not be difficult to show that much of the rigour of Euclid has been sacrificed, and though those who determine to abandon the latter cannot do better than substitute Legendre's work, we hope that in this country the old Greek will maintain his ground at least until a substitute can be found who shall give equal rigour of demonstration, as well as greater elegance of form.

LEGRAND, JACQUES-GUILLAUME, a French architect and a writer on subjects of architecture, was born at Paris May 9th, 1753. When studying in the École des Ponts et Chaussées he attracted the notice of Perronet, and was, while yet very young, entrusted with the execution of the bridge at Tours. His taste however disposed him far more to architecture than to engineering, and he accordingly placed himself under Blondel, and after his death pursued his studies under Clerisseau, who, esteeming his character no less than his talents, bestowed his daughter upon him in marriage. With Molinos, his friend and his professional associate in most of his works, he made a tour through Italy, and was preparing to investigate the remains of art in Magna Græcia, when he was recalled home by the government. From that period he was employed during nearly twenty years in restoring several public edifices and erecting others. One of his most noted works, which he executed in conjunction with Molinos, was the timber cupola of the Halle aux Bleds. The Théâtre Feydeau, the restoration of the Fontaine des Innocens, of the Halle aux Draps, and of the interior of the Hôtel Marboeuf, besides a number of designs for private individuals, were executed by him. He had been appointed to conduct the repairs of the abbey of St. Denis, and had removed to that place for the purpose of giving his undivided attention to the

works, just before his death, which happened November 10th, 1806. Among his writings are the text to the 'Edifices de Paris,' and the 'Galerie Antique,' and to many of the architectural subjects in the 'Annales du Musée;' also the architectural portion of Cassas's 'Voyage Pittoresque d'Istrie,' and that of 'Phenicie;' and an octavo volume to accompany Durand's 'Parallèle d'Edifices.' This last was merely the sketch of a more complete and detailed history of architecture, which, had he lived to execute it as he had proposed, would have extended to thirty volumes.

LEIBNITZ, GOTTFRIED WILHELM, was born on the 3rd of July 1646, at Leipzig, where his father (Friedrich) was professor of jurisprudence. Having lost his father at the age of six years, he was placed at the school of St. Nicholas, in his native city, from which he was removed in his fifteenth year to the university of the same place. Although law was his principal study, he combined the legal lessons of the elder Thomasius with those of Kuhn in mathematics, and applied at the same time with great diligence to philology, history, and, in short, to every branch of knowledge. Of ancient writers, Plato, Aristotle, and the Pythagoreans seem to have exercised the greatest influence on his mental character, and his profound knowledge of their writings has furnished many an element in his own philosophy, while it suggested a wish, as bold as it was impracticable, of reconciling their several systems and combining them into one consistent whole. After further prosecuting his mathematical studies at Jena under Erhard Weigel, Leibnitz returned to Leipzig, where he passed successively to the degrees of Bachelor and Master in Philosophy. On the latter occasion (1664) he read his treatise 'De Principio Individuationis,' in which he took the side of the nominalists against the realists. His pursuits at this time were chiefly of a mathematical and juridical character. In 1664 appeared the treatise 'Questiones Philosophicæ ex Jure collectæ,' which was followed in the next year by the 'Doctrina Conditionum.'

The treatise 'De Arte Combinatoria' was published in 1666. This important and remarkable work contained a new method of combining numbers and ideas, and was intended to exhibit the scientific advantages of a more extensive design, of which it was only a particular application. This general design, which is sketched in the 'Historia et Commendatio Linguae Characteristica Universalis' ('Posthumous Works,' by Raspe, p. 535), was the invention of an alphabet of ideas, to consist of the most simple elements or characters of thought, by which every possible combination of ideas might be expressed; so that by analysis or synthesis the proof or discovery of all truth might be possible. Notwithstanding such early proofs of his genius and talents, Leibnitz was refused a dispensation of age which he had asked for at Leipzig in order to take the degree of Doctor of Laws, which however he obtained at Altorf. His exercise on this occasion was published under the title 'De Casibus in Jure Perplexis,' which was everywhere received with approbation. Declining a professorship here offered to him, in all probability from a distaste for a scholastic life, he proceeded to Nürnberg, where he joined a society of adepts in the pursuit of the philosopher's stone, and, being appointed secretary, was selected to compile their most famous works on Alchemy. For such an occupation he is said to have proved his fitness by composing a letter, requesting the honour of admission, so completely after the style of the alchemists, that it was unintelligible even to himself. From these pursuits he was removed by the Baron von Boineburg, chancellor to the Elector of Mainz, who invited him to proceed to Frankfurt in the capacity of councillor of state and assessor of the chamber of justice. He here composed the valuable and important essay 'Nova Methodus docendi discendique Juris, cum subjecto catalogo desideratorum.' At this time Leibnitz began to prosecute the study of philosophy with greater energy, and to extend his fame to foreign countries by the republication of the work of Nizolius, 'De vera Principiis et vera Ratione Philosophandi,' to which he contributed many philosophical notes and treatises. To this date belong two original compositions which are remarkable for their boldness of views, and as containing the germ of his later philosophical system. Of these two works, the 'Theoria Motus Concreti' was communicated to the Royal Society of London, and the 'Theoria Motus Abstracti' to the Academy of Sciences of Paris. The latter city he first visited in 1672, in company with the son of his patron, and there formed the acquaintance of the most learned and distinguished men of the age—among others, of Malebranche, Casini, and Huyghens, whose work on the oscillation of the pendulum attracted Leibnitz to the pursuit of the higher mathematics. Leibnitz next proceeded to London, where he became personally acquainted with Newton, Oldenburg, Wallis, Boyle, and others, with many of whom he had previously maintained an active correspondence. Upon the death of the Elector of Mainz, he received from the Duke of Brunswick Lüneburg the appointment of Hofrath and Royal Librarian, with permission however to travel at pleasure. He accordingly visited London a second time, in order to make known his mathematical studies and to exhibit his arithmetical machine. This machine, either an improvement on that of Pascal or an original invention, is described in the first volume of the 'Miscellanea Berolinensia,' and is still preserved in the museum at Göttingen. From London Leibnitz returned to Hanover, where he was engaged in arranging the library and in the discovery and development of the method of infinitesimals, which was so similar to the method of

fluxions of Newton as to lead to a bitter dispute between the admirers of these great men, and ultimately between themselves, as to the priority of discovery. To decide this dispute the Royal Society of London, at the request of Leibnitz, nominated a commission, which decided in favour of Newton. There is little doubt however that the two methods were equally independent and original; but the priority of publication is in favour of Leibnitz. To this period belong also the important works of a mixed historical and political nature, 'Scriptores Rerum Brunsvicensium,' and the 'Codex Juris Gentium Diplomaticus,' the materials of which he had collected during his travels through France, Suabia, Bavaria, and Austria, which he undertook at the instance of Duke Ernest Augustus of Brunswick. In 1683 he joined Otto Mencke in publishing the 'Acta Eruditorum' of Leipzig, and from 1691 he was also a constant contributor to the 'Journal des Savans,' in which many of his most important essays on philosophy first appeared. To this period belong also the composition of the 'Monadologie' and the 'Harmonie Préétablie.' In 1702 Leibnitz was appointed President of the Academy of Sciences at Berlin, which the Elector of Brandenburg, afterwards Frederick I. of Prussia, had established at the instance of his queen, a princess of the house of Brunswick, and by the advice of Leibnitz himself. In 1710 the 'Theodicee' was published, with a view to oppose the tendency of the writings of Bayle; and two years afterwards the 'Nouveaux Essais sur l'Entendement Humain,' in answer to the essay of Locke. In the previous year Leibnitz formed the personal acquaintance of Peter the Great, who, at Torgau, consulted him on the best means to be adopted for the civilization of Russia, and rewarded his valuable suggestions by the title and dignity of councillor of state and a pension of 1000 rubles. Shortly afterwards, at the instance of Prince Ulrich of Brunswick, the emperor, Charles VI., elected him aulic councillor and baron of the empire; and, in consequence, he visited Vienna, where he became acquainted with the Prince Eugene of Savoy and the chancellor Count Sinzendorf. Upon the elevation of the Elector of Hanover to the throne of England, Leibnitz returned to Hanover, where, after the publication of a few political and philosophical works, he expired on the 14th of November 1714. He was buried on the esplanade at Leipzig, where a monument in the form of a temple indicates, by the simple inscription, "Ossa Leibnitii," the place of his burial.

The first object of the philosophical labours of Leibnitz was to give to philosophy the rigour and stability of mathematical science. The latter derives this character both from its formal portion, or demonstration, and also from the nature of its object-matter. With a view to the former, Leibnitz assumed the existence of certain universal and necessary truths which are not derived from science, but grounded in the very nature of the thinking soul. ('Principia Philosophiæ,' s. 30-7.) As the object-matter of mathematics may be supposed to be constructed of points or units, Leibnitz was led to the assumption of certain primary constituents of all matter. These are his famous monads, which form the basis of his system. These monads are simple substances without parts, out of which all bodies are compounded by aggregation. They are real, because without real simple principles the composite would not possess reality; and consequently, if there were no monads, nothing of any kind could exist really. These monads must not be confounded with the atoms of Democritus or Epicurus. They are real units, the grounds of all activity, or force, and the prime absolute principles of all composite things, which may ultimately be resolved into them. Leibnitz called them metaphysical points and substantial forms. Being without parts, they are necessarily unextended, indivisible, and without figure. As such they are incapable of dissolution, and without natural decay or production, which is only possible in composite bodies. The monads therefore were created at once and momentarily, and in the same manner they must be destroyed or last for ever. Internally they admit not of change, since neither substance nor accident can penetrate what is wholly without parts. Nevertheless they must possess certain determinations or qualities, since otherwise they could not be things. Further, every monad is distinct from all others; for there cannot be two things absolutely identical and without internal difference. This proposition forms one of Leibnitz's necessary and fundamental principles, which he called the 'principle of identity of indiscernibles' (principium identitatis indiscernibitium). According to this principle all things must differ more or less, since otherwise they would be indistinguishable, for identical things are indiscernible. All created things are subject to change; consequently the monads also are constantly changing. This change however is only external, and does not operate internally; on the contrary, the outward change results from an internal principle; and this internal principle of change constitutes the essence of all force: the monads consequently are forces. Besides this principle of change, every monad possesses also a certain schema of that which is changed, which, so to say, while it expresses the differences and multiplicity of the monad, yet comprises the multiplicity in unity. All natural changes proceed in gradation; consequently, while one part is changing, another remains unchanged, and the monads consequently possess a plurality of affections and relations. This transitory state, which experiences and exhibits the multiplicity of changes in the unity of the monad, is perception, which however is unconscious (sine conscientia). The active force, by

which the change or passage from perception to perception is accomplished, is an appetite (*appetitus*). By its action the monads are ever attaining to new perceptions, in which their whole activity consists, and besides which nought else is in them; consequently they may be termed *entelechies*, as possessing a certain perfection and a certain self-sufficiency by which they are the sources of their own activity. In lifeless things perception is uncombined with consciousness; in animated, it is combined with it and becomes *apperception*. The monads endued with *apperception* may be called souls, and, in combination with the unconscious monads, constitute all animals; the only difference between man and the rest of animals, as between God and man, consisting in a higher degree of perfection. The unconscious perception is also found in the monads endued with *apperception*, when they are in a state of sleep or are stunned, for in sleep the soul is without *apperception*, and like the other monads. All perceptions however are closely dependent on each other; and when consequently the soul passes from sleep, the unconscious perceptions which it had during that state form the link which connects its present thoughts with the past. This fact affords an explanation of memory, and that anticipation of like results from like causes which guides the conduct of all animals. Man however is distinguished from the rest by his cognition of eternal and necessary truths; by these he rises to a knowledge both of his own and the Divine nature; and these constitute what is called reason or mind. By these necessary truths man becomes capable of the reflex art of distinguishing the subject (*ego*) and the object (*res*), and furnishes him with the fundamental principles of all reasoning, namely, the principle of contradiction and the law of sufficient reason. According to the former, whatever involves a contradiction is false, and its opposite true; the latter teaches that nothing can be true or exist unless some reason exist why it should be as it is, and not otherwise. This sufficient reason of all necessary truths may be discovered by analysis, which arrives ultimately at the primary notions which assume the form of identical propositions, and are incapable of proof, but legitimate themselves. In the same manner all contingent truths must have an ultimate cause, since otherwise an infinite series of contingencies must be assumed in which reason would be lost. This last cause of all things and of their mutual dependence in the universe is God, who is absolute infinite perfection, from whom all things derive their perfection, while they owe their imperfection to their own nature, which, as finite, is incapable of receiving into itself infinite perfection. The Divine intellect is also the source of all eternal truths and ideas, and without God nothing could possibly be actual, and nothing could exist necessarily. God alone, as possessing infinite perfection, exists of necessity; for as nothing obstructs his potentiality, he is without negation or contradiction, and is unlimited. But although the eternal truths have their reason in the nature of God, they are not therefore arbitrary or determined by the will of God. This is the case only with contingent truths. God, as the prime monad by whom all created monads were produced, is omnipotent; as the source of the ideas after which all things were created and from which they receive their nature, he is intelligent, and he also possesses a will which creates those finite things which his intelligence recognises as the best possible. These same properties of intelligence and will constitute the subject, or *ego*, in man, by which he is capable of perceiving or desiring. While however these attributes are in the highest degree of perfection in the Deity, in finite things they are variously limited, according to the respective degrees of perfection.

As imperfect, the activity of the created monads tends without themselves; consequently they possess activity so far as they possess clear perceptions (*apperception*), and are passive so far as they perceive obscurely. Of two composite substances, that is the more perfect which possesses the ground of the contingent changes of the latter: but simple substances cannot exert any influence on each other, unless by the intervention of the Deity, who at the creation arranged them in due co-ordination with each other. This adjustment of the monads was in accordance with certain sufficient reasons in each monad, by which the Divine will was moved to place the passivity of one and the activity of one in an harmonial relation; this sufficient reason was their comparative perfection: hence the famous principle of Leibnitz, which has been designated by the term *Optimism*—that of all possible worlds, God has chosen and produced the best.

As every monad stands in harmonious relation to all others, it expresses the relations of all, and is, as it were, a mirror of the universe which is represented in a peculiar manner by each. Hence the greatest possible variety is combined with the greatest possible harmony. God alone can embrace all these relations, while finite minds have only a very obscure perception of them. All in the world is full, and bound together into one continuous and coherent whole. The motion of each single monad, whether simple or in aggregation, affects all according to distance; and God therefore sees all future things, as well as present and past. But the soul is only cognisant of what is present to it; and although indeed it represents the whole universe, yet the infinity of objects surpasses its capacity, and its clearest representations are of those which immediately affect the body with which it is united. The soul pursues its own laws, and the body likewise its own; both however, by reason of the harmony established at the creation among all monads, as representatives of the universe,

act in unison. The soul strives after means and ends, and works by the laws of final causes; the body, by those of efficient causes. Both species of causes are in harmony with each other. Such is the system of pre-established harmony, according to which the body and soul act independently of each other, and each as if the other did not exist, and yet nevertheless both as if they had an influence on each other. This harmonious relation of the body and soul Leibnitz illustrates by the supposition of two clocks, one of which points, while the other strikes the hour: both harmonise in their movements, but nevertheless are independent of each other.

The power and goodness of God are displayed in the whole universe, but it is in the moral world that they are chiefly visible. Between the natural and the moral worlds, or between God as creator of the mundane machine and as ruler of spirits, the strictest harmony subsists. God as architect of the world is consistent with himself as lawgiver; and agreeably to the mechanical regulation of the course of nature, every transgression is followed by punishment, as every good act is by rewards, since all is so disposed as to contribute to the good and happiness of the whole. This is the grand principle of the 'Theodicée.' In this work Leibnitz shows that God, as all-powerful, all-wise, and all-good, has chosen and created the best of all possible worlds, notwithstanding the seeming objections which may be drawn from the existence of evil. If a better constitution of things had been possible, God would have chosen it in preference; and even if another equally good had been possible, there would not have been any sufficient reason for the existence of the present world. The existence of evil is both metaphysical and physical. As to the former, the antecedent will of God designed infinite good; but this was not possible, since the multiplicity of things necessarily limit each other, and this limitation is evil. But evil may also be considered as physical and moral. Physical evil is a necessary consequence of the limitation of finite things. Moral evil however was not necessary, but became a consequence of metaphysical and physical. But the less evil must be admitted for the sake of greater good; and evil is inseparable from the best world, as the sum of finite beings to whom defect and imperfection necessarily cling by nature. God therefore permitted its existence: for as the world contains a good incomparably greater than its attendant evil, it would have been inconsistent with the Divine goodness and wisdom not to have realised the best possible world, in consequence of the comparatively little evil which would come into existence with it.

A more immediate source of evil is the freedom of the human will, which however exists for the sake of a greater good, namely, the possible meritoriousness of man and his consequent adaptation to a state of felicity to be attained by his spontaneous acts. This freedom of man is intermediate between a stringent necessity and a lawless caprice. That man is free who, of several courses which in certain circumstances are physically possible, chooses that which appears the most desirable. This choice however cannot be without a motive or sufficient reason, which however is of such a nature as to incline only, and not to compel. Every event in the universe takes place according to necessity; but the necessity of human actions is of a peculiar kind; it is simply moral, and is not destructive of its contrary, and consists merely in the choice of the best. Even the Divine omniscience is not destructive of human liberty. God unquestionably knows all future events, and among these consequently the acts of all individuals in all time who act and sin freely. This prescience however does not make the contingency of human actions a necessity.

Such was the philosophical system by which Leibnitz sought to correct the erroneous opinions of his age, which had been drawn from the theory and established on the authority of Descartes. The broad and marked distinction which the latter had drawn between matter and mind had led to an inexplicable difficulty as to the reciprocal action of the body and soul, to get rid of which Spinoza had advanced his theory of substance, and denied or got rid of the difference. Leibnitz attempted to solve this difficulty by resolving all things into spirit, and assuming nothing but mental powers or forces. Nevertheless he has only presented the dualism of the Cartesian theory under another form; and the equal difficulty of explaining the community of action between the conscious and unconscious forces, so as to account for the reciprocal influence of body and mind, forced him to have recourse to the gratuitous assumption of the pre-established harmony. As to the charge of fatalism, which Dugald Stewart has objected to, his objection seems to have arisen from that antagonism of error which takes refuge from a blind necessity in irrational chance. The theory of optimism has been the subject of the satire of Voltaire, but it is not more misrepresented in 'Candide' than in the 'Essay on Man.' Pope and Leibnitz agree in the position that of all possible systems infinite wisdom must form the best; but by the coherency of all, the former understood the co-existence of all grades of perfection, from nothing up to Deity; the latter, that mutual dependence of all in the world by which each single entity is a reason of all others. By the fullness of creation Leibnitz denied the existence of any gap in the causal order of co-existent things; Pope asserted by it the unbroken series of all degrees of perfection. The Divine permission of evil, Pope referred to the indisposition of the Deity to disturb general by occasional laws. There is consequently evil in the world which the Deity might have got rid of, if he were willing in certain cases to

interrupt his general providence. Consequently he admits evil in the world which does not contribute to the perfection of the whole. Leibnitz however denies that God could remove the existing evil from the world without prejudice to its goodness. He moreover does not admit of the opposition of general and particular providence, but makes the general law of the universe to be nothing else than the totality of all special laws. (On this subject consult Mendelsohn, 'Kl. ph. Schriften,' p. 538.)

Leibnitz has been spoken of principally as a metaphysician, but it should be remembered that his mathematical fame is as high among mathematicians as his metaphysical reputation is among metaphysicians, and perhaps higher.

Of the works of Leibnitz several editions and collections have appeared. The two principal are the following:—'G. W. Leibnitii, Opp. omnia nunc primum coll. stud.,' Dutens, Geneva, 6 vols.; and 'Œuvres Phil., Lat. et Franco, de feu M. Leibnitz, pub. par M. Raspé,' Amsteld., 4to, 1765. The 'Commercium Philosophicum et Mathematicum,' 2 vols. 4to, containing the correspondence of Leibnitz with John Bernoulli, was published at Lausanne and Geneva in 1745.

LEICESTER, ROBERT DUDLEY, EARL OF, one of Queen Elizabeth's principal favourites, was born about the year 1531, of an ancient and noble family. Edmund Dudley, the rapacious minister of Henry VII., was his grandfather. His father was John Dudley, duke of Northumberland, who, after attaining considerable celebrity during the reigns of Henry VIII. and Edward VI., was executed in August 1553, for his adherence to the claims of Lady Jane Grey, who was his daughter-in-law. Robert Dudley was knighted by Edward VI.; was imprisoned at the same time and for the same offence as his father; was liberated in 1554; and was afterwards appointed master of the ordnance to Queen Mary. He had all those exterior qualities which were likely to ingratiate him with a queen: a youthful and handsome person, a polite address, and a court-ous insinuating behaviour; and Elizabeth was no sooner on the throne than she bestowed upon him a profusion of grants and titles. He received from her lordships, manors, and castles: he was made master of the horse, a privy-councillor, a knight of the garter, high-steward of the University of Cambridge, baron of Denbigh, and earl of Leicester; to which other dignities were subsequently added. Leicester was continually in attendance at court, and the queen delighted in his society. At an early age he had married Amy, the daughter of Sir John Robsart. In 1560 this lady died suddenly at Cumnor under suspicious circumstances, murdered, as many supposed, at the instigation of her husband, who, seeing no bounds to the queen's friendship for him, found his wife an obstacle to his ambition: but there really appears no sufficient ground for the suspicion, which however Sir Walter Scott, who in his 'Kenilworth' has in the most extraordinary manner distorted the historical circumstances, has rendered the common opinion. The queen admired Leicester, trusted him, and allowed him great influence; she also projected a marriage for him with Mary, Queen of Scots. It is scarcely necessary to say that the union did not take place; and that Leicester, continuing to reside at court, played his part with the queen with consummate dexterity. During this residence he engaged in an intrigue, or, as the lady asserted, a marriage with the widow of Lord Sheffield, who bore him a son, to whom he bequeathed much of his property, and the reversion of some of his estates on the death of his brother, in a will which designated him his 'base' son. Lady Sheffield, in a long and elaborate statement which she drew up when her son Sir Robert Dudley sought in the reign of James II. to establish his legitimacy, declares that she afterwards narrowly escaped death from some poison that was administered to her, and being menaced by the Earl of Leicester, consented to marry Sir Edward Stafford, "a person of great honour and parts, and sometime ambassador to France," as the only way to protect herself from the vengeance of the earl: and she declares that "she deeply repented afterwards of this marriage, as having thereby done the greatest wrong that could be to herself and her son." The proceedings, we may add here, were suddenly brought to a stop at the suit of Leicester's widow, the Lady Lettice, the Star Chamber ordering the papers to be sealed up, and the principal witnesses "to be held suspect." Sir Robert Dudley immediately left the country, and never returned to it. But in the reign of Charles I., the king, who succeeded to Kenilworth as heir to his brother Prince Henry, who had purchased Sir Robert Dudley's title to that estate, bargained with the wife of Sir Robert Dudley (she having separated from her husband who was living at Florence) for the purchase of her jointure on the Kenilworth property, and (as a part apparently of the purchase money) created her Duchess of Dudley, the patent setting forth that the legitimacy of Sir Robert Dudley had been fully established. Sir Walter Scott it may be noticed has borrowed much of the testimony of the widow of Lord Sheffield—who claimed to be Leicester's wife—and transferred it to Amy Robsart, whom he never denied, except in the pages of the novel, to be his wife.

Returning to the proper course of Leicester's career, we may observe that Leicester's favour continued, and the queen was prevailed upon to visit his castle at Kenilworth, in Warwickshire, where he entertained her for many days with pageants and feasting, prepared in a style of magnificence unequalled even in those days. It is not surprising that Leicester, on account of the undue eminence to which he had risen,

should have been odious to Cecil, Essex, and many of the principal English nobility; neither can it be wondered at that the foreign ambassadors who came to treat for the hand of the queen should have felt hostility towards a courtier who, aspiring to be her suitor himself, was known to be adverse to her making a foreign alliance. To undermine his power was the interest of many persons; and it was with this view that Simier, the ambassador of the Duke of Anjou, acquainted Elizabeth with a fact which had been hitherto concealed from her, namely, Leicester's marriage with Lady Essex. The queen was violently angry when first the disclosure was made, and threatened to commit him to the Tower; she relented however, and again received him at court with undiminished esteem. There were other persons to whom, for other reasons, Leicester's marriage was likewise a source of anger. There were suspicions that foul means had been resorted to for its accomplishment. These suspicions, as in the previous cases, could not be proved; for such inquiries as were not suppressed through fear were foiled by artifice; but considering Leicester's character, they were not unwarranted by the facts. He had become enamoured of Lady Essex during her husband's lifetime. Lord Essex died suddenly of a peculiar sickness which could not be accounted for, and two days after his death Leicester was married to his widow. Accusations for this and other offences were not only made in private, but attacks against him were published in a book entitled 'Leicester's Commonwealth,' which the queen caused her council to contradict upon her own personal knowledge and authority.

In 1585 Leicester took charge of some forces sent to the Low Countries, and was invested with great powers for the settlement of some differences that had arisen there: he sailed in December, and was received at Flushing with great pomp. He was unfit however for a military commander, and so fully manifested his incapacity while opposing the troops of his experienced adversary the Prince of Parma, that on his return to the Hague the States expressed their dissatisfaction at his tactics, and suspicions of his fidelity. He returned to England in November 1586. [BARNEVELDT.] It was at the time of his arrival that Elizabeth was anxious to determine what course to pursue with her prisoner Mary, Queen of Scots. When Leicester was consulted, his advice appears to have been that she should be privately put to death. In 1587 he returned to the Low Countries with a considerable force, both horse and foot, and was received with honours; but before long fresh quarrels arose between him and the States; he was again accused of mismanagement, and the queen recalled him after an absence of five months.

In 1588 he was appointed lieutenant-general of the infantry mustered at Tilbury Fort for defence against the Spaniards. This was the last trust conferred upon him. He was seized with illness at his house at Cornbury, in Oxfordshire, which he had visited on his road to Kenilworth, and died on the 4th of September 1588; and as he had before been suspected of poisoning, so now, perhaps from the suddenness of his death, he was suspected to have been poisoned, and the vulgar suspicion pointed at his wife, though the Privy Council appears to have thought it necessary to prosecute an inquiry into a report of his having been poisoned by a son of Sir James Crofts, in revenge for the imprisonment of his father. Leicester's body was removed to Warwick for interment. After the fashion of the age, he gave lands for charitable endowments, and the hospital of Robert, earl of Leicester, at Warwick, still remains as a monument of his liberality, or of his conformity to the practice of his times.

LEICESTER, OF HOLKHAM, THOMAS WILLIAM COKE, EARL OF, Thomas Coke, Esq., of Holkham, in Norfolk, great-grandson of Sir Edward Coke, the chief-justice, was in 1728 created Baron Lovel, of Minster Lovel, in Oxfordshire; and in 1744 Viscount Coke of Holkham, and Earl of Leicester. On his death without heirs male, in 1759, the titles became extinct, and the estates went to his nephew, Wenman Roberts, Esq. (the son of his sister Anne and her husband, Colonel Philip Roberts), who thereupon assumed the surname and arms of Coke. The subject of the present notice was his son, who was born on the 4th of May 1752. On the death of his father in 1776, Mr. Coke succeeded him in the representation of the county of Norfolk—his only inducement as he asserted in a speech which he made at a dinner given to him in 1833, being that he was told if he would not stand, a Tory would be sure to come in. This horror of Toryism, or of what he imagined that term to mean, constituted nearly the whole of Mr. Coke's political system to the end of his life. With a brief interval Mr. Coke continued to represent the county of Norfolk down to his retirement from the House of Commons in 1832.

Mr. Coke, though a keen and steady partisan, was not a frequent speaker in parliament. The two occasions on which he appeared most conspicuously were, on the 21th of March 1783, when in a short speech he moved an address requesting that his majesty would be pleased to form an administration entitled to the confidence of the people, which, being assented to, was followed by the resignation of Lord Shelburne and the formation of the Coalition Ministry of Mr. Fox and Lord North; and on the 2nd and 3rd of February 1784, when he carried two motions against the existing ministry of Mr. Pitt, which however had no effect. He also on subsequent years came forward on some occasions when measures affecting agriculture occupied the attention of the House. In all matters of general policy

he voted with Mr. Fox, and after his death with Lord Grey and what was commonly called the Whig party.

His influence in the country arose from his large estates and the lead he took in agricultural improvement, together with his popular qualities as a landlord and a country gentleman. He is said to have raised the rental of his estate of Holkham, in the period of between sixty and seventy years during which it was in his possession, from little more than 2000*l.* to above 20,000*l.* From the death of Francis, duke of Bedford, in 1802, he was regarded as the chief of English agriculturists. His plantations were so extensive that the average value of the annual fall of timber on his property is stated to have amounted at his death to 2700*l.*, or considerably more than the entire rental of the land when it came into his hands. The annual sheep-shearing at Holkham, at which some hundreds of guests were entertained for several days, was probably the greatest agricultural festival in the world.

According to Mr. Coke's own account in the after-dinner speech of 1833 already quoted, he was twice offered a peerage in the first session that he sat in parliament. More than sixty years after, namely, on the 21st of July 1837, he was at last raised to the Upper House as Earl of Leicester, of Holkham. It is understood that the difficulty which had prevented his being sooner made a peer was that he would accept of nothing except this earldom of Leicester, which had been held by his maternal great-uncle, whose estates he inherited, but which had in the meantime been bestowed, in 1784, upon Lord Ferrers, afterwards Marquis Townshend, to whose heirs it of course descends. It was thought a very strong measure, when, to gratify the old man, the same title, with the slight and not very intelligible variation, 'Leicester of Holkham,' was bestowed upon a second person. It made of course no difference that the other Earl of Leicester had subsequently acquired a higher title; he was still notwithstanding as much Earl of Leicester as Marquis Townshend. The proceeding was precisely of the same nature as if Mr. Coke had been made Duke of Wellington, of Holkham.

The Earl of Leicester died at Longford Hall, Derbyshire, on the 30th of June 1842, at the venerable age of ninety. He was twice married: first, in 1775, to Jane, daughter of James Lennox Dutton, Esq., who died in 1800, and by whom he had three daughters; secondly, on the 26th of February 1822, to the Lady Anne Amelia Keppel, third daughter of the Earl of Albemarle, who brought him five sons and a daughter. The eldest son, born on Christmas-day, 1822, succeeded him as Earl of Leicester of Holkham.

LEIGHTON, ROBERT, D.D., Archbishop of Glasgow, born in 1613; a divine whose sermons and other tracts are held by many persons in great esteem, but who has secured for himself a reputation by having acted in a manner the most opposite to that by which reputation is most commonly secured. In times of excitement he was the steady advocate of peace and forbearance. One story of him so completely illustrates his character, that, though it has been often told, we must repeat it. A question not unfrequently put to the Scottish clergy at their assemblies was, "Whether they preached to the times?" When Leighton's turn came, his reply was, "When all my brethren preach to the times, suffer me to preach about eternity." The times spoken of are those of the Commonwealth, or a little before, when he had a church near Edinburgh; but he found that moderation would not be tolerated in a minister, so that he retired into privacy, from whence however he was called to preside over the University of Edinburgh. When Charles II. resolved to make the attempt at introducing Episcopacy into Scotland, Dr. Leighton was nominated to the bishopric of Dumblane. His conduct was the reverse of that of Dr. Sharpe, who was ostentatious in the display of an ecclesiastical rank which was displeasing to a large portion of the Scotch nation. Leighton on the contrary conducted himself with that moderation which he had before manifested, so that he won the affections of even the most rigid Presbyterians. The bishops generally took a different course, and this induced Leighton to offer to resign his bishopric: but the views of the Court changing in respect of the attempt to bring the Scotch nation to accept an Episcopalian church, and it being intended to proceed more in the way of persuasiveness and gentleness, he was induced to accept the archbishopric of Glasgow. Still he found it an affair of contention little suited to his habits or turn of mind, and accordingly he resigned his archbishopric, and retired in 1674 to the house of his only sister, Mrs. Lightmaker, at Horsted Keynes, Sussex. He died, whilst on a journey, at the Bell Inn, Holborn, London, in February 1684; but was buried in a small chapel (now destroyed) adjoining the chancel of the church of Horsted Keynes. The best edition of Archbishop Leighton's works, with an account of his life, was published in 1808, 6 vols. 8vo.

LE KEUX, JOHN, architectural engraver, was born in 1784, in Sun-street, Bishopsgate, London, where his father was a manufacturer of pewter; and to him the youth was in the first instance apprenticed, but disliking the business, he was at the age of seventeen transferred as a pupil to Mr. James Basire, an eminent architectural engraver, and remained with him four years. Le Keux formed for himself however a true and bolder style than that of his master, and eventually in the engraving of gothic architecture attained an excellence equalled by few in the profession. Indeed it would not be too much to say that

gothic architecture was for the first time thoroughly well engraved in this country by him; and that his engravings did much to render the study of gothic architecture popular. He possessed a very considerable acquaintance with both the general principles and the details of gothic architecture, and consequently his engravings displayed, not only minute correctness, but that 'feeling,' as artists term it, which is always an evidence that the work is executed as a matter of enjoyment, and not merely as a task. Le Keux was in fact an artist and not a mechanic, and even the admirable architectural drawings of Mackenzie lost nothing in fidelity, and sometimes perhaps gained a little in spirit, under the rendering of Le Keux's burin. The first important work we believe on which Le Keux was engaged was 'Britton's Architectural Antiquities of England,' and he also engraved much of 'Britton's Cathedral Antiquities,' and other of Mr. Britton's works; the elder Pugin's 'Architectural Antiquities of Normandy,' 'Gothic Examples,' and 'Gothic Specimens'; Neale's 'Westminster Abbey,' and 'Churches' (vol. i.); 'The Oxford Almanacs'; and lately the 'Memorials of Oxford,' and 'Memorials of Cambridge,' both of which were projected by himself and executed with much elegance, though of course from their smaller size with somewhat less freedom than his larger works. Mr. Le Keux died April 2, 1846. His eldest son, J. H. Le Keux, has a high reputation as an architectural engraver.

LELAND, or LAYLONDE, JOHN, an eminent English antiquary, was born in London in the beginning of the 16th century, and educated at St. Paul's School under the celebrated William Lily. He first entered at Christ's College, Cambridge, where he is said to have been a Fellow, but afterwards removed to Oxford, and passed several years in All Souls College, where he prosecuted his studies not only in Latin and Greek but in Saxon and Welsh. From thence he went to Paris, and learned French, Italian, and Spanish. On his return home he entered into orders, and being esteemed an accomplished scholar, King Henry VIII. made him one of his chaplains; gave him the rectory of Popeling in the marches of Calais in 1530; appointed him his library-keeper; and by a commission dated in 1533 dignified him with the title of his Antiquary. By this commission he was ordered to make search after England's antiquities, and peruse the libraries of all cathedrals, abbeys, colleges, and other places where "records and the secrets of antiquity were deposited;" a stipend was allotted to him; and he received a dispensation for non-residence upon his living. He spent six or seven years in travelling through England and Wales, collecting materials for the history and antiquities of the nation; and noticed in his journey not only the more important manuscripts which he met with, but all the localities and local antiquities of the country of whatever description—the rivers, forests, chases, woods, cities, castles, manor-houses, monasteries, colleges, and everything that seemed memorable. In 1542 Henry VIII. presented him to the rectory of Hasely in Oxfordshire, and the year following to a canonry of King's College, now Christchurch, Oxford. In 1545, upon the surrender of that college to the king, he lost his canonry, but seems to have been compensated for it in the prebend of East and West Knowle, in the cathedral of Sarum. In that same year, having digested into four books that part of his collections which contains an account of the illustrious writers in the realm, with their lives and monuments of literature, he presented it to his majesty, under the title of 'A Newe Year's Gift,' with a scheme of what he intended to do further for the general history and topography of England and Wales. For the purpose of digesting his collections he retired to a house of his own in the parish of St. Michael-le-Querne in London.

In 1547 Leland's royal patron died, and the attention of the Court, according to Bale, became slackened towards his labours. Whether this was really the cause of the disorder by which he became afflicted is matter of doubt, but within a year or two he became insane: and his distemper being made known to King Edward VI., his majesty by letters patent, dated March 5th, 1550, granted the custody of him, by the name of John Layland the Younger, to John Layland the Elder, "with all his lands, tenements, rents, &c., in as large and ample manner as the said John the Younger, being in his right mind, had the same." In this state he continued, without recovery for two years, when he died, April 18th, 1552. He was interred in the church of St. Michael-le-Querne, which then stood at the west end of Cheapside, between the conduit and Paternoster-row.

Leland's papers, upon his death, were committed by King Edward VI. to the custody of Sir John Cheke; but subsequently became dispersed. Sir John Cheke, being obliged to go abroad, left four volumes of Leland's Collections in the hands of Humphry Purefoy, Esq., from whom they descended to Burton, the historian of Leicestershire, who, having obtained possession of eight other volumes of Leland's manuscripts containing his 'Itinerary,' deposited the whole, in 1632, in the Bodleian Library at Oxford.

Part of a volume of Leland's Collections, in his own handwriting, will be found in the Cottonian Manuscript, Julius C. VI., in the British Museum; and it is probable that other libraries contain fragments of his productions. He and Nicholas Udall, between them, prepared the verses in English and Latin which were spoken in the Pageant as Anne Boleyn went to her coronation.

The publications by which Leland is most known are his 'Commentarii de Scriptoribus Britannicis,' not very faithfully edited by

Anthony Hall, 2 vols. 8vo, Oxon, 1709; his 'Itinerary,' published by Thomas Hearne, 9 vols. 8vo, Oxford, 1710-12; reprinted as the third edition in 1770; and 'De Rebus Britannicis Collectanea,' edit. Thoma. Hearne, 6 tom. 8vo, Oxon, 1715; reprinted at London in 1770.

(*Lives of Leland, Hearne, and Wood*, 2 vols. 8vo, 1772; *Chalmers, Biog. Dict.*, vol. xx.; Bliss, edit. of Wood's *Athenæ Oxonienses*.)

LELAND, JOHN, D.D., born 1691, was of a Presbyterian family in Lancashire, but his father removed when he was very young to Dublin. He was designed for the ministry, and early in life he became pastor of a congregation of Presbyterian Dissenters in Dublin, and in that situation he spent the remainder of his life. He received his degree of Doctor of Divinity from the university of Aberdeen. Dr. Leland's name would not however have found its way into these columns had he pursued the course of a useful and pious minister only. His claim to notice rests on various works of which he was the author, in the great controversy of the age in which he lived, on the truth and divine origin of Christianity. His first work, published in 1733, was an answer to Tindal's 'Christianity as old as the Creation.' In 1737 he encountered Dr. Thomas Morgan's work, entitled 'The Moral Philosopher;' and in 1742 he published an answer to a tract entitled 'Christianity not founded on Argument.' In 1753 he published 'Reflections' on such parts of Lord Bolingbroke's 'Letters on History' as relate to Christianity and the Scriptures. All these works are esteemed valuable defences of Christianity; but his principal work is entitled 'A View of the principal Deistical Writers that have appeared in England in the last and present Century; with Observations upon them.' This work first appeared in its original form in 1754. He died in 1766.

LELAND, THOMAS, a divine, scholar, and historical writer, was a native of Dublin, where he was born in 1722. He was not, we have reason to believe, at all connected with the Presbyterian minister just mentioned. Thomas Leland was educated at Trinity College, Dublin, and became early in life a Fellow of that Society, which placed him in a state of independence, and enabled him to devote himself to the pursuit of knowledge and truth, for which he was remarkable through the whole course of his life. His principal works are, 'A Translation of Demosthenes,' 1756-1770; 'A History of the Life and Reign of Philip of Macedon,' 1758; 'A Dissertation on the Principle of Human Eloquence,' 1764, one of the many works that arose out of the publication, by Bishop Warburton, of his 'Divine Legation of Moses;' 'A History of Ireland,' 1773. Dr. Leland was an admired preacher, and after his death, which occurred in 1785, a collection of his sermons, in three volumes, was published.

LELEWEL, JOACHIM, a Polish historian and political character of the first eminence, is descended from a family connected, according to Straszewicz, with England, France, and Germany, which established itself in Poland towards the end of the 17th century. His father, Karol Lelewel, held various offices under the minister of public instruction in the grand-duchy of Warsaw, and subsequently in the kingdom of Poland, when it was placed under the Emperor Alexander by the Congress of Vienna. Young Lelewel, who was the eldest of five children, was born at Warsaw on the 21st of March 1786, and educated chiefly at the University of Wilna, where he distinguished himself by his talents and acquirements, and became in 1814 a professor-adjunct, and subsequently in 1822, after an absence of some time at the school of Krzemieniec and at Warsaw, professor of history. At that time the University of Wilna, under the fostering care of Prince Czartoryski, then minister of public instruction, was in the full tide of prosperity, and numbered 1200 students. So great was the popularity of Lelewel, that when he went to deliver his first lecture the ordinary hall was found insufficient to contain his audience, and the lecture was obliged to be adjourned to a subsequent day, and transferred to a larger space. The suspicions of the Russian government were ever directed against both lecturer and students, partly it would seem from the daring imprudence of Lelewel. Stanislas Kosmian relates that on one occasion, during a time of excitement, he commenced his lecture with the words, "To arms, brethren, to arms! let us die or conquer our freedom!" The startled students sprang to their feet, when he continued in a calm tone, "Such was the cry that sounded over the mountains of Switzerland when William Tell raised the standard of independence." This state of affairs did not last long. In 1823 the discovery of some secret societies among the students led to a series of measures of great harshness and cruelty on the part of the Russian authorities, which terminated in 1824 in the banishment of many of the students, among others the poet Mickiewicz, and in the removal of Lelewel from his professorship. That the suspicions of the Russians were well-founded is denied or thrown in doubt by many of the Polish writers on the subject, and among others by Lelewel himself, who has written a special history of this transaction; but it must be observed that Zan, the head of the secret societies, who was sent by the Russians to Orenburg, was supposed to be alive and in their hands at the time that these writings appeared, and that too free disclosures might have cost him his life, while the subsequent career of almost every one of the students then implicated has shown that they were in reality determined enemies to Russian sway. Lelewel was elected a deputy to the Polish diet, and continued actively engaged both in political proceedings and in literary researches till the outbreak of the insurrection against the rule of the Grand-duke Constantine

[CONSTANTINE, PAVLOVICH], on the 29th of November, 1830. On that very night, and at the very hour that the palace of the Belvedere was assailed, Lelewel's aged father died, and the son, who had engaged in the conspiracy, was necessarily absent at the side of the death-bed. His name and that of Chlopicki were the two mentioned as candidates for the dictatorship, but the reputation of the soldier prevailed. Lelewel was however elected a member of all the higher bodies of the revolutionary government, both during Chlopicki's dictatorship and after his resignation; became minister of public instruction, and was at the same time chief of a revolutionary club. The most opposite statements and opinions were current as to the nature and tendency of his measures. While by some he was regarded as a revolutionist of the most desperate character, engaged in secret machinations to push on his colleagues in the government to measures of reckless violence; by others he was looked upon as a mere man of books and speeches, totally lost when the requisite was action. The Emperor Nicholas evidently adopted the former opinion, since in a proclamation, in which he ranted the Polish insurgents according to twelve different degrees of guilt, Lelewel's name stood in a class by itself as the most obnoxious of all. Time appears to have established the truth of the opposite view, or, at all events, to have shown that, whatever Lelewel's theories might be, as a man of action he was out of his place. On the suppression of the Polish insurrection he made his way in disguise to Germany, and subsequently to Paris, where he arrived towards the end of 1831. Though he was then of the age of forty-five, it was the first occasion on which he had ever been out of Poland, and he has never since had the opportunity of returning. He was elected in Paris chief of the emigration, and in that capacity affixed his name to some proclamations which gave offence to the French government, who at first admonished him, and afterwards finding fresh reason to be dissatisfied with his conduct, finally in January 1833 sent a body of soldiers to remove him from General Lafayette's seat at Lagrange, where he was on a visit, and directed him to leave the country. For the three-and-twenty years since his removal from France he has resided at Brussels, where he has quietly devoted himself to literary and antiquarian labours.

It is remarked by Stanislas Kozmian that in the west of Europe the name of Lelewel is known only to a select few, while in the east, of course more especially in Poland, it is popular among whole nations. Even his successor in the chair of history at Wilna, in enumerating the Polish historians, remarked that Lelewel was undoubtedly at their head, though, he sarcastically added in reference to his style which in his early days was somewhat eccentric, that it was a pity his works were not "done into Polish." The list of his productions is a very long one, Straszewicz in his book on the 'Poles of the Revolution,' published in 1833, enumerates eighty distinct articles, commencing with an 'Examination of the Edict,' published in 1807, many of them distinct publications, and others dissertations of some length in the 'Transactions' of Polish academies, and in periodicals, to which he adds a hundred and fifty maps, designed and engraved by Lelewel's own hand, to secure the accuracy which it appears cannot be expected from ordinary map-engravers. The main object of Lelewel's ambition was to compose a standard history of Poland on a large scale, but from his advanced age it cannot be expected that he will ever be able to accomplish this aim. In a short 'History of Poland, as related by an uncle to his nephews,' he has however embodied in an abridged shape his general views of the whole subject, and he has marked out some portion of his plan at length. In his 'Polska wieków srednich' ('Poland of the Middle Ages') 4 vols. 8vo (Posen, 1846-51) he has brought together rather in the shape of historical dissertations than of historical narrative, a vast body of observations which appear to be based on a careful study of all the contemporary historians of the large tract of time over which the subject is carried. In his 'Narody na ziemiach Slawianskich przed powstaniem Polaki' ('Nations on the Slavonic soil before the rise of Poland'), Posen, 1853, 8vo, he treats of the subject which Naruszewicz, who may be called the Hume of Polish literature, found so difficult, that he published a history of Poland beginning with the second volume. If to these works be added the 'Rozbiory Dziel,' or 'Reviews of works treating of Polish history,' (Posen, 1844, 8vo), collected by Lelewel from various publications in which he had inserted them at different times, a body of history will be found, on which the future fame of Lelewel will probably rest. His more popular reputation is owing to the already mentioned 'History of Poland related by an uncle,' his 'Poland Re-born,' his 'Reign of Stanislas Augustus,' his 'Novviltsov at Wilna,' and other works of the same kind, in which the foreign reader finds rather the warmth of the pamphleteer than the impartiality of the historian. These latter works have made their appearance in a French dress at Brussels, Lille, and elsewhere, translated by different Polish emigrants. Lelewel has himself written several French dissertations on subjects of numismatics, and some larger works, of which 'La Numismatique du Moyen Age' (Paris, 1835, 2 vols. 8vo), and 'Études Numismatiques' (Brussels, 1840, 8vo), testify to a wide erudition, sometimes in fault on minor points but fruitful of new and extended views. Mediæval geography is another of his favourite studies, and has been treated in perhaps his most important production, 'La Géographie du Moyen Age' (four volumes in three, Brussels, 1850-52, 8vo, with an atlas of 50 plates entirely engraved by himself). It is wonderful to observe in this work

the constancy and the energy with which the author, approaching his seventieth year in poverty and exile, has devoted himself to researches which are generally the luxury of a learned leisure. As a bibliographer Lelewel is also a writer of note, but his work on the subject was an early one. Much information not to be found elsewhere is contained in his 'Bibliograficznyh Ksiąg Dwoje,' ('A Pair of Books of Bibliography') 2 vols. 8vo, Wilna, 1823-26, in which he enters at length into the history of printing and of libraries in Poland, and has some judicious observations on the arrangement and cataloguing in libraries, objects to which his attention had been drawn when in early life librarian for a short period of the University library of Warsaw.

LELY, SIR PETER, or PETER VANDER FAES, was born in 1617, at Soest in Westphalia. He was placed, at what age does not appear, under Peter Grebber at Haarlem, an artist of considerable merit, whose school was in high esteem, and with whom he continued two years. Lely acquired great reputation by his portraits, and was appointed state painter to King Charles II., who probably became acquainted with him when he was in Holland. He is especially admired for his talent in giving a pleasing representation of female beauty. His pencil was light and delicate, his colouring beautiful, the tone warm, clear, and full, and his execution often spirited. The airs of his heads and his figures are graceful, and the attitudes easy though somewhat affected; and it must be confessed that he too frequently conveys an expression considerably removed from mental purity or delicacy. The hands of his figures are painted with remarkable care and delicacy. His draperies are arranged, with an appearance of negligence, in broad folds. He sometimes gave his pictures a landscape background in a style well calculated to give relief to his figures. He occasionally painted historical pictures, one of the best of which is a representation of 'Susannah and the Elders,' at Burleigh House. His most celebrated performance is the series of portraits of the beauties of the Court of King Charles II., preserved at Hampton Court, and in which his immodest pencil found ample scope. Lely equally excelled as a crayon painter, and his portraits in that style are esteemed little inferior to his paintings in oil. He died in England in 1680, at the age of sixty-three.

LEMOINE, FRANÇOIS, a celebrated French painter of the 18th century, was born at Paris in 1688. He was the pupil of Louis Galloche, early distinguished himself, and in 1718 was elected a member of the Royal Academy of Painting; his presentation-piece was an excellent picture of Hercules killing Cacus. He obtained a great reputation by his painting, in oil, of the 'Transfiguration of Christ' on the ceiling of the choir of the church des Jacobins, Rue du Bacq. In 1724 Lemoine visited Italy, where he remained for a year; the artists whose works chiefly attracted his attention were Pietro da Cortona, Lanfranco, and Bernini. After his return to France he was made professor of painting in the Academy, and in a very few years his reputation surpassed that of all his Parisian contemporaries. Louis XV. appointed him in 1736 his principal painter, with a salary of 4100 francs, in the place of Louis de Boullogne, deceased. The first of Lemoine's great works was the cupola of the chapel of the Virgin in St. Sulpice, in fresco, which he commenced in 1729—a work of three years' labour. His master-piece however is the 'Apotheosis of Hercules,' painted in oil on canvas pasted on the ceiling of the Salon d'Hercule at Versailles, commenced in 1732 and finished in 1736. It is a composition on a grand scale, containing 142 figures, but in a florid and superficial style, and, like the works of his model, Pietro da Cortona, belongs to the class of works called "pittura di macchina" by the Italians. The composition is arranged in nine groups, is vigorous and effective in arrangement, colour, and light, and especially in aerial perspective; but it is a purely decorative work, and is effective only as a whole: the parts have little individual merit, and the drawing wants correctness, expression, and distinctive character. Lemoine used on the ground of this picture—the blue vault of heaven—ultramarine to the value of 10,000 francs: it is sixty-four feet by fifty-four.

After the completion of this great work he was without a rival in France, but he never enjoyed his success. He was naturally of a melancholy temperament, which the loss of his wife, and vexation arising from the detractions of his less successful contemporaries, aggravated to such a degree that it amounted to a chronic aberration of intellect, and he destroyed himself in one of these nervous fits, June 4th, 1737, ten months after the termination of his great work at Versailles.

Lemoine painted also many easel-pieces, both of large and of very small dimensions, and the latter have realised high prices at auctions: a 'Flight into Egypt' is considered his best easel-piece. Many of his works have been engraved by some of the best French engravers, as L. Cars, N. Cochin, H. S. Thomassin, Silvestre, Larmessin, Et. Fessard, &c. Boucher, Natoire, and Nonotte, distinguished painters, were the pupils of Lemoine.

• LEMON, MARK, author, dramatist, &c., was born in London November 30th, 1809, and educated at the grammar-school, Cheam, Surrey. Mr. Lemon is a distinguished exception to the common-place discovery of biographies—that the man who is the subject, originally misappreciated his own genius. On the contrary, Mr. Lemon's earliest literary efforts (childish tragedies of course excepted) were in the lighter drama; and by these, and by later successes of the same kind,

he is best known. He is the author of about sixty plays of various description, farces and melodramas principally; in many of which his labours were shared by Mr. Henry Mayhew. 'The School for Tigers,' 'The Serious Family,' 'The Ladies Club,' and many of the remaining fifty-seven need not be mentioned to the present generation; and if the future does not hear of them it will be the defect of the system of writing plays for particular actors. On the establishment of 'Punch,' Mr. Lemon became one of its editors, and in two years afterwards sole editor. His name is familiar to the public from the pages of the 'Illuminated Magazine' and other serials, some of his contributions to which have since been collected and republished under the modest title of 'Prose and Verse.' Mr. Lemon has also published 'The Enchanted Doll,' a Christmas fairy tale for children. He is literary editor of, and a large contributor to, the 'Illustrated London News,' where 'M. L.' may constantly be found appended to pleasant sketches and graceful verses.

LENFANT, NINON DE, was born in 1616, of a noble though not very rich family of Touraine. Her mother wished to make her a nun, but her father, who was a man of pleasure, directed his daughter's ideas in a very different course, giving her very loose notions of morality, and preparing her to be, what she became in reality, a devotee to sensual gratification. She lost both her parents at an early age, and finding herself her own mistress, with a moderate independence, she fixed her residence at Paris. Being remarkably handsome and graceful, she was courted by most of the noblemen and wits about court, was very indulgent to all whom she liked, and had a numerous and often renewed succession of favourites. She is said to have been perfectly disinterested in her amours, being herself above want, and having neither ambition nor a passion for hoarding money. Such was the tone of morality in France in that age, that modest women courted her society, which was considered a model of elegance and fashion; among others, Madame de la Fayette, Madame de Sully, and Madame Scarron (afterwards Madame de Maintenon), often visited her. Christina of Sweden, during her residence in France, was much pleased with her company, and wished to attach her to her little court; but Mademoiselle de l'Enclos preferred her independence. She is said to have retained her attractions to a very advanced age, and to have been the object of a violent attachment at seventy. She was good-tempered and liberal, witty and accomplished. Some of her letters to St. Evremond, which are found in the works of that author, and have been published separately in the 'Lettres de Femmes Célèbres,' edited by L. Collin, 1805, are the only authentic memorials of her pen; other works have been attributed to her, which are apocryphal. She died in Paris in 1706, at ninety years of age.

LENFANT, JACQUES, was born at Bazoche in Beaura, a district of the ancient province of Orléannois in France, on the 13th of April 1661, and was the son of Paul Lenfant, the Protestant minister of Châtillon-sur-Seine. Being destined to the same profession as his father, he was sent to prosecute his studies at Saumur; and during his residence at that university he lived with the learned Jacques Cassel, the professor of Hebrew, with whom he formed a friendship which continued during their lives. He completed his theological education at Geneva and Heidelberg, in which latter town he was admitted into the ministry of the Protestant church during the month of August 1684. Soon after his ordination he obtained the appointment of minister of the French church at Heidelberg, and chaplain to the Dowager Electress Palatine. The invasion of the Palatinate by the French troops, under Marshal Turenne [TURENNE], compelled Lenfant to leave Heidelberg in 1688, and he settled at Berlin. The fear of meeting his countrymen arose from having rendered himself obnoxious to the Jesuits by two letters which he had written against that society, and which are appended to his work entitled 'A Preservative against a re-union with the Church of Rome.' Though the Protestant French church of that city had already a sufficient number of pastors attached to it, the reigning Elector of Brandenburg, Frederic, afterwards King of Prussia, who knew Lenfant by reputation, appointed him to that church, where for upwards of thirty-nine years he performed duty. In the year 1705 he married Mademoiselle Gourgaud de Verones, a French lady from Poitou. In 1707 he visited England, and it is said that he was admitted to preach before Queen Anne; it is further stated that the queen wished him to enter the Church of England, and offered him, in case he resolved to do so, to appoint him her chaplain. In 1710 he obtained the situation of chaplain to the King of Prussia, and councillor of the high consistory. Lenfant was suddenly attacked with paralysis, while in the apparent enjoyment of perfect health, on the 29th of July 1728, and he died on the 7th of August following.

His disposition is represented to have been extremely amiable, and his manner simple and modest. Of a reflective turn of mind, he spoke but little, and that little well. Though a most voluminous writer, he was fond of society, and opened himself without reserve to the confidence of his friends. As a preacher, his manner was pleasing and persuasive; the matter of his discourse was chiefly of a practical nature, and his eloquence was rather chaste than energetic. The style of his writing is elegant, though never florid; it has less force than that of Jurieu [JURIEU], and less eloquence than that of Saurin [SAURIN], but the French is more pure, and the diction more chaste. It is not certain whether he was the first to form the design

of the 'Bibliothèque Germanique,' which was commenced in 1720, but he took a prominent part in its execution, and he is the acknowledged author of the preface.

Lenfant's first work, which appeared in 1683, was a review of one of Erucy's, who, though a celebrated French dramatist, has written several theological works in defence of the Roman Catholic faith. In 1688 he published a translation of a selection from the letters of St. Cyprian, in 1690, a defence of the Heidelberg catechism, which is generally annexed to his 'Preservative,' &c., a work we have before alluded to; and in 1691, a Latin translation of the celebrated work of the Père Mallebranche on 'Research after Truth.' His history of the female Pope Joan appeared in 1694; the arguments in it are drawn from the Latin dissertation on that subject of Spanheim. It is said however that, in after life, Lenfant discovered and acknowledged the absurdity of this fiction. [JOAN, POPE.] In 1708 appeared his remarks on the Greek edition of the 'New Testament,' by Mill, which are in the 'Bibliothèque Choisie' of Le Clerc, vol. xvi. The following works afterwards appeared in succession: 1, 'Réflexions et Remarques sur la Dispute du Père Martianus avec un Juif;' 2, 'Mémoire Historique touchant la Communion sur les deux Espèces;' 3, 'Critique des Remarques du Père Vavasseur; sur les Réflexions de Rapin touchant la Poétique;' 4, 'Réponse de Mons. Lenfant à Mons. Dartis au sujet du Socinianième.' The above short works are to be found in the 'Nouvelle de la République des Lettres,' a review to which Lenfant was a frequent contributor.

In 1714 was published his learned and interesting 'History of the Council of Constance,' 2 vols., Amsterdam. Two years after he wrote an apology for this work, which had been severely attacked in the 'Journal de Trévoux.' In 1718, in conjunction with Beausobre, he published a translation of the New Testament, with explanatory notes, and a long and most learned introduction. It is by this work, perhaps, that he is most known in England. [BEAUSOBRE.] We shall now briefly mention the most important of his other productions: 1, 'Poggiana; or the Life, Character, and Maxims of the celebrated Florentine writer Poggio,' Amsterdam, 1720 [BRACCIOLETTI]; 2, 'A Preventive against Reunion with the See of Rome, and Reasons for Separation from that See,' Amsterdam, 1723—a work which continues to enjoy great popularity among Protestants; 3, 'History of the Council of Nice, and of the most remarkable Events during the Interval between it and the Council of Constance,' a learned and accurate work, written with sufficient impartiality, 1724; 4, 'A Volume containing sixteen Sermons, on different Texts of Scripture,' 1728; 5, 'A General Preface to the Old and New Testaments,' which is appended to the French Bible in octavo, published at Hanover and Leipzig in 1728; 6, 'A small volume of Remarks on Glabert's Treatise on Pulpit Eloquence.' The last work of Lenfant is one which has greatly added to his already high reputation, 'The History of the Wars of the Hussites, and of the Council of Basel,' 1728. He had been many years collecting materials for this valuable history, and had access, through the influence of the King of Prussia, to the archives of the corporation of Basel. The principal details of the life of Lenfant have been taken from a memoir annexed to the above work.

LENNEP, JACOB VAN, often called the 'Walter Scott' of Holland, was born at Amsterdam on the 25th of March 1802. His father, David Jacob van Lennep, born at Amsterdam on the 15th of July 1774, was not only one of the first classical scholars of his country, but a distinguished poet in his native language, and an orator of high reputation as a deputy to the states-general. He published editions of the 'Anthologia Græca,' of Hesiod and of Ovid, and was for fifty-four years professor of classical literature at the Athenæum of Amsterdam. He died on the 10th of February 1853. The younger Van Lennep first emerged into notice shortly before 1830, by a series of poems, entitled 'Vaderlandsche Legendes,' embracing some of the leading traditions of Holland treated in the style and manner of Walter Scott, and in his favourite eight-syllable metre, which is as well adapted to the Dutch language as to our own. Soon after, in 1830, when the Belgian outbreak had among other effects produced a temporary desertion of the Dutch theatres, from the attention of the public being irresistibly attracted for a time to political subjects alone, he wrote a little political farce, 'Het Dorp aan de Grenzen,' ('The Village on the Frontier'), which had the most amazing success in filling the theatre, and which was followed in 1831 by another 'Het Dorp over die Grenzen,' or 'The Village over the Frontier.' From that time to the present he has been one of the most popular authors of Holland, and his pen has been seldom inactive. The number of his separate works is over fifty, and in very many of them Walter Scott has his prototype. A series of novels under the title of 'Onze Voorouders' ('Our Forefathers') embraces the whole romance of Dutch history. Of several separate novels of the same character, 'The Rose of Dekama,' one of the most popular, was translated into English by Woodley (London, 1847), and 'The Adopted Son' ('De Pleegzoon') by Hoskins (New York, 1847). A set of volumes of the 'History of the North Netherlands,' as related to his children, reminds the reader of 'Tales of a Grandfather,' and a 'Description of the Old Castles of Holland,' of the 'Border and Provincial Antiquities.' Nor is Walter Scott the only English poet to whom Van Lennep has given attention, one of his early works was

a translation of the 'Siege of Corinth;' he has imitated with admirable success Southey's 'Cataract of Lodore;' and has read in public in Holland a translation of Tennyson's 'May-Queen,' which has always had the effect of drawing tears. Van Lennep is as might be expected a perfect master of our language, and has paid frequent visits to England, one of which in 1849 when he attended the Salisbury meeting of the Archaeological Institute, he has recorded in the volume for 1850 of 'Holland,' an annual published under his editorship. A splendid edition of his dramatic works was commenced in 1852, comprising tragedies, farces, and several operas, one of which is founded on Scott's 'Harold the Dauntless.' In the third volume published in 1854 are close translations of 'Romeo and Juliet,' and 'Othello,' so close indeed that the translator takes occasion to say, that though he had seen Miss Smithson, Miss Kelly, and Miss Davenport in the part of Juliet, he had never seen the play of Shakspeare represented till he saw this version of it on the Amsterdam stage; "for it should be known," he remarks, "that the English in spite of their apotheosis of the great tragic poet, silently permit his immortal works to be brought on the stage altered—and of course spoiled." The reception of 'Romeo and Juliet' at Amsterdam, where it was produced in 1852, was however very indifferent, and that of 'Othello,' appears to have been of much the same character. About the same time a close translation of the 'Merry Wives of Windsor' failed entirely at St. Petersburg. He has now been for some years engaged in editing a grand edition of Vondel, the great Dutch contemporary of Dryden, who was edited by Scott. In the midst of all this literary activity he is by profession a lawyer, and in that respect surpasses Scott, being a lawyer in extensive practice, and holding high professional offices. He is married, has a large family, and is universally popular with his countrymen. Of late years his warm patriotic attachment to Holland, which was shown not only in his writings, but in his exertions as a volunteer in the campaign of 1831, has not prevented his being an active promoter of the friendly intercourse between Holland and Belgium by the annual meetings of the literary men of the two countries, held first in one country, then in the other. At these meetings his social and other talents have been very conspicuous.

LENNEP, JOHN DANIEL VAN, was born at Leeuwarden, in the province of Friesland in Holland, in November 1724, and was educated at the University of Franeker. In 1747 he edited a Greek poem by Coluthus, which was favourably received by his learned contemporaries. He was elected in 1752 professor of Latin and Greek at Groningen, and after remaining there fifteen years, was appointed to a similar professorship at Franeker. He died the 6th of February 1771, at Aix-la-Chapelle, whither he had gone for the benefit of his health.

Lennep is principally known by his 'Etymologicum Lingue Græcæ,' which was published after his death, by his pupil Scheide, 2 vols. 8vo, Utrecht, 1790; it was reprinted in one volume in 1808, under the superintendence of Nagel. This work used to be considered by many scholars a standard book on Greek etymology; but since the study of etymology has been pursued on sound principles, it has been justly regarded as a useless book, full of errors and absurdities. The views of Lennep on etymology in general, and especially on that of the Greek language, are given in a treatise of his entitled 'De Analogia Lingue Græcæ,' published by Scheide, in the 'Prælectiones Academicæ' of Lennep and Volckenaer, 8vo, Utrecht, 1790. Lennep was engaged at the time of his death in editing the 'Epistles of Phalaris,' and translating into Latin Bentley's celebrated 'Dissertations on those Epistles.' This work, together with the translation of Bentley, was published in 1777, under the superintendence of Valckenaer, who has given in the preface a brief account of the life and writings of Lennep.

LEO I., Emperor of Constantinople, born in Thrace of obscure parents, entered the military service and rose to high rank. At the death of the Emperor Marcianus in A.D. 457, he commanded a body of troops near Selymbria, and was proclaimed emperor by the soldiers, at the instigation of Aspar, a Gothic chief, who commanded the auxiliaries. The senate of Constantinople confirmed the choice, and the patriarch Anatolius crowned him. This is said to have been the first instance of an emperor receiving the crown from the hands of a bishop. Leo followed the measures of Marcianus against the Eutybians, who had been condemned as heretics, and who had recently excited a tumult at Alexandria, had killed the bishop, and placed one Ælurus in his stead. Aspar for a time screened Ælurus; but Leo at last had him exiled, and an orthodox bishop put in his place. The Huns, having entered the province of Dacia, were defeated by the imperial troops, and a son of Attila was killed in the battle. Soon after, Leo, in concert with Anthemius, emperor of the West, prepared a numerous fleet, with a large body of troops on board, for the recovery of Africa, which was occupied by the Vandals. Part of the expedition attacked and took the island of Sardinia; the rest landed in Libya, and took Tripolis and other towns; but the delay and mismanagement of the commander, who was Leo's brother-in-law, gave time to Genseric to make his preparations. Coming out of the harbour of Carthage by night, with fireships impelled by a fair wind, he set fire to many of the imperial ships, dispersed the rest, and obliged the expedition to leave the coast of Africa.

Leo gave his daughter Ariadne in marriage to Zeno, an Issaurian,

whom he made patrician and captain of his guards, in order to balance the power of Aspar, whose fidelity he had reason to suspect, and whom he afterwards caused to be put to death as a conspirator. The auxiliary Goths rose to avenge Aspar's death, and it was with difficulty that Leo overpowered them. Leo died in January 474, bequeathing the throne to his grandson Leo, the child of Zeno and Ariadne.

LEO II. was four years of age when he was proclaimed, and the people seemed to approve of the choice; but Ariadne and her mother, the empress Verina, having determined to place Zeno on the throne, induced the child one day while in public to place a crown on his father's head and call him his colleague. Young Leo died after a nominal reign of ten months, and Zeno himself was suspected of having procured the death of his own child.

LEO III., called Isauricus, from the country of his birth, was of humble parentage, and served in the army under Justinian II. Under the reign of Anastasius II. he received the supreme command of the troops of Asia. After Anastasius was deposed and Theodosius III. proclaimed in his stead in 716, Leo would not acknowledge the latter, but marched to Constantinople, when Theodosius resigned the crown to him in March 717. The Saracens soon after, coming in large numbers by sea and by land, laid siege to Constantinople, when the new emperor came out of the harbour with some fire-ships, which, being impelled by a fair wind among the enemy's fleet, threw it into confusion and destroyed many of their ships. The severe winter which followed killed most of the horses and camels of the Saracens, and in the course of the next summer Leo, having defeated them by land, obliged them to raise the siege. It was during this long siege that Sergius, governor of Sicily, thinking the empire at an end, made himself independent; but Leo sent a new governor to assert his authority, and the rebels were punished. In 719 Anastasius, having attempted to resume the crown, was beheaded. Thus far Leo had shown himself to be a brave and able sovereign, but unfortunately, like many of his predecessors, when he began to mix in religious controversy he became tyrannical and cruel. The new religion of the Koran abhorred the worship or even the use of images; the Jewish law likewise strictly forbade it as leading to idolatry; and this principle thus asserted by these creeds found its way among the Christians of the east, and was adopted by Leo, who, now believing that the use of images in the churches was contrary to religion, issued an edict, ordering their immediate removal. The Patriarch of Constantinople and most of the Greek clergy remonstrated against this measure, and the pope, Gregory II., condemned the edict of Leo as heretical. This was the beginning of the schism of the Iconoclasts, or 'image-breakers,' which caused great calamities to the empire, and contributed to its losing Italy, as the Italians, supported by the pontiff, refused to obey the edict, while Leo resorted to violence, which irritated the people still more. It was asserted that a conspiracy against the life of the pope was hatched at Rome by the Greek officers there, and supported by the Exarch of Ravenna; but the people of Rome rose and killed some of the Greeks, and a general insurrection took place over Italy against the emperor, of which the Longobards availed themselves to extend their dominions, and occupied the port of Classe near Ravenna. Even in the east Leo found the greatest opposition among his subjects, who were much attached to the images. The islands of the Archipelago revolted, and even sent a fleet to threaten the capital, but the Greek fire dispersed it. Great tumults broke out at Constantinople on account of the removal of the images according to the order of the emperor; several persons were killed in the confusion, and others were sentenced to death for having excited the mutiny; the patriarch Germanus was deposed, and another prelate favourable to the Iconoclasts was put in his place. Gregory II. having died in 731, his successor, Gregory III., assembled a council at Rome in the following year, in which the Iconoclasts were condemned. A messenger who was despatched to the emperor with the decree of the council was detained in Sicily and not allowed to proceed. Leo, in his wrath against the pontiff, detached from the Roman patriarchate the sees of Illyricum, of Calabria, and Sicily, and placed them under the Patriarch of Constantinople. Meantime the Saracens were making great progress in Asia Minor, and they conquered the whole of Paphlagonia. In the midst of his unsuccessful struggle both against the Saracens of Asia and against the Italians and the pope, Leo died of the dropsy in the year 741, and was succeeded by his son Constantine, called Copronymus, also a zealous Iconoclast, who had married Irene, the daughter of a prince of the Gazari, a Turkish tribe.

LEO IV., son of Constantine Copronymus, born at Constantinople in 751, succeeded his father in 775. His disposition was milder than that of his father, but like him he was a decided adherent of the Iconoclastic tenets; and he banished many of the old, or, as they called themselves, the orthodox party, whence much odium has been heaped upon his memory. He died in 780, and was succeeded by his son Constantine VI., under the regency of the Empress Irene.

LEO V., called the Armenian, because his father was from that country, held a command in the army under the reign of Nicephorus, but being accused of treason he was confined in a convent. Michael Rangabé, on ascending the throne in 811, gave him his pardon and restored him to his rank. Leo however was too ambitious to be grateful. After obtaining some success against the Saracens, he accompanied Michael on an expedition against the Bulgarians, in which he

is charged by the historians with betraying his master, and causing the loss of the battle near Adrianople. Being left by Michael in charge of the remains of the army, he urged them to rebel, and being proclaimed emperor by them he marched to Constantinople. Michael made no resistance, but sent to his successor the crown, sceptre, and other imperial insignia, and retired into a convent. Leo entered the capital in July 813, and was crowned at St. Sophia by the patriarch Nicephorus. The Bulgarians having invaded the empire and threatened Constantinople, Leo took the field, defeated them at Messembria in 814, and in the next year he obliged them to sue for peace. Leo, like his predecessors, was an Iconoclastic, but such was the fanaticism of the people in favour of their images, that they willingly exposed their lives for them. It is a remarkable fact, that about the same time the abuse of the images attracted the attention of the Western Church. An assembly of western bishops took place at Paris in the year 824 to examine the subject of the worship of images, to which the opinion of those prelates was not altogether favourable. Leo however, like his Iconoclastic predecessors, went to the extreme, fancying that the only means of correcting the abuse was by destroying the images altogether: he exiled the patriarch Nicephorus, who would not consent to an Iconoclastic proscription, and he put to death many who were on the same side, which was that of the mass of the people and clergy, and especially the monks, who had great influence in the eastern empire. Persecution and discontent prepared the way for conspiracies. Michael, surnamed the Stammerer, who had contributed to Leo's elevation, and had been consequently made a patrician, raised his thoughts towards the empire. He was arrested, convicted of treason, and condemned to death; but his friends, having disguised themselves as priests, introduced themselves into the chapel of the palace, where Leo used to attend matins, and on a given signal, as the emperor began chanting a new psalm, they fell upon him and killed him, in spite of his desperate resistance, in 820. On learning this catastrophe in the place of his exile, the patriarch Nicephorus exclaimed, "The Church is freed from an enemy, but the state has lost an able prince." Michael the Stammerer succeeded to the throne.

LEO VI., styled the Philosopher, probably on account of his writings, for his conduct gave him no claims to the appellation, was the son of the Emperor Basilus the Macedonian, whom he succeeded in 886. His brother Alexander was his nominal colleague, but through indolence left the government entirely to Leo. The reign of Leo, which lasted twenty-five years, was not a prosperous or glorious one for the empire, for while the armies were beaten both by the Saracens and Bulgarians, the capital and the palace were disturbed by the intrigues and excesses of the courtiers, and by the emperor's own irregularities. He again exiled the turbulent Photius, whom his father had reinstated in his see. In the year 904 the Saracens took and plundered Thessalonica, one of the principal cities of the empire, and carried away its inhabitants into slavery. Leo died in 911, at forty-six years of age, leaving the crown to his son Constantine Porphyrogenitus, whom he had by his fourth wife Zoe. Although not a deserving sovereign, Leo ought to be remembered as an author; he completed and published the Basilica, or Greek compilation of the laws of the empire, undertaken by his father, and extracted it in great measure from the Justinian body of laws. It does not seem to be ascertained however whether the work has descended to us as it was completed by Leo, or as it was afterwards reformed by his son Constantine. Leo wrote also a treatise on Tactics, which has been published by Meursius; and a collection of Oracles or Prophecies (for he laid claim to an insight into futurity), which has also been published; a poem on the calamities of Greece, other verses, moral orations, &c.

LEO I. was only a deacon when he was chosen by the clergy and people of Rome to be their bishop, after the death of Sixtus III., 440, under the reign of Valentinian III., emperor of the West, and Theodosius II., emperor of the East. He was a man of learning, and well acquainted with the world and with state affairs, having been employed on several missions by the imperial court. In his youth he had been acquainted with St. Augustine, and had profited by his instruction and example. Soon after his exaltation he had a controversy with Hilarius, bishop of Arelate (Arles) in Gaul, who had deposed Celdionius, bishop of Vesontio (Besançon), because he had married a widow, which was forbidden by the canons. Celdionius however appealed to Leo, who reinstated him in his see. Hilarius was summoned to Rome upon several charges brought against him by other bishops of Gaul, to whom his severity was obnoxious; and Leo obtained a rescript from the emperor Valentinian III., suspending Hilarius from his episcopal office. This suspension however does not appear to have been lasting, although the fact has been taken hold of by controversial writers as a stretch of jurisdiction in the see of Rome. Quezel published a dissertation upon this controversy in his edition of the works of Leo, Paris, 1675. Leo also induced the emperor to issue, in the year 445, several laws against the Manichæans and other heretics, depriving them of the right of citizenship and of inheritance, and excluding them from the military service. He assembled a council at Rome in 449, in which he annulled the acts of the council of Ephesus, which had absolved Eutyches. [EUTYCHES.] Soon afterwards the Ecumenic council of Chalcedon, 451, in which Leo's legates presided, condemned the doctrine of Eutyches, and

defined the doctrine concerning the person of Christ. By a canon of this council, which was œcumenic, or universal, both for the East and West, the Bishop of Constantinople was declared to be next in place, though equal in dignity, to the Bishop of Rome, and the limits of their respective jurisdictions were determined, the patriarchates of Antioch and Alexandria being placed under that of Constantinople; which canon passed the assembly, notwithstanding the opposition of the Roman legates. The story of Leo stopping Attila on his march, and persuading him to spare the city of Rome, is an embellishment; but it appears that Leo was really sent by Valentinian on a mission to Attila, who was then devastating Lombardy, and that Attila consented to a truce with Valentinian, after which he recrossed the Alps. Some years after, Leo did prevail upon Genseric, who had landed at the mouth of the Tiber 455, to spare at least the lives and the buildings in Rome, and not to allow his Vandals to set fire to that city or slaughter the inhabitants. Genseric was satisfied with the plunder of Rome, and returned to Africa. Leo died in 461, and was succeeded by Hilarius I. His writings, especially his Sermons and his Epistles, are useful for the history of the times. Quesnel has given a full account of his life, as well as Maimbourg, 'Histoire du Pontificat de St. Léon le Grand.' Father Cacciari published an edition of Leo's works, 3 vols. folio, Rome, 1751-55, in which he has charged Quesnel's edition with great incorrectness. Leo's Sermons have been translated into French by the Abbé de Bellegarde, Paris, 1701. The Roman church numbers him among its saints, and gives him also the epithet of Magnus, or "St. Leo the Great."

LEO II., a native of Sicily, succeeded Agathon in the see of Rome in 682. He put an end to the schism between the see of Ravenna and that of Rome, it being agreed that the bishops of Ravenna should receive their ordination at Rome, but that they should be exempted from the payment of money which had been exacted from them on receiving the pallium. Leo died in 683, and was succeeded, after a vacancy of nearly a year, by Benedict II.

LEO III., a native of Rome, was elected after the death of Adrian I. in 795. He immediately communicated his election to Charlemagne, to whom he, like his predecessor, acknowledged allegiance. Charlemagne replied by a letter of congratulation, which he entrusted to the abbot Angilbertus, whom he commissioned to confer with the new pontiff respecting the relations between the see of Rome and the "Patrician of the Romans," for this was the title which Charlemagne had assumed. In 796 Leo sent to Charlemagne the keys of St. Peter and the standard of the city of Rome, requesting the king to send some of his nobles to administer the oath of allegiance to the people of Rome. The dominion of Charlemagne over the city and duchy of Rome is attested by Paulus Diaconus, who says that "Charles added to his other sceptres that of the city of Romulus." In the year 799, an atrocious assault, the motive of which is not clearly ascertained, was committed on the person of the pope. While Leo was riding on horseback, followed by the clergy, and chanting the liturgy, a canon of the name of Paschal and a scirian called Campulus, accompanied by many armed ruffians, fell upon him, threw him down from his horse, and dragged him into the convent of St. Sylvester, when they stabbed him in many places, endeavouring to pull out his eyes and cut out his tongue. In this however it seems that they did not succeed, as Leo was delivered by his friends from the hands of the assassins, and taken to Spoleti under the protection of the Duke of Spoleti, where he soon after recovered, and was enabled to travel as far as Paderborn in Germany, where Charlemagne then was, by whom the pope was received with the greatest honour. Charlemagne sent him back to Rome, with a numerous escort of bishops and counts, and also of armed men. The pope was met outside of the city gates by the clergy, senate, and people, and accompanied in triumph to the Lateran palace. A court, composed of the bishops and counts, proceeded to the trial of the conspirators who had attempted the life of the pope; and the two chiefs, Paschal and Campulus, were exiled to France. From this very lenient sentence, and other concomitant circumstances, it appears that Charlemagne had greatly at heart to conciliate the Romans in general, in order to deter them from betaking themselves again to the protection of the Greek emperors.

In 800 Charlemagne himself visited Italy, and was met at Nomentum, outside of Rome, by the pope; and the next day he repaired to the Basilica of the Vatican, escorted by the soldiers and the people. After a few days Charlemagne convoked a numerous assembly of prelates, abbots, and other persons of distinction, Franks as well as Romans, to examine certain charges brought against the pope by the partisans of Paschal and Campulus; but no proofs were elicited, and Leo himself, taking the book of gospels in his hand, declared himself innocent. On Christmas-day of that year the pontiff officiated in the Basilica of the Vatican, in presence of Charlemagne and his numerous retinue. As Charlemagne was preparing to leave the church, the pontiff stopped him, and placed a rich crown upon his head; while the clergy and the people, at the same moment, cried out "Carolo piissimo," "Augusto magno Imperatori," and other expressions and acclamations which were used in proclaiming the former Roman emperors. Three times the acclamations were repeated, after which the pope was the first to pay homage to the new emperor. From that time Charlemagne left off the titles of king and patrician, and styled himself Augustus and Emperor of the Romans; and he addressed the

emperor of Constantinople by the name of brother. Thus was the Western empire revived, 325 years after Odoacer had deposed Romulus Augustulus, the last nominal successor of the Caesars on the throne of the West. From that time all claim of the Eastern emperors to the supreme dominion over the duchy of Rome was at an end; and the popes from the same time assumed the temporal authority over the city and duchy, in subordination however to Charlemagne and his successors; they began also to coin money, with the pontiff's name on one side and that of the emperor on the other.

In the year 804 the pope went to pass the Christmas at the court of Charlemagne at Aquigrana (Aix-la-Chapelle), after which he returned to Italy. In the division which Charlemagne made by will of his dominions among his sons, the city of Rome was declared to belong to him who should bear the title of emperor. Louis le Debonnaire was afterwards invested with that title by Charlemagne himself, and we find him accordingly, after the death of his father, assuming the supreme jurisdiction over that city on the occasion of a fresh conspiracy which broke out against Leo, the heads of which were convicted by the ordinary courts at Rome, and put to death. Louis found fault with the rigour of the sentence and the haste of its execution, and he ordered his nephew Bernard, king of Italy, to proceed to Rome and investigate the whole affair. Leo, who seems to have been alarmed at this proceeding, sent messengers to the court of Louis to justify himself. Meanwhile he fell seriously ill, and the people of Rome broke out into insurrection, and pulled down some buildings he had begun to construct on the confiscated property of the conspirators. The Duke of Spoleti was sent for with a body of troops to suppress the tumult. Leo died in 816, and Stephen IV. was elected in his place. Leo is praised by Anastasius, a biographer of the same century, for the many structures, especially churches, which he raised or repaired, and the valuable gifts with which he enriched them. In his temporal policy he appears to have been more moderate and prudent than his predecessor, Adrian I., who was perpetually soliciting Charlemagne in his letters for fresh grants of territory to his see.

LEO IV. succeeded Sergius II. in 847. He was consecrated without waiting for the consent of the Emperor Lotharius, because of the urgency of the circumstances. Rome was then threatened by the Saracens, who occupied part of the duchy of Benevento, and who a short time before had landed on the banks of the Tiber, and plundered the Basilica of St. Peter's on the Vatican, which was outside of the walls. In order to prevent a recurrence of this violence, Leo undertook to surround the Basilica and the suburb around it with walls; and this being completed in four years, with the assistance of money sent by the emperor, and the produce of a tax levied upon all property in the duchy of Rome, the new town was called Leonina, a name which it has retained to this day. Leo also restored the town of Porto on the Tiber, near its mouth, settling there some thousands of Corsicans, who had run away from their country on account of the Saracens. Towers were built on both banks of the river, and iron chains drawn across to prevent the vessels of the Saracens from ascending to Rome. The port and town of Centum Cellæ being forsaken on account of the Saracens, Leo built a new town on the coast, about twelve miles distant from the other, which was called Leopoli; but no traces of it remain now, as the modern Civita Vecchia is built on or near the site of old Centum Cellæ. Leo died in July 855, and fifteen days after his death Benedict III. was elected in his place, according to the most authentic text of Anastasius, who was a contemporary; but later writers introduced between Leo IV. and Benedict III. the fabulous Pope Joan. [JOAN, POPE.]

LEO V., a Benedictine monk, succeeded Benedict IV. in 903. In less than two months he was violently superseded and imprisoned by a certain Christopher, who was his chaplain, and who assumed the pontifical office. But Christopher himself did not retain it long, as a new revolt of the Romans drove him from the usurped see, and put in his place Sergius III., who was the favourite of the celebrated Marozia, a powerful but licentious woman, who disposed of everything in Rome. The 10th century is the darkest era of the papacy. How the unfortunate Leo died is not mentioned; probably he died in prison.

LEO VI. succeeded John X. in 928, and died seven months afterwards; some say that he was put to death by Marozia, like his predecessor. He was succeeded by Stephen VII.

LEO VII. succeeded John XI., the son of Marozia, in 937. He mediated a peace between Alberic, duke of Rome, and Hugo, king of Italy, who had offered to marry Marozia, in order to obtain by her means the possession of Rome, but was driven away by Alberic, Marozia's son. Leo is said to have been a man of irreproachable conduct, but little else is known of him. He died in 939, and was succeeded by Stephen VIII.

LEO VIII. succeeded John XII., who was deposed for his misconduct, by a council assembled at Rome, in presence of the Emperor Otho I. in 963. But soon after Otho had left Rome, John XII. came in again at the head of his partisans, obliged Leo to run away, and resumed the papal office. John however died shortly after, and the Romans elected Benedict called V. Otho, returning with an army, took the city of Rome, exiled Benedict, and reinstated Leo, who died about 965, and was succeeded by John XIII.

LEO IX., BRUNO, Bishop of Toul, was appointed in 1049 to succeed Damasus II. at the joint recommendation of the Emperor Henry III.

and of the famous Hildebrand (afterwards Gregory VII.). He was continually in motion between Germany and Italy, holding councils and endeavouring to reform the discipline and morals of the clergy, and also to check the progress of the Normans in Southern Italy, against whom he led an army, but was defeated in Apulia and taken prisoner by the Normans, who treated him with great respect, but kept him for more than a year in Benevento. Having made peace with them by granting to them as a fief of the Roman see their conquests in Apulia and Calabria, he was allowed to return to Rome, where he died in 1054, and was succeeded by Victor II.

LEO X., GIOVANNI DE' MEDICI, the second son of Lorenzo the Magnificent, was born in December 1475. He was made a cardinal at the unusually early age of thirteen, by Pope Innocent VIII., who was very intimate with his father Lorenzo. After the death of Lorenzo in 1492, Cardinal de' Medici shared in the expulsion of his brothers, Piero and Giuliano, from Florence, in November, 1494. [MEDICI.] After fruitless endeavours to effect their restoration, Cardinal de' Medici gave up the attempt, and quitted Italy, which country was then ravaged by foreign arms, and betrayed by the wretched policy of Alexander VI. Cardinal de' Medici travelled through Germany and France, courting the acquaintance of men of learning, and displaying his own taste for literature and the liberal arts. After the death of Alexander VI. in 1503 he returned to Rome, where Julius II. employed him as legate with the army against the French. Being taken prisoner by the latter at the battle of Ravenna in April 1512, he was sent to Milan, but soon after effected his escape. The French being driven out of Lombardy, and the Florentine republic, with the Gonfaloniere Soderini at its head, being charged with partiality towards the foreigners, Cardinal de' Medici contrived to employ the arms of the allied powers in replacing him and his family in their former supremacy over their native country. A body of 5000 Spaniards, brave to ferocity, were marched under Raymond de Cardona against Florence in August 1512. On their way they stormed the town of Prato, and massacred the citizens, which so intimidated the Florentines that they immediately capitulated; and Cardinal de' Medici and his brother Giuliano soon after entered Florence, and forced the Signoria, or executive, to call a 'parlamento,' or general assembly of the people, in the great square, on the 16th of December. This general assembly of the sovereign people had repeatedly been used by ambitious men as a ready instrument of their views, and it proved such on this occasion. All the laws enacted since the expulsion of the Medici in 1494 were abrogated. A balia, or commission, was appointed, consisting of creatures of that family, with dictatorial powers to reform the state. No bloodshed however accompanied the re-action, but Soderini and other citizens opposed to the Medici were banished. Soon after, in March 1513, news came of the death of Julius II. at Rome, and Cardinal de' Medici hastened to the conclave, leaving his brother Giuliano and his nephew Lorenzo, son of Piero, at the head of the affairs of Florence.

Cardinal de' Medici was elected pope in March, 1513, at the early age of thirty-seven, when he assumed the name of Leo X. One of his first acts was to appoint two men of learning, Bembo and Sadoletto, for his secretaries. He next sent a general amnesty to be published at Florence, where a conspiracy had been discovered against the Medici, for which two individuals were executed, and others, with the celebrated Machiavelli among the rest, were arrested and put to the torture. Leo ordered Giuliano to release the prisoners, and recall those that were banished, and Soderini among the rest. Giuliano being invited to Rome, where he was made Gonfaloniere of the Holy Church, Leo appointed his nephew Lorenzo governor of Florence, and his cousin, Cardinal Giulio de' Medici, archbishop of the same. Florence was now a dependency of Rome, and such it continued during the remainder of Leo's life.

The pontificate of Leo X., though it lasted only nine years, forms one of the most memorable epochs in the history of modern Europe, whether we consider it in a political light as a period of transition for Italy, when the power of Charles V. of Spain began to establish itself in that country; or whether we look upon it as that period in the history of the Western Church which was marked by the momentous event of Luther's Reformation. But there is a third and a more favourable aspect under which the reign of Leo ought to be viewed, as a flourishing epoch for learning and the arts, which were encouraged by that pontiff, as they had been by his father, and indeed as they have been by his family in general, and for which the glorious appellation of the age of Leo X. has been given to the first part of the 16th century.

Leo found the war renewed in Northern Italy. Louis XII. sent a fresh army, under La Trimouille, to invade the duchy of Milan. The Swiss auxiliaries of Duke Maximilian Sforza defeated La Trimouille at Novara, and the French were driven out of Italy. The Venetians however had allied themselves with Louis XII., and Leo sent Bembo to Venice to endeavour to break the alliance. Differences broke out between Leo and Alfonso d'Este, duke of Ferrara, who demanded the restoration of Reggio, taken from him by Julius II., which Leo promised, but never performed; on the contrary, he purchased Modena of the Emperor Maximilian, disregarding the rights of the house of Este to that town. The Pope held likewise Parma and Piacenza, and it appears that he intended to form out of these a territory for his brother Giuliano, and he made attempts to surprise Ferrara also with

the same view. His predecessor, Julius, had in view the independence of all Italy, and he boldly led on the league for this purpose; Leo had a narrower object,—his own aggrandisement and that of his family,—and he pursued it with a more cautious and crooked policy.

Leo re-opened the council of the Lateran, which had begun under Julius II., for the extinction of the schism produced by the council of Pisa, which had been convoked by Louis XII., in order to check the power of that pope, who was his enemy. Circumstances were now changed, and Louis XII. made his peace with Leo in 1514, renounced the council of Pisa, and acknowledged that of the Lateran. Louis XII. died in the following year, and his successor Francis I., among his other titles, assumed that of Duke of Milan, which was the signal of a new Italian war. The Venetians joined him, whilst the Emperor Maximilian, Ferdinand of Spain, Duke Sforza, and the Swiss, made a league to oppose the French. The Pope did not openly join the league, but he negotiated with the Swiss by means of the cardinal of Sion, and paid them considerable sums to induce them to defend the north of Italy. The Swiss were posted near Susa, but Francis, led by old Trivulzio, passed the Alps by the Col de l'Argentier, entered the plains of Saluzzo, and marched upon Pavia, whilst the Swiss hastened back to defend Milan. The battle of Marignano was fought on the 14th of September 1515. The Swiss made desperate efforts, and would probably have succeeded, had not Alviano with part of the Venetian troops appeared suddenly with cries of "Viva San Marco," which dispirited the Swiss, who believed that the whole Venetian army was coming to the assistance of the French. The result was the retreat of the Swiss, and the entrance of the French into Milan, who took possession of the Duchy. Leo now made proposals of alliance to Francis, who eagerly listened to them, and they had a conference at Bologna in December 1515, in which a concordat was agreed upon, regulating the appointment to the sees and livings in the French kingdom, which concordat remained in force till the French Revolution. A marriage was also agreed upon between Lorenzo, the pope's nephew, and Madeleine de Boulogne, niece of Francis de Bourbon, duke of Vendôme, from which marriage Catherine de' Medici, afterwards Queen of France, was born.

In 1516 Leo, under some frivolous pretences, deprived Della Rovere, the nephew of Julius II., of his duchy of Urbino, Pesaro, and Sinigaglia, which he gave to his nephew Lorenzo de' Medici. Soon afterwards a conspiracy to murder the pope was discovered at Rome, and Cardinal Petrucci, who was at the head of it, was hanged. In 1517 the council of the Lateran was finally closed, and in the same year Leo authorised the sale of indulgences in Germany, which was the immediate cause of the Reformation. [LUTHER.] For some years after however Leo took little notice of the progress of Luther's opinions in Germany; and indeed to the end of his life Leo's mind appears to have been much more concerned with what occurred around him in Italy than with the remote controversy carried on in Saxony, the consequences of which he probably did not foresee.

In 1518 a league of five years was proclaimed by Leo among the Christian princes to oppose the advance of the Turks, who were threatening Italy. For this purpose the pope gave to the Christian princes the disposal of part of the revenues of the clergy, which they readily appropriated to themselves, without doing anything against the Turks.

Gian Paolo Baglione of Perugia, a celebrated condottiero, had seized upon the government of his native town. Leo cited him to appear at Rome, with promises however of safety for his person. Upon his arrival Baglione was arrested, put to the torture, made to confess many crimes, and at last beheaded. Perugia was then annexed to the Papal State, as well as the duchy of Urbino after the death of Lorenzo de' Medici, who left no male issue.

The alliance of Leo with Francis I. was a hollow one, each party mistrusting the other. At last Leo, thinking an alliance with the young monarch of Spain and Emperor of Germany was likely to be much more advantageous to him, concluded a secret treaty, offensive and defensive, with Charles V., on the 8th of July 1521, by which it was stipulated that the duchy of Milan was to be taken from the French and given to Francesco Maria Sforza, and Parma and Piacenza to be restored to the pope. Leo subsidised a body of Swiss, and Prospero Colonna with the Spaniards from Naples joined the Papal forces at Bologna, crossed the Po at Casalmaggiore, joined the Swiss, and drove the French governor Lautrec out of Milan. In a short time the duchy of Milan was once more clear of the French, and restored to the dominion of Sforza. Parma and Piacenza were again occupied by the Papal troops. Leo at the same time declared Alfonso d'Este a rebel to the Holy See for having sided with the French, whilst the duke on his part complained of the bad faith of the pope in keeping possession of Modena and Reggio. The news of the taking of Milan was celebrated at Rome with public rejoicings, but in the midst of all this Leo fell ill, on the 25th of November, and died on the 1st of December 1521, being forty-six years of age, not without suspicion of poison, though some have maintained that he died a natural death.

Leo was generous, or rather prodigal; he was fond of splendour, luxury, and magnificence, and therefore often in want of money, which he was obliged to raise by means not always creditable. He had a discerning taste—was a ready patron of real merit—was fond of

wit and humour, not always refined, and which at times degenerated into buffoonery: this was indeed one of his principal faults. His state policy was like that of his contemporaries in general, and not so bad as that of some of them. He contrived however to keep Rome and the Papal territory, as well as Florence, in profound peace during his nine years' pontificate—no trifling boon, whilst all the north of Italy was ravaged by French and Germans and Spaniards, who committed all kinds of atrocities. He was by no means neglectful of his temporal duties, although he was fond of conviviality and ease, and even his enemies have not substantiated any charge against his morals. He did not, and perhaps could not, enforce a strict discipline among the clergy or the people of Rome, where profligacy and licentiousness had reigned almost uncontrolled ever since the pontificate of Alexander VI.

The services which Leo rendered to literature are many. He encouraged the study of Greek, founded a Greek college at Rome, established a Greek press, and gave the direction of it to John Lascaris; he restored the Roman University, and filled its numerous chairs with professors; he directed the collecting of manuscripts of the classics, and also of Oriental writers, as well as the searching after antiquities; and by his example encouraged others, and among them the wealthy merchant Chigi, to do the same. He patronised men of talent, of whom a galaxy gathered round him at Rome. He employed Michel Angelo at Florence and Raffaele at Rome in the Vatican. He corresponded with Erasmus, Machiavelli, Ariosto, and other great men of his time. He restored the celebrated library of his family, which on the expulsion of the Medici had been plundered and dispersed, and which is now known by the name of the *Biblioteca Laurenziana* at Florence. In short, Leo X., if not the most exemplary among popes, was certainly one of the most illustrious and meritorious of the Italian princes.

(Guicciardini, *Storia d'Italia*; Roscoe, *Life and Pontificate of Leo X.*; the same in Italian, translated by Bossi, with numerous and valuable notes and additions. For the bulls and speeches of Pope Leo X. see Fabricius, '*Bibliotheca Latina Medicæ et Infirmæ Ætatis*.')

LEO XI., CARDINAL ALESSANDRO DE' MEDICI, had been sent by his predecessor, Clement VIII., legate to France, to receive Henri IV. into the bosom of the Roman Catholic Church. He was very old when elected, on the 1st of April 1605, and he died on the 27th of the same month, it is said from the fatigue attending the ceremony of taking possession of the Patriarchal church of St. John in Laterano.

LEO XII., CARDINAL ANNIBALE DELLA GENGA, born in 1760, of a noble family of the Romagna, was employed as nuncio to Germany and France, by Pius VII., who made him a cardinal in 1816. On the death of Pius VII. he was elected pope, in September 1823. He was well acquainted with diplomacy and foreign politics, and in the exercise of his authority, and in asserting the claims of his see he assumed a more imperious tone than his meek and benevolent predecessor. He re-established the right of asylum for criminals in the churches, and enforced the strict observance of meagre days. He was a declared enemy of the Carbonari and other secret societies. He proclaimed a jubilee for the year 1825; and in his circular letter accompanying the bull, addressed to the patriarchs, primates, archbishops, and bishops, he made a violent attack on the Bible Societies, as acting in opposition to the decree of the Council of Trent, session iv., concerning the publication and use of the Sacred Books. Leo also entered into negotiations with the new states of South America, for the sake of filling up the vacant sees. He gave a new organisation to the university of the Sapienza at Rome, which consists of five colleges or faculties, namely, theology, law, medicine, philosophy, and philology; and he increased the number of the professors, and raised their emoluments. He published in October 1824, a *Moto Proprio*, or decree, reforming the administration of the Papal State, and also the administration of justice, or *Procedura Civile*, and he fixed the fees to be paid by the litigant parties. He corrected several abuses, and studied to maintain order and a good police in his territories. He died in February 1829, and was succeeded by Pius VIII.

LEO ALLATIUS. [ALLATIUS.]

LEO, JOHN, was a Moor of Granada, who, retiring into Africa, when his native place was taken in 1492, received the surname of *AFRICANUS*. After travelling a considerable time in Europe, Asia, and Africa, he was taken at sea by pirates, and subsequently abjured the Mohammedan religion under Pope Leo X. He is believed to have died about 1526. His '*Description of Africa*' was first written in Arabic, and afterwards translated by its author into Italian. It was translated into Latin by John Florian, 8vo, Antw., 1556; 24mo, Lugd. Bat., Elzev., 1632; and into French by Jean Temporal, 2 tom. fol., Lyon, 1556. Marmol the Spaniard appropriated to himself the greater part of the text of this work without acknowledging it. Leo Africanus wrote also the '*Lives of the Arabian Philosophers*,' printed by Hottinger, in Latin, at Zürich, fol., 1664; they were again published, from a different manuscript, in the 13th volume of Fabricius's '*Bibliotheca*.'

LEO, LEONARDO, a celebrated composer, who flourished during the early half of the last century, was born at Naples in 1694, and received his musical education under Alessandro Scarlatti, having for his fellow-disciples Durante, Vinci, Porpora, &c. He soon dis-

tinguished himself by his Italian operas, which gained for him a high reputation, and are mentioned by musical critics in strong terms of praise. But out of the many operas produced by Leo not one survives; and had he not dedicated a portion of his time to the church, his name would now have been utterly forgotten. His '*Dixit Dominus*,' his '*Miserere*,' masses, and other sacred music, will always be esteemed for the grandeur of their style, their deep feeling, the sensible manner in which the words are set, and for greatness of effect produced by comparatively simple means. He will be remembered too in musical history as the master of Piccini, Jomelli, and other able composers. He died at Naples in 1755.

LEONARDO OF PISA, or LEONARDO BONACCI, an Italian mathematician who lived at the commencement of the 13th century, was the first person who brought to Europe the knowledge of Algebra. His work was never printed, but is preserved at Rome, and is described in Cossali's '*History of Algebra*.' From Italy the knowledge of Algebra was long afterwards communicated to the rest of Europe. He was author of a treatise preserved in the Magliabecchi Library at Florence, entitled '*Practica Geographica*.'

LEONIDAS, King of Sparta, commanded the Grecian troops sent to maintain the pass of Thermopylæ against the invading army of the Persians under Xerxes, B.C. 480. The force under his command amounted to 4200 men, besides the Opuntian Locri and 1000 Phocians. With these, during two days' fight, he defended the narrow defile which was the usual passage from Thessaly to the southern parts of Greece; and probably he would have frustrated the utmost efforts of the invader but for the discovery, by some renegades, of a circuitous and unfrequented pass by which a body of the invaders crossed Mount Æta. On receiving intelligence that his position was thus turned, Leonidas dismissed all his soldiers except 300 Spartans; the Thebans, whose fidelity to the common cause was suspected; and the Thespians, 700 in number, who resolved to share the fate and the glory of the Spartans,—for the laws of Sparta forbade her citizens to turn their backs upon any odds; and in this great emergency, when many states seemed inclined to yield to Persia, Leonidas probably thought that the effect to be produced by a great example of self-devotion and obedience was of more importance to the cause of Greece than the preservation of a certain number of her best soldiers. Being surrounded and attacked in front and rear, the Spartans and Thespians fell to a man after making vast slaughter: the Thebans asked and received quarter. The corpse of Leonidas was mutilated and exposed on a cross by Xerxes. A stone lion was afterwards raised near the spot where he fell. The slain were buried where they fell, and their memory was honoured by monumental pillars. Two of the inscriptions ran thus:—"Here 4000 men from Peloponnesus once fought three millions." "Stranger, tell the Lacedæmonians that we lie here, obeying their laws." This self-devotion of Leonidas, the beginning of the grandest war related in history, has ever been held to be among the noblest recorded instances of heroism and patriotism.

We have followed the account of Herodotus (vii., 202, &c.). Diodorus and Plutarch relate it somewhat differently.

LEOPOLD I., emperor of Germany, of the house of Austria, son of Ferdinand III. and of Mary Anne of Spain, was born in 1640; proclaimed king of Hungary in 1655; king of Bohemia in 1657; and, lastly, was chosen emperor in 1659, after a contested election between him and Louis XIV. of France, who had gained four of the electors over to his side. The long reign of Leopold, which lasted nearly half a century, was an eventful time for Germany and Europe, not through any striking qualities of the emperor, but in consequence of the many important wars in which he was concerned. On assuming the government of the hereditary states of the house of Austria in 1657, he found himself at war with the Turks, who were overrunning Hungary and had entered Moravia. His able general Montecuccoli, an Italian by birth, defeated them completely at the battle of St. Gotthard, near Neuhausel, after which a truce was concluded. Many of the Hungarian nobles however, rather than remain the subjects of a foreign power, preferred joining the Turks. The Roman Catholic intolerance of the Austrian court of that age contributed to irritate the Hungarians, among whom were many Protestants and other seceders from the Church of Rome. Their plot was discovered before it was quite ripe, and the leaders, Counts Sdrini, Nadasti, Frangipani, and Tekeli, were convicted and beheaded. The malcontents now broke out into open insurrection, and chose for their leader Emeric Tekeli (son of him of the same name who had been executed). In 1682 Tekeli was acknowledged by the Porte as prince of Hungary tributary to the sultan, whose grand vizier Kara Mustapha entered the field with 150,000 men. Tekeli had with him between 30,000 and 40,000 Hungarians. The combined forces, having defeated the Imperial troops near Raab, advanced to Vienna. It was afterwards ascertained that Louis XIV. was one of the secret movers of this Turkish invasion, as his predecessor Francis I. had excited Solymán to a similar expedition against the capital of Austria. Meantime Louis's diplomatic agent at Craoow had hatched a plot with several disaffected Polish nobles to dethrone Sobieski, who had engaged to assist Leopold. A letter of the French ambassador to his master, being intercepted, discovered to Sobieski the whole plot. With his usual decision and magnanimity of character he repaired to the Diet, read the correspondence, which implicated not a few who were present, expressing at the same time

his conviction, whether real or politically assumed, that the whole was a gross fabrication. "But," added he, "let us convince the world also that it is an imposture; let us declare war against the infidels." The declaration was voted almost unanimously, and Sobieski assembled his troops at Cracow. Meantime Vienna was invested by the Turks on the 15th of July 1683, after Leopold and his court had left it. Messenger after messenger was now despatched to Sobieski to urge him to march. He had some difficulty, owing to the wretched state of the Polish treasury, to collect even 16,000 men, with whom he marched towards the Danube, and was joined by the Duke of Lorraine with the Imperial forces, forming in all 70,000 men. On the 11th of September the allied army reached the summit of the Calemberg, which commanded a view of the Austrian capital, and of the wide-spreading tents of the Ottomans, who were entrenched around it. On the 12th the battle was fought, the Turks were defeated, and Vienna was saved. Hungary was cleared of the Turks after several hard-fought campaigns.

The court of Vienna now took strong measures to prevent any recurrence of Hungarian insurrection supported by Turkish invasion. At the Diet of Presburg of 1687 the crown of Hungary was declared to be no longer elective, but hereditary in the Austrian male line. Transylvania likewise submitted to Leopold unconditionally. The Turkish war was at length concluded by a great victory gained by Prince Eugene, in September 1697, near Zenta in Hungary, which was followed by the peace of Carlowitz.

Leopold sustained three wars against Louis XIV. The first war ended by the treaty of Nymwegen, in 1679, and the second by the peace of Ryswick, in 1697. It was in this second war that the French minister Louvois ordered the French commanders, in the name of his sovereign, to waste the Palatinate by fire and sword. The atrocities committed at Mannheim, Speyer, Oppenheim, and especially at Heidelberg, which was taken and destroyed twice, in 1688 and 1693, are frightful. The same system was pursued at the same time, in 1690-91, in Piedmont, the sovereign of which was allied to the emperor. Catinat, who commanded the French on the banks of the Po, had instructions from Louvois to destroy everything. After some devastation Catinat, who was not a cruel man, asked for fresh instructions, and represented the deplorable state of the innocent populations. "Burn and destroy, and burn again," was the answer of Louvois. (Botta, 'Storia d'Italia,' book xxxii.)

The third war of Leopold against Louis XIV. was that of the Spanish succession, to which his son the archduke Charles had undoubted claims. Leopold however did not live to see the termination of it; he died in 1705, and one of his last acts was to confer by letters-patent on the Duke of Marlborough the dignity of prince of the empire, for the victory of Blenheim.

The principal internal events in Germany during the reign of Leopold are:—1, The establishment of a ninth electorate in favour of Ernest Augustus, duke of Brunswick Lüneburg, who in 1692 became the first elector of Hanover. This was the act of Leopold, who procured the consent of the other electors to it, in return for important aid in money and troops from two princes of that family. 2, The assumption of the regal title by Frederic, elector of Brandenburg and duke of Prussia, in 1701. Leopold acknowledged him, as he stood in need of his assistance, and Holland, England, and Sweden followed the example. France, Spain, and the Pope refused to acknowledge the new King of Prussia for some time longer. 3, The establishment of a permanent Diet attended, not by the electors in person, but by their representatives. Leopold's disposition was well-meaning, but weak, irresolute, and inclined to bigotry. He had the good fortune to meet with, and perhaps the merit of finding out and appreciating, able ministers and generals, whilst his very want of shining talent and the fear excited by the unprincipled ambition of his antagonist Louis XIV. procured him allies in various quarters of Europe. He was succeeded by his eldest son. [JOSEPH I.]

LEOPOLD II. of Germany and I. of Tuscany, was the second son of Maria Theresa of Austria and her husband Francis of Lorraine. After Maria Theresa succeeded, by the death of her father Charles VI., to the Austrian dominions, the grand-duchy of Tuscany, which, according to treaties, was to remain separate from the hereditary states of Austria, devolved upon Leopold, his elder brother Joseph being the presumptive heir of the Austrian dominions. As soon as Leopold was of age he took possession of Tuscany, in 1765, and fixed his residence at Florence. During the five and twenty years of his administration he greatly improved the condition of Tuscany. His principal reforms concerned the administration of justice and the discipline of the clergy in his dominions. By his 'Motu proprio,' in 1786, he promulgated a new criminal code, abolished torture and the pain of death, and established penitentiaries to reclaim offenders. He finally abolished the Inquisition in Tuscany in July 1782, and placed the monks and nuns of his dominions under the jurisdiction of the respective bishops. The discovery of licentious practices carried on in certain nunneries in the towns of Pistoia and Prato with the connivance of their monkish directors induced Leopold to investigate and reform the whole system of monastic discipline, and he entrusted Ricci, bishop of Pistoia, with full power for that purpose. This occasioned a long and angry controversy with the court of Rome, which pretended to have the sole cognisance of matters affecting individuals of the clergy and monastic

orders. Leopold however carried his point, and the pope consented that the bishops of Tuscany should have the jurisdiction over the convents of their respective dioceses. Ricci, who had high notions of religious purity, and was by his enemies accused of Jansenism, attempted other reforms; he endeavoured to enlighten the people as to the proper limits of image-worship and the invocation of saints, he suppressed certain relics which gave occasion to superstitious practices, he encouraged the spreading of religious works and especially of the Gospel among his flock, and lastly he assembled a diocesan council at Pistoia in September 1786, in which he maintained the spiritual independence of the bishops. He advocated the use of the liturgy in the oral language of the country, he exposed the abuse of indulgences, approved of the four articles of the Gallican council of 1682, and lastly appealed to a national council as a legitimate and canonical means for terminating controversies. Several of Ricci's propositions were condemned by the pope in a bull as scandalous, rash, and injurious to the Holy See. Leopold supported Ricci, but he could not prevent his being annoyed in many ways and at last obliged to resign his charge. The whole of this curious controversy is given in Potter's work, 'Vie de Scipion de Ricci,' 3 vols., Brussels, 1825, in which the numerous annexed documents and quotations from other works form the most important part. Leopold himself convoked a council at Florence, of the bishops of Tuscany, in 1787, and proposed to them 57 articles concerning the reform of ecclesiastical discipline. He enforced residence of incumbents, and forbade pluralities, suppressed many convents and distributed their revenues among the poor benefices, wherein he favoured the parochial clergy, and extended their jurisdiction, as he had supported and extended the jurisdiction of the bishops. He forbade the publication of the bulls and censures of Rome without the approbation of the government; he forbade the ecclesiastical courts from interfering with laymen in temporal matters, and restrained their jurisdiction to spiritual affairs only; and he subjected clergymen to the jurisdiction of the ordinary courts in all criminal cases. All these were considered in that age as very bold innovations for a Roman Catholic prince to undertake, and contrast remarkably with recent proceedings of the present Emperor of Austria.

In the civil administration Leopold favoured the independence and self-administration of the communes, suppressed feudal rights, restrained the power of creating fidei-commissa, abolished the right of common pasture, by which many proprietors were prevented from inclosing their lands, equalised the land tax, abolished the monopolies of tobacco, brandy, and other articles, and in all respects favoured liberty of commerce. Meantime he drained the Val di Chiana and part of the Maremme, and fixed colonists in the reclaimed grounds, founded schools and houses for the poor, reformed the universities of Pisa and Siena, opened roads and canals, redeemed great part of the public debt, and lastly ordered the publication of the national budget.

By the death of his brother Joseph II. on the 20th of February 1790, Leopold succeeded to his vast dominions as well as to the imperial crown, whilst his son Ferdinand succeeded him as grand duke of Tuscany. On assuming the administration of the hereditary dominions of the House of Austria, Leopold found discontent everywhere, owing in a great measure to the rash innovations of his brother; the Netherlands in open revolt; Hungary preparing to follow the example; Bohemia disaffected; the clergy and the court of Rome at variance with the government; Prussia hostile; England estranged; France herself convulsed, and likely to become an enemy; and Russia, the only ally of his predecessor, engaged as well as himself in war against the Turks. Leopold had not only abilities but judgment and honest feelings also. He showed an earnest desire to please his subjects, and he succeeded. He abolished the more obnoxious innovations of his brother; he concluded a peace with the Porte; he pacified Hungary by restoring such of the ancient privileges of its aristocracy as had been lately disregarded, and at the same time marching troops to restrain the more rebellious nobles. The next step of Leopold was to endeavour to pacify the revolted states of the Netherlands, by offering to re-establish their ancient constitutions. The insurgents having obstinately refused to listen to his offers, he sent troops against them, and the leaders being divided among themselves, Leopold recovered without much difficulty those fine provinces. Then came fresh anxieties concerning the fate of his sister Antoinette and her husband, the convention of Reichenbach, and that of Pilitz in August 1791, between Austria and Prussia for the purpose of checking the progress of French revolutionary proselytism. In the midst of all these cares Leopold died on the 1st of March 1792, aged forty-four years. He was generally regretted for his affability, his strict justice, his kindness towards the poor, whom he admitted freely into his presence, and his sound judgment. He was succeeded by his eldest son. [FRANCIS II.]

*LEOPOLD GEORGE CHRISTIAN FREDERICK, KING OF THE BELGIANS, Duke of Saxony, Prince of Saxe Coburg Gotha, Margrave of Meissen, and Landgrave of Thuringen, is the third and youngest son of Francis Anthony Frederick, late reigning duke of Saxe Saalfeld Coburg. His Majesty is consequently brother of the Duchess of Kent, uncle to her Majesty Queen Victoria, and to her consort Prince Albert. He was born on the 16th of December 1790, and while holding the title of Prince Leopold of Saxe Cobourg he married (May 2nd, 1816) the Princess Charlotte Augusta, only child

of his late Majesty King George IV., at that time prince regent; but was left a widower on the 6th of November in the following year. An allowance of 60,000*l.* a year had been settled jointly on the prince and princess, with a stipulation that, in event of the death of the princess, the annuity of the prince should be reduced to 50,000*l.* As husband of the heiress apparent to the British throne, Prince Leopold obtained general esteem and respect by his domestic conduct, which certainly offered a very worthy example to royalty at that day; and he resided for many years subsequently at Claremont.

It is well known that the existence of Belgium as a separate state dates only from August 1830, when the revolution of Brussels severed the Belgian provinces from the crown of Holland. In the following October a provisional government was appointed, and in December it was announced to the congress in Brussels that the allied powers of Europe had recognised the permanent erection of those provinces into a separate state under the name of Belgium. The throne of Belgium having been offered to and declined by the Duc de Nemours, son of Louis-Philippe, a new election became necessary, and after a few months of anarchy and confusion, during which fierce and formidable riots broke out at Antwerp, Brussels, and Liege, on the 4th of June 1831 the National Congress at Brussels, after a long discussion, elected Prince Leopold king of the Belgians by a majority of 152 votes to 15. In consequence of an unwillingness on the part of the Belgians to comply with the terms of the great powers of Europe with respect to the territories of that state, the prince declined the crown, but was subsequently induced to accept it conditionally on the 26th of the same month. He entered the capital on the 21st of July, and ascended the throne the day following as King of the Belgians. Belgium is a limited constitutional monarchy, and the succession is limited to the direct male line, to the exclusion of females, and in default of a male heir it is lawful for the king to nominate his successor. In opening the Belgian parliament, King Leopold expressed his intention to encourage manufactures and commerce, and the most perfect civil and religious liberty; and this royal promise has been simply redeemed, as is shown by the flourishing condition of the country. In 1832 King Leopold married as his second wife Louise-Marie-Thérèse, princess of Orleans, eldest daughter of Louis-Philippe, king of the French, by whom he has three children, the eldest of whom, Leopold-Louis-Philippe, born April 9, 1835, is prince royal, duke of Brabant, and heir apparent to the Belgian crown.

LEOSTHENES was one of the last successful generals of Athens. He was of the party of Demosthenes; and the violence of his harangues in favour of democracy drew the reproach from Phocion, "Young man, thy words are like the cypress, tall and large, but they bear no fruit." He had however gained reputation enough to be chosen leader by a large body of mercenary soldiers returned from Asia shortly before the death of Alexander, who, on that event being known, were taken openly into the pay of the republic. His first exploit was the defeat of the Boeotians, near Plataea. After this he took post at Pylae, to prevent the entrance of Antipater into Greece, defeated him, and shut him up in Lamia, a town in Thessaly, to which he laid siege; and from that siege the Lamian war has its name. Leosthenes was killed in the course of it, and after his death success deserted the Athenian arms. [ANTIPATER.] He left a high reputation: his picture, painted by Arcesilaus, is mentioned by Pausanias (1, c. 1.) as one of the objects in the Peiræus worthy of notice. (Diod. xviii.)

Another Leosthenes, also an Athenian, was condemned to death, B.C. 361, for being defeated by Alexander of Phœnæ. (Diod. xv. 95.)

LEPIDI, the name of one of the most distinguished families of the patrician gens or clan of ÆMILII. Those most worthy of notice are:—

1. MARCUS ÆMILIUS LEPIDUS, who was sent as ambassador to Ptolemy, king of Egypt, at the close of the Second Punic War, B.C. 201. (Polyb. xvi. 34; Liv., xxxi. 2; compare Tac., 'Ann.' ii. 67.) He obtained the consulship B.C. 187 (Liv., xxxix. 5, 56; Polyb., xxiii. 1), and again in B.C. 175. In B.C. 179 he was elected Pontifex Maximus and Censor (Liv., xl. 42, 45; Gell., xii. 8). He was Princeps Senatus six times. (Liv., 'Epit.' 48.) He died B.C. 150.

2. MARCUS ÆMILIUS LEPIDUS, Prætor B.C. 81; after which he obtained the province of Sicily (Cic., 'Verr.', iii. 91.) In his consulship, B.C. 78, he endeavoured to rescind the measures of Sulla; but was driven out of Italy by his colleague, Quintus Catulus, and by Pompey, and retired to Sardinia, where he died in the following year, while making preparations for a renewal of the war. (Appian, 'Civ.' i. 105; Liv., 'Epit.' 90; Plutarch, 'Pomp.' 16.)

3. MARCUS ÆMILIUS LEPIDUS, the Triumvir, the son of the preceding, was Ædile B.C. 52, and Prætor B.C. 49, in which year Cæsar came to an open rupture with the senatorian party. [CÆSAR; ANTONIUS.] Lepidus from his first entrance into public life opposed the senatorian party; and though he does not appear to have possessed any of the talent and energy of character by which Antony was distinguished, yet his great riches and extensive family connections made him an important accession to the popular cause. On the first expedition of Cæsar into Spain, Lepidus was left in charge of the city, though the military command of Italy was intrusted to Antony. During Cæsar's absence, Lepidus proposed the law by which Cæsar was created Dictator.

In the following year, B.C. 48, he obtained the province of Hispania

Citerior, with the title of proconsul; and in B.C. 46 was made consul with Cæsar, and at the same time his master of the horse—an appointment which again gave him the chief power in Rome during the absence of the dictator in the African war. In B.C. 44 he was again made master of the horse, and appointed to the provinces of Gallia Narbonensis and Hispania Citerior; but he did not immediately leave Rome, and was probably in the senate-house when Cæsar was assassinated. After the death of Cæsar, Lepidus was courted by both parties; and the Senate, at the motion of Cicero, decreed that an equestrian statue should be erected to his honour in any part of the city he might fix upon. Lepidus promised to assist the Senate, but at the same time carried on a secret negotiation with Antony. On his arrival in his province, being ordered by the Senate to join Decimus Brutus, he at length found it necessary to throw off the mask; and instead of obeying their commands, united his forces with those of Antony.

In the autumn of this year, B.C. 43, the celebrated triumvirate was established between Antony, Lepidus, and Octavianus (Augustus); and in the division of the provinces, Lepidus received the whole of Spain and Gallia Narbonensis. The conduct of the war against Brutus and Cassius was assigned to Antony and Augustus, while the charge of the city was intrusted to Lepidus, who was again elected consul (B.C. 43). After the defeat of Brutus and Cassius, Antony and Augustus found themselves sufficiently powerful to set contrary to the advice and wishes of Lepidus; and in the new division of the provinces, which was made after the battle of Philippi, Spain and Gallia Narbonensis were taken from Lepidus, and Africa given to him instead. Lepidus had now lost all real authority in the management of public affairs, but he was again included in the triumvirate when it was renewed B.C. 37. In the following year he was summoned from Africa to assist Augustus in Sicily against Sextus Pompeius; and he landed with a large army, by means of which he endeavoured to regain his lost power, and make himself independent of Augustus: but in this attempt he completely failed. Being deserted by his own troops, he was obliged to implore the mercy of Augustus, who spared his life, and allowed him to retain his private property and the dignity of Pontifex Maximus, which he had obtained on the death of Julius Cæsar, but deprived him of his province and triumvirate, and banished him, according to Suetonius, to Circeii ('Octav.' c. 16).

After the battle of Actium, his son formed a conspiracy for the assassination of Augustus on his return from the East, which was discovered by Mecenas; and Lepidus, having incurred the suspicion of his former colleague, repaired to Rome, where he was treated, according to Dion Cassius (div. pp. 607, 608, Stephan.) with studied insult and contempt. He died B.C. 12.

* LEPSIUS, CARL RICHARD, the son of Carl Peter, a distinguished writer on mediæval architecture, was born at Naumberg-on-the-Saal, in Prussian Saxony, on December 24th, 1811. He received his first instruction from his father, and in the public school at Naumberg. In 1828 he proceeded to the University of Leipzig, where he commenced the study of philology, which he continued at the universities of Göttingen and Berlin, at the last-named place having the advantage of being under Bopp. In 1833 the degree of Doctor was conferred on him by the University of Berlin for his essay 'De tabulis Eugubinis;' and in 1834 appeared his 'Paliographie als Mittel der Sprachforschung.' In order to extend his linguistic and archæological knowledge he travelled to France, where the recommendation of Alexander von Humboldt secured him a friendly reception from the French literati. From hence in 1835 he proceeded to Italy, passing the winter in Turin and Pisa, and in April 1846 he arrived at Rome, where he met with Bunsen, then ambassador from Prussia to the Pope, with whom he formed an intimate friendship. At Rome he became a member of the Archæological Institute. He now more particularly directed his attention to the antiquities of Egypt, and in 1837 his 'Lettre à M. Rosellini sur l'alphabet hiéroglyphique,' excited considerable attention; as did also several of his essays printed in the 'Transactions' of the Archæological Institute upon some Egyptian monuments of art; and still more another, printed at Leipzig in 1842, on 'Das Todtenbuch der Ægypter' ('Obituary of the Egyptians'), from a hieroglyphic on papyrus at Turin. During these investigations he also found time to prepare two essays for the French Institute; one on the relationship between the Semitic, Indian, Æthiopian, and other tongues; the second on the origin of the numerals in the Indo-Germanic languages, for which he received a prize of 1200 francs. His residence in Italy also enabled him to investigate the Etrurian and Oceanic dialects, of which he published at Leipzig some fragments, 'Inscriptiones Umbricæ et Oscæ,' with an explanatory commentary in 1841; followed in 1842 by two essays on the 'Tyrrenian Pelægi in Etruria,' and on the 'Dissemination of the Italian Monetary System from Etruria.' But though these works all pertain to his comparatively short residence in Italy, he had left it in 1838 on a mission to England from the Archæological Institute of Rome. Here in London he again met with Bunsen, and with him projected a great historical and antiquarian work on Egypt, but which was to depend upon a journey to that country, which he then contemplated. Bunsen warmly supported the plan, but instead

of his travelling alone, when a few years later he had returned to Berlin, Bunsen, with the assistance of Humboldt, Eichhorn, and others, induced Frederick-William IV. of Prussia to place him at the head of a large party of learned men to investigate thoroughly the antiquities and state of Egypt; and before his departure he was created professor extraordinary of the University of Berlin. In the autumn of 1842 the party was assembled at Alexandria: it consisted of Lepsius, draughtsmen to copy the hieroglyphics, architects, painters, &c., in all ten persons, exclusive of attendants. It received the protection of the Egyptian government, and everything progressed favourably. Among the results was the discovery of some of the monuments of the dynasty of the Pharaohs; and above the second cataract near Gizeh and Sakara the excavations of fifty of the graves of the Ethiopian dynasty of Egypt, identifying them with the 18th dynasty of Manetho. Lepsius also believes he discovered in the ruins of Howara the remains of the celebrated Labyrinth, and the Lake Mœris in the upper part of Faium. He also thinks he has proved that Ethiopia derived its civilisation from Egypt, and from an authentic Ethiopic inscription at Philœ that the pure Ethiopians of Meroe were not a black but a brown Caucasian race, whose domination at a later period tended towards the east, and who during the middle ages held dominion on both sides of the Red Sea under the name of Bedja. Lepsius also succeeded by means of fresh excavations of the Memnonium at Thebes, in obtaining a complete ground-plan of this famous temple. He also discovered the tomb of Ramœe-Sesostris in Babel-Meluk, and measured and delineated the principal temple anew with greater exactness than had hitherto been done. The expedition returned in the early part of 1846, having brought or transmitted the greater part of the valuable and curious objects of Egyptian art which are now in the new museum at Berlin. While in Egypt he wrote 'Briefe aus Ägypten, Äthiopien, und der Halbinsel des Sinai,' which were published at Berlin, and contain lively narratives of his proceedings and discoveries. In 1846 he issued a short account of his journey from Thebes to the peninsula of Sinai, which he had made in 1845, from March 4th to April 14th. In 1849 appeared 'Die Chronologie der Ägypter,' vol. i. In the meantime he had been labouring on his great work, 'The Monuments of Egypt and Ethiopia' ('Der Denkmälern aus Ägypten und Äthiopien,' &c.), magnificently printed in elephant folio, at the expense of the King of Prussia. It was commenced in 1849, and was published in parts, of which 75 have been published (Dec. 1856), and the whole is expected to be completed in about 100 parts. In 1851 he printed his essay 'Ueber den ersten Ägyptischen, Götterkreis, und seine geschichtliche-mythologische Entstehung;' in 1853 another, 'Ueber die 12te Ägyptische Königs-Dynastie;' in 1853 also a work, 'Ueber einige Ergebnisse für die Kenntniss der Ptolemäergeschichte;' and in 1855 another, 'Ueber eine Hieroglyphische Inschrift am Tempel von Edfu,' all in 4to, with plates. The Letters from Egypt have been translated into English.

LERMONTOV, MIKHAIL IVANOVICH, a Russian poet and novelist was born in 1811, of a noble family, was educated at home and at the school of the Pages, entered the military service, and became an officer of the guards. In 1837, when Pushkin, the Russian Byron, fell in a duel with a Frenchman, Lermontov wrote a poem 'On the Death of Pushkin,' which excited in so strong a degree the wrath of the Emperor Nicholas, that he struck the author off the list of officers of the guard, and sent him to serve in the army of the Caucasus. The poem, which long circulated in manuscript in Russian society, was printed for the first time in 1856, in the second number of the 'Polar Star,' a Russian periodical published at London by Herten, who had been Lermontov's personal friend. It insinuates that the insidious favour of the court, which it reproaches for its persecution of Pushkin when his soul was free, had placed on the noble forehead of the poet a "crown of thorns," and that Pushkin died with a deep thirst for revenge mingled with a secret sorrow for hopes deceived. Lermontov wrote, in the midst of the hardships and perils of the Caucasus, a novel entitled 'Geroy nashego vremeni' ('A Hero of our Times'), which was published at St. Petersburg in 1840, and at once attained a high popularity, which it appears still to retain. The hero, Pechorin, an officer in the army of the Caucasus, is a misanthropic mischief-maker disgusted with life, who, finding that his friend is in love with a lady, wins her affections to tell her that he rejects them, and shoots her lover in a duel under frightful circumstances, which are described at length. The character of Pechorin was said to be intended by the author for himself, and this was faintly denied in much the same manner that Byron at times denied his own identity with Childe Harold. Apart from its repulsive plot the novel has many merits, in particular some easy and vivid sketches of the mountain scenery of the Caucasus. It has been rendered into several languages, and two English translations appeared in the same year, 1854, one by Madame Theresa Pulzky. The poems of Lermontov are also rich in descriptions of Caucasian scenery, from which he appeared to receive a feeling of vivid pleasure, his favourite amusement being a solitary ride over the steppes. His fame had scarcely begun to spread when news was received of his death. The duel of 1837 had first darkened his career; the most striking incident in his novel was a duel in the Caucasus; and he fell in a duel in the Caucasus in 1841, before he was thirty. His poems were collected soon after his death at St. Petersburg, and a third edition of his whole works appeared

there in 1852. A complete translation of his poems into German by Bodenstedt was published at Berlin in the same year. After Pushkin Lermontov is considered the most distinguished Russian poet of the Byronic school, to which he belonged in every point of view.

LEROI, JULIEN DAVID, born in 1724, was the son of an eminent watchmaker at Paris. Having made choice of architecture as a profession, he applied himself to the study of it in a very different manner from the plodding routine then established; and being anxious to become acquainted with the art in the remains of antiquity, then very little known, after passing some years at Rome, he visited Greece in 1754. On his return he gave the world the fruits of his researches in his 'Ruines des plus beaux Monumens de la Grèce.' Although not free from numerous errors, which were subsequently exposed by Stuart, and which the author corrected in his second edition (1770), this work had the merit of being the first publication of the kind—the first attempt to show what Grecian architecture actually was. Undoubtedly its value has since been greatly diminished by the more accurate labours of Stuart and others, but its appearance forms an epoch in the chronology of the art. It certainly contributed much to correct the vitiated taste that had long been in vogue in France, and to open new views in regard to architecture, which meritorious aim was assiduously followed up by its author in the excellent lessons he delivered during forty years as professor. His whole life was devoted to his own studies, and the instruction of others; and such were his zeal and disinterestedness, that he cheerfully continued his services as professor gratuitously in the latter part of his life, though the troubles of the revolution had greatly impaired his fortune, and though the infirmities of age were increasing upon him. He died at Paris, universally regretted, in January 1803, aged seventy-five. Besides the one above mentioned, Leroi published several other works, among which are, 'Histoire de la Disposition, &c., des Temples des Chrétiens,' 8vo, 1764; 'Observations sur les Edifices des Anciens Peuples,' 8vo, 1767; and 'De la Marine des Anciens Peuples,' 8vo, 1777.

LESBONAX, a Greek rhetorician and philosopher, was a native of Mitylene. He lived in the time of Augustus, and was the father of Potamon, who taught eloquence at Rome under the reign of Tiberius, and was highly favoured by that emperor. (Suidas.)

Suidas informs us that Lesbonax wrote many philosophical works; but none of them are extant. Photius says ('Cod.' 64) that he had read sixteen orations of Lesbonax, of which however only two have come down to us, one exhorting the Athenians to continue the war against the Lacedæmonians, and the other advising them to attack the Thebans. Some critics have placed the author of these orations in the time of the Peloponnesian war; but a mere perusal of the speeches will show that they must have been written at a much later period. We know moreover from the writings of Libanius, Seneca, Quintilian, &c., that it was very common for rhetoricians to declaim upon subjects chosen from ancient history. These orations were first published by Aldus (Ven., 1618), and afterwards by Stephens, with the Orations of Æschines, Lysias, and others (Paris, 1675); by Gruter (Han., 1619), and also by Reiske, in the eighth volume of the 'Oratores Græci;' by Bekker, and by Dobson. Orall published separate editions of them, Leipz., 1820.

There was also a grammarian of the name of Lesbonax, who probably lived at a later period, who wrote a work entitled *Περὶ Σχημάτων*, 'concerning grammatical figures,' &c., which was first published by Valckenær in his edition of Ammonius, pp. 177-188.

LESCOT, PIERRE, a French architect of the 16th century, of whom however nothing is distinctly known, but he is generally supposed to have designed and commenced together with Jean Goujon, the present palace of the Louvre for Francis I. and Henri II.: the exact time is a matter of uncertainty. Lescot was born, according to some accounts, about 1510, and he lived to the age of sixty; other accounts give the dates 1518 and 1578 as the years of his birth and death. He erected the southern and western sides of the quadrangle, but all that now remains by Lescot is the western side, facing the Tuileries, known as the Vieux Louvre; it contains the ancient Salle des Gardes, or Salle des Cent-Suisses, with the caryatides of Goujon, whence its modern name of Salle des Caryatides.

Lescot's style and services to architecture have been the subjects of various speculations, but they are all extremely vague, and amount to very little. By some he is supposed to have been the first to abandon the old irregular gothic, and to have introduced the Italian style into France; but this was done by Italian artists themselves, several of whom were employed by Francis I. long before Lescot could have attained anything like mastery in his art, or even maturity of years. Fontainebleau is an instance, in which Serlio, Primaticcio, and others were employed by Francis I.

Lescot is said also to have designed the Fontaine des Innocents, attributed by some to Goujon, the sculptor of the nymphs upon it. Lescot was Abbé of Cluny or Clugny, and a canon of Notre-Dame.

LESLIE, CHARLES, a person much engaged in the political and theological controversies of the age in which he lived, was the son of an Irish prelate, and was born in Ireland about 1650, and educated at Trinity College, Dublin. His course in life was very eccentric. In 1671 he came to England, and entered himself of an inn of court with a view to the study of the law. In a few years however he turned himself to divinity, was admitted into orders, and, settling in Ireland,

became chancellor of Cloyne. He was living in Ireland at the time of the revolution, and distinguished himself in some disputations with the Roman Catholics on the side of the Protestant Church.

Though a zealous Protestant, he scrupled to renounce his allegiance to King James, and to acknowledge King William as his rightful sovereign. There was thus an end to his prospects in the Church, and leaving Ireland he came to England, and there employed himself in writing many of his controversial works. When James II. was dead, Leslie transferred his allegiance to his son, the Pretender; and as he made frequent visits to the courts of the exiled prince, he so far fell under suspicion at home that he thought proper to leave England, and join himself openly to the court of the Pretender, then at Bar-le-Duc. He was still a zealous Protestant, and had in that court a private chapel, in which he was accustomed to officiate as a minister of the Protestant Church of England. When the Pretender removed to Italy, Leslie accompanied him; but becoming at length sensible to the strangeness of his position, a Protestant clergyman in the court of a zealous Roman Catholic, and age coming on, and with it the natural desire of dying in the land which had given him birth, he sought and obtained from the government of King George I. permission to return. This was in 1721. He settled at Glaslough, in the county of Monaghan, and there died in 1722.

Leslie's writings in the political controversies of the time were all in support of high monarchical principles. His theological writings were controversial; they are too many to be particularised in the brief space which we can allot to him, but they have been distributed into the six following classes: those against, 1, the Quakers; 2, the Presbyterians; 3, the Deists; 4, the Jews; 5, the Socinians; and, 6, the Papists. Some of them, especially the book entitled 'A Short and Easy Method with the Deists,' are still read and held in esteem. Towards the close of his life he collected his theological writings, and published them in two folio volumes, 1721.

* LESLIE, CHARLES ROBERT, R.A. As this eminent painter is sometimes called an American and sometimes an Englishman, and as English and American writers appear to view the matter differently, while we see it stated in an American work of some authority that Mr. Leslie "has always considered himself as an American citizen" it may be as well to state his origin and place of birth distinctly, and leave the reader to draw his own conclusion. The Leslies belonged originally to Scotland, and from that country an ancestor of Mr. Leslie emigrated shortly after 1745, and settled in Maryland, and his children likewise established themselves in America. Mr. Leslie's father commenced business early in life in Philadelphia, and is said to have been a man of considerable attainments and ingenuity, and a friend of Benjamin Franklin and other eminent Americans. Mr. Leslie, who had married an American lady, and had already had one or two children, removed in 1792 to London; and there, in October 1794, his son Charles Robert, the subject of the present notice, was born. In 1800 Mr. Leslie, sen., returned with his family to Philadelphia. Young Leslie, after receiving the usual school education, was apprenticed to a bookseller, but eventually succeeded in obtaining his release from that uncongenial occupation, and permission to follow his own inclination and become an artist.

He accordingly proceeded in 1813 to London, bearing introductions to the two painters whom America regarded as specially her own—Benjamin West, then president of the Royal Academy, and Washington Allston, then in the plenitude of his European celebrity. By these eminent artists the young man was received with great kindness, and from both of them he continued to receive judicious advice and assistance in his studies. West smoothed his entrance as a student into the Royal Academy, and in the schools of that institution he laboured with equal diligence and success. At the commencement of his career as a painter Mr. Leslie essayed historical pictures on a large scale, but he soon found that his strength lay in more homely subjects and a smaller canvass, and he at once struck on the right path and steadily pursued it. The first work, we believe, which obtained notice, was his 'Anne Page and Master Slender,' which was exhibited at the British Institution in the spring of 1820. This was followed by 'Roger de Coverley going to Church,' which appeared at the Royal Academy exhibition in May of the same year, and met with decided and well-deserved success. 'May-Day in the Reign of Queen Elizabeth' amply sustained the reputation which the previous pictures had obtained; all these were engraved, and the artist was elected (1821) an Associate of the Royal Academy. We cannot follow closely his subsequent career. The events of his life would be chiefly the completion and exhibition of his pictures; and of these it will suffice to say that no English painter probably could be named whose course has been marked by more conscientious devotion to his art, or more steady improvement in it. Every work has been carefully elaborated both in the preliminary study and in the execution, and while every one carries with it evidence of original power and shrewd observation, it exhibits also the most anxious endeavour to secure excellence by patient labour. Mr. Leslie was elected R.A. in 1826. In 1833 he surprised his friends by accepting the post of drawing-master to the United States Military Academy; but the trial of a very few months sufficed to convince him that he had mistaken his vocation, and he returned to England and to his accustomed labours. On the death of Mr. Howard (October 1847) he was elected professor of painting

at the Royal Academy, an office he held till 1851, when he was compelled by ill-health to resign it.

The paintings of Mr. Leslie have been chiefly illustrations of the great humorous writers, but he has usually chosen a theme suggested rather than described by them, so that his own humour and imagination have found fair scope for their exercise. Shakspeare has furnished him with Slender, Ann Page, and Falstaff, with Katherine and Petruchio, with Sir Toby, Sir Andrew and Beatrice, and to each he has imparted characteristic form, giving as well as borrowing something from the text, and interpreting it with a genial reverence. The Roger de Coverley of Addison has certainly never been better painted than by Leslie, and perhaps never so well. Uncle Toby and Widow Wadman too were depicted by him in a manner that would have delighted Sterne. Pope, Goldsmith, Smollet, and Fielding, have each had their pages really illustrated by Leslie's pencil; and in every case the character has been rendered with admirable tact, grace, and refinement, as well as with real though delicate humour. And whilst so happy in treating English subjects, Mr. Leslie has shown himself no less at home with the one or two older French and Spanish authors who have become thoroughly familiar to the English reader. Perhaps it would not be too much to say, that no pictorial representations of Moliere's inimitable comedies have ever been so thoroughly enjoyed in this country as those of Mr. Leslie: and yet if we were asked what character Mr. Leslie has made most entirely his own, we should have little hesitation in answering the immortal Sancho Panza; and perhaps none of his works have on the whole been so generally popular as his now somewhat extended series from Don Quixote, in most of which Sancho is the chief figure: it may be added as somewhat curious, that though so many of his best pictures have been taken from 'Don Quixote,' he has taken none (or rather we cannot recollect any) from 'Gil Blas.' Besides the pictures of the class just noticed, Mr. Leslie has painted a good many portraits, and some that may be called fancy portraits, of which his 'Mother and Child,' so well-known by the engraving, is an admirable example; and as already stated, several historical and scriptural subjects. He also painted as a commission, 'The Queen receiving the Sacrament after her Coronation,' and a fresco, 'Scene from Comus,' for the summer-house at Buckingham Palace.

Mr. Leslie has added a couple of books to the somewhat scanty library of English art-literature. The first, 'Memoirs of the Life of John Constable, R.A.,' 4to, 1843 (subsequently reprinted in 8vo without the engravings), is chiefly compiled from the letters of Constable, and is a work which affords a good insight into the mental character and artistic views of that remarkable landscape-painter. Mr. Leslie's other work is entitled 'A Handbook for Young Painters,' 12mo, 1855, and consists of a remodelling of the materials supplied by his Lectures delivered to the students of the Royal Academy while professor of painting at that institution; and as the result of the observation, reflection, and experience of a painter of Mr. Leslie's standing and ability cannot be too carefully considered by the young painter, while most old painters even would find its study not unserviceable: there is also in it matter which will be found of use to the student of the history of English art.

The celebrated collection of English pictures formed by Mr. Sheepshanks is especially rich in the works of Mr. Leslie. In the Vernon Gallery there are two paintings by him: his well-known 'Uncle Toby and the Widow' (painted in 1831) and 'Sancho Panza and the Duchess' (1849), a repetition with improvements (as all his repetitions are) of the original Petworth.

* ELIZA LESLIE, the elder sister of the painter, was born in Philadelphia, and is a favourite American writer, though little known on this side the Atlantic. She commenced her literary life by writing a book of 'Household Receipts,' which had an extraordinary sale in the States, and followed it up by a series of children's books, while her latest work we believe has been a 'Behaviour Book'—a work apparently much required in some parts of America. But her more important writings have consisted of 'Pencil Sketches, or Outlines of Character and Manners,' chiefly satirical, which were so popular that a second and subsequently a third series was required; 'Althea Vernon,' a novel, and some volumes of 'Tales and Sketches.'

LESLIE, SIR JOHN, was born on the 16th of April 1766, at Largo, a village on the coast of Fifeshire. When a child he was weak and sickly, which occasioned frequent interruptions in his elementary education. He however evinced at an early age a decided partiality for geometrical exercises, and a proportional dislike to the study of languages, more particularly of the Latin, although in this he subsequently attained considerable proficiency. With the assistance of his elder brother Alexander, he soon made sufficient progress in arithmetic and geometry to attract the attention of the parochial minister, through whose instrumentality he was probably presented to Professors Robison and Stuart, and by their suggestions, in 1779, sent to the University of St. Andrews. Here his abilities introduced him to the patronage of the Earl of Kinnoull, the then chancellor of the university, who proposed to defray the expenses of his education on the condition that his father would consent to his being educated for the church. After prosecuting his studies at this university during six sessions, he removed in 1783-84 in company with James Ivory [IVORY, JAMES] to Edinburgh, where he attended the courses of several of the professors for three years, in which time he was engaged

by Dr. Adam Smith to assist in the education of his nephew Mr. Douglas, afterwards Lord Reston. In 1788 he became tutor to two Americans of the name of Randolph, junior students at the University of Edinburgh, with whom he proceeded to Virginia, and after an absence of about twelve months, during which time he visited New York, Philadelphia, &c., he again returned to Scotland. In the early part of 1790 he set out for London with recommendatory letters from several individuals of literary and scientific reputation; and among others from Dr. Adam Smith, who is said on this occasion to have given him for advice, "never to approach an author whose favour he was solicitous of gaining without first reading his works, lest the conversation should turn that way."

His intention seems to have been to deliver lectures on natural philosophy, but finding, to use his own words, that "rational lectures would not succeed," he determined upon writing for periodical publications as the readiest means of obtaining a subsistence. He accordingly began to furnish articles for the 'Monthly Review,' and about the same time was employed by Dr. William Thomson (whose acquaintance he had originally made at St. Andrews University) to collect and furnish notes for a Bible which was then being published in parts. From the translation of Buffon's 'Natural History of Birds,' which appeared in 1793, in nine volumes 8vo, he derived sufficient pecuniary emolument to lay the foundation of his subsequent independence.

In 1794 he visited Holland, and in 1796 he proceeded through Germany and Switzerland, in company with Mr. Thomas Wedgwood. Upon his return he became candidate for some professorship in the University of St. Andrews, and shortly after for that of natural philosophy at Glasgow, but in both instances was unsuccessful. In 1799 he again set out upon a continental tour, and travelled through Denmark, Norway, and Sweden, with Mr. Robert Gordon.

In 1805 he offered himself as a candidate for the professorship of mathematics in the University of Edinburgh, which had become vacant by the promotion of Professor Playfair to the chair of natural philosophy. At this period the only production of Mr. Leslie relative to the pure mathematics consisted of an 'Essay on the Resolution of Indeterminate Equations,' written about the time of his quitting the university, and printed in the 'Edinburgh Philosophical Transactions' for the year 1788; but he had published several papers on different branches of physics in Nicholson's 'Philosophical Journal,' and the Royal Society of London had recently awarded to him the Rumford medals for his researches on the nature and propagation of heat, an account of which had appeared the preceding year ('Experimental Inquiry into the Nature and Properties of Heat,' 8vo, 1804). In addition to the reputation he had thus acquired, he came forward with the warmest testimonials of Drs. Maskelyne and Hutton, Sir Joseph Banks, Baron Maseres, and other persons of distinction; but the appointment rested in the magistrates and town council of Edinburgh, subject to a clause in the charter of the university, which declares that the electors shall take advice of the clergy in the choice of professors; and these being desirous of promoting the election of Dr. Thomas Macknight—one of their own body, and a gentleman perhaps equally qualified for the situation—they therefore determined upon opposing that of Mr. Leslie. They grounded their objection upon a note in his 'Inquiry into the Nature of Heat' (page 135, and note 16, p. 522), wherein he refers to Hume's 'Theory of Causation,' which he designates "a model of clear and accurate reasoning," whence his clerical opponents somewhat illogically inferred that he had rejected those arguments which are deducible from the observance of nature in proof of the existence and attributes of a Creator. They forthwith made a formal protest against his election, and expressed their determination, in the event of his induction into the office of professor, to prosecute for his immediate ejection. The town council notwithstanding conferred the professorship upon Mr. Leslie, and the clergy accordingly brought the affair before the General Assembly. The debate which ensued (see 'Report of the Debate,' 8vo, Edin., 1805), and which lasted for two days, was marked by strong party spirit on the side of the plaintiffs, and by the powerful and sarcastic arguments of Sir Henry Moncrieff, who conducted the defence. Near midnight on the second day (23rd of May 1805), the case was dismissed as 'vexatious.'

Mr. Leslie entered immediately upon his official duties, which he continued to discharge with zeal and assiduity during the fourteen following years. In 1809, upon the death of Professor Playfair, he was called to the chair of natural philosophy, when his first care was directed to the extension of the apparatus required in the more enlarged series of experiments which he thought necessary for the illustration of the course. "This indeed," says his biographer, Mr. Napier, "was an object of which, from the first to the last hour of his incumbency, he never lost sight; and it is due to him to state that it was through his exertions that the means of experimental illustration, in the natural philosophy class, were first made worthy of the university." He was knighted on the 27th of June 1832, and died on the 3rd of November in the same year, at his seat at Coates in Fifeshire, about two miles from the place of his birth.

It was about the year 1794-95, while occupied upon a long series of hygrometrical experiments, that he either re-invented or borrowed from the 'Collegium Experimentale' of Sturm his Differential

Thermometer. He supposed the propagation of radiant heat to take place by means of aerial pulsations, a supposition which appears irreconcilable with the existence of radiation *in vacuo*, and equally at variance with the more recent experimental results of Messrs. Dulong and Petit. He assumed moreover the universality of what is usually termed Newton's law, namely, "that the decrements of heat of a cooling body are proportional to the difference between its temperature and that of the surrounding medium;" whereas it is known to hold only so long as that difference does not exceed from 40° to 50°. His own theories indeed sometimes appear to be rather the effusions of a bold and active fancy than the logical deductions from any established facts, and, as an almost inevitable consequence, the results to which they lead him appear equally fanciful. Of this character are his conclusions, that "the matter of the moon is phosphorescent, and at some future period our satellite will become dim and seem blotted from the blue vault of heaven;" that "the earth contains a concavity filled with concentrated light, shining with intense refulgence and overpowering splendour," and others of like nature. He regarded the inventive faculty as the highest with which the mind can be endowed, and attached so little importance to inductive philosophy that he has been heard to deny that any merit is due to Bacon as its founder. As an author, he was deficient in systematic arrangement and simplicity of style. As a lecturer, he was liable to fall short of a satisfactory elucidation of his subject by estimating too highly either the capacity or the previous knowledge of his auditors. But on the other hand, his active curiosity, varied reading, and powerful memory, led to the acquisition of very extensive knowledge, which in many instances he successfully applied to the promotion of science, and "his exquisite instruments and experimental devices will ever attest the utility no less than the originality of his labours."

Besides the works noticed in the preceding part of this article, he has left—

'Elements of Geometry, Geometrical Analysis, and Plane Trigonometry,' 8vo, 1809; the same abridged, 1828; 'Geometry of Curve Lines,' 8vo, 1821; 'Philosophy of Arithmetic,' 1817; 'Account of Experiments and Instruments depending on the relations of Air to Heat and Moisture,' 12mo, 1813; 'Elements of Natural Philosophy,' vol. i. (containing Mechanics and Hydrostatics), 8vo, 1823.

In the *Edinburgh Philosophical Transactions*:—'Observations on Electrical Theories,' 1824; 'On certain Impressions of Cold transmitted from the higher Atmospheres, with a Description of an Instrument adapted to measure them,' 1818.

In the *Encyclopædia Britannica*:—Articles 'Achromatic Glasses;' 'Acoustics;' 'Aeronautics;' 'Andes;' 'Angle;' 'Angle, Trisection of;' 'Arithmetic;' 'Atmometer;' 'Barometer;' 'Barometrical Measurements;' 'Climate;' 'Cold and Congelation;' 'Dew;' 'Interpolation;' 'Meteorology;' 'Progress of the Mathematical and Physical Sciences during the Eighteenth Century.'

In the *Edinburgh Review*:—Papers on the 'Memoirs of the Society of Arcueil;' on the 'History of the Barometer;' on 'Delambre's Arithmetic of the Greeks;' on Von Buch's 'Travels;' on Humboldt's 'Physical View of the Equatorial Regions;' and his 'Travels;' on the 'Attempts to discover a North-West Passage.'

In Nicholson's *Philosophical Journal*, vols. iii. and iv.:—'Description of an Hygrometer and Photometer;' 'On the Absorbent Powers of different Earths;' 'Observations on Light and Heat, with Remarks on the Enquiries of Dr. Herschel.'

Some papers by him on physical subjects were also read before the Royal Society of London, but none were ever printed in their 'Transactions.'

(*Memoir of Sir John Leslie*, by Macvey Napier, 1833.)

L'ESPINASSE, MADEMOISELLE, the name of a lady much celebrated in the Parisian literary circles soon after the middle of last century, was born in 1732. She is supposed to have been the illegitimate daughter of people of rank. She was employed to read to and converse with Madame du Defand in her blindness; but being ambitious, well-informed, and eloquent—endowed with much of what the French call l'esprit—she attracted the interest of the circle surrounding Madame du Defand to an extent which greatly displeased that lady. Mademoiselle l'Espinasse was consequently dismissed, but she had the boldness to plan, and the ability to execute, the collection of a brilliant literary circle round herself. In 1764, when D'Alembert fell ill she nursed him with zeal, and thenceforth he resided in her house. Marmontel, who in his 'Mémoires' has given a very full account of this lady, states that she made divers attempts to accomplish a high matrimonial alliance, and in one instance induced the relations of a noble Spaniard on whom she had made an impression to allow him to return to France, by procuring a false medical certificate that it was necessary to his health. Moreslet, the uncle-in-law of Marmontel, however in his 'Mémoires' throws doubt on this story. She died in 1776, to the great grief of D'Alembert, whom she had long mortified by not returning his affection. Three volumes of her love-letters, conspicuous for ardent eloquence, were published in 1809.

LESSING, GOTTHOLD EPHRAIM, was born on the 22nd of January 1729 at Kamentz in Upper Lusatia, of which place his father was pastor. His attachment to reading displayed itself from his earliest childhood, and he was a devourer of books at an age when others are mere school-boys. Of his extraordinary diligence in study

sufficient idea may be formed when it is stated that while at the school at Meissen he perused a number of classic authors besides those which entered into the course there adopted, and further translated the third and fourth books of Euclid, and drew up a history of mathematics. He continued at that seminary till the middle of 1746, when, on taking leave of it, he delivered a discourse 'De Mathematicâ Barbarorum.' From Meissen he was sent to the University of Leipzig, where, though he attended many courses of lectures on various branches of learning, his application was not very regular, his attention now beginning to be directed to other pursuits. He began here to form several literary friendships and connections, and acquired a decided taste for the theatre, much to the dissatisfaction of his parents and his sister, who warned him against it as being not only trifling but sinful; while it was also with the extremest difficulty that the family could contribute any allowance for his support. This latter circumstance convinced Lessing that it was time for him to think of shifting for himself. Accordingly he determined to devote his talents to poetry, criticism, and belles-lettres, as that field of literature which had been least of all cultivated by his countrymen, and where, besides having few rivals, he might employ his pen with greater advantage to others as well as to himself. His first productions were one or two minor dramatic pieces, which were printed in a journal entitled 'Ermunterungen zum Vergnügen.'

The departure of his friend Mylius for Berlin determined Lessing to follow him thither, as he hoped there to find himself more favoured by opportunities for literary undertakings. In conjunction with Mylius he began a quarterly publication, 'Beiträge zur Historie des Theaters,' wherein they intended to take an historical and critical view of the drama throughout Europe, a subject then hardly touched upon. The work however was not carried on beyond its fourth number. About the same time he published some of his early poems, and set about studying Spanish, from which he shortly after translated Huarte's 'Examen de los Ingenios;' but he might easily have selected something more likely to fix public attention. Perhaps he showed still less judgment when, in conjunction with his younger brother, Johann Gottlieb, he commenced a Latin translation of Klopstock's 'Messiah,' as if he should be rendering his mother tongue and his countrymen a service by diverting them from the original poem—one that forms an epoch in and gave such an impulse to the German language. Fortunately the brothers learned that a similar translation was undertaken by the Danish chaplain at Madrid, on which they abandoned the task. At this time Lessing was residing at Wittenberg, where his brother was pursuing his studies; but he again returned to Berlin, and formed a close intimacy with Moses Mendelssohn and Nicolai, which had a highly beneficial influence upon all the three. Six eyes, as one of his biographers expresses it, see more than two, especially when one pair of them is fixed upon what is at a distance, another upon what is close by, and the third upon what lies between those extremes. It is not always that such literary partnerships are successful, but in this case there was sympathy of minds and dispositions, together with unity of purpose. One of the first results of Lessing's and Mendelssohn's joint studies was the dissertation 'Pope als Metaphysiker' (1754), the object of which was to show that the English poet had no fixed philosophical system.

Omitting mention of his other literary connections, among whom Ramler stood high in his private esteem, and also of his various translations and less important productions, belonging to this period, we pass on to his 'Miss Sara Sampson,' the first specimen of domestic tragedy in German literature. In vain did the critics object to it, that it was a dramatic nondescript, and that it was made up of reminiscences of English novels and tragedies. Little cared the public how it had been produced: it was enough for them that they felt its power and its beauties: it accordingly not only excited a great sensation in Germany, but was translated in other countries. Between this and his next dramatic masterpieces, 'Minna von Barnhelm' and 'Emilia Galotti,' which latter, though composed in 1763, was not ultimately dismissed from the hands of its author till 1772, was an interval which, so far from have been passed unoccupied, astonishes us by the multitude and variety of the subjects on which Lessing then employed his pen.

In 1757 he and his friends Mendelssohn and Nicolai undertook the 'Bibliothek der Schönen Wissenschaften,' which may fairly be said to have been the best literary journal Germany could then boast, and even now it may be referred to with both pleasure and profit for the valuable information and pieces of criticism which it contains. To this period, from 1753 to 1760, during which he resided at Berlin, belong his 'Fables' and his 'Litteraturbriefe,' or 'Letters on Literature' (1759), a life of Sophocles, after the manner of Bayle, and a translation of Diderot's dramatic pieces. From 1760 to 1765 Breslau was his residence, he having accepted the appointment of government secretary to General Von Tauenzien. Here he found himself quite in a new sphere, very advantageous in some respects but in others the reverse; for, greatly to the astonishment of all, he began to addict himself to play with an eagerness quite at variance with a philosophical temperament. If he seldom suffered in pocket, being generally successful at the faro-table, he probably suffered in health, for such was his agitation even while winning, that the perspiration would drop from his forehead. He did not however neglect his studies and his

pen, but employed the latter on several antiquarian and literary subjects and topics of criticism.

At length he gave up faro and his appointment; returned to Berlin, and the following year published his celebrated 'Laocoon,' the most finished of his prose works, although in itself incomplete. The following year was marked by another literary triumph, namely, his 'Minna von Barnhelm,' and the succeeding one by his 'Dramaturgie' and the 'Antiquarische Briefe.' After this he was preparing to put into execution his long-meditated journey to Italy, when his friend Ebert obtained for him the situation of keeper at the Wolfenbüttel Library (1770), of which celebrated and extensive collection, comprising about 10,000 manuscripts, and 200,000 printed volumes, he published an account entitled 'Wolfenbüttelschen Fragmente,' 1773. His 'Emilia Galotti,' which, after long remaining in an unfinished state, was completed and published in 1772, has been criticised as manifesting more of psychological study than of poetical impulse. His last drama, 'Nathan,' which was translated many years ago by the late William Taylor of Norwich, was also almost the last of all his literary productions. From that time, 1779, his health and spirits visibly declined very fast; he became subject to attacks of somnolency in such a degree that he was unable to rouse himself, or even keep awake in the society of his most agreeable friends; thus affording another striking instance of great mental power succeeded by complete exhaustion, and that prematurely, for he had entered only into his fifty-third year when he died, February 16, 1781.

Few writers who have written so much have written so carefully; and considered with regard to style alone Lessing's works had a most beneficial influence upon German literature. Among them are several masterpieces of various kinds, including his admirable Fables; yet it is not so much for these as for what he did for their literature generally that his countrymen are indebted to him. He was the first to bestow upon it those graces and those æsthetic qualities in which it had till then been deficient.

His brother KARL GOTTHELF LESSING (born 10th July 1740), who published his biography and some posthumous pieces, in 1793, wrote several comedies, which, although now almost forgotten, were not without merit for their humour and liveliness and also exhibited considerable dramatic talent.

* LESSING, KARL FRIEDRICH, was born at Breslau, February 8, 1808. His father (a nephew of the poet Lessing), wishing his son to become an architect, sent him to Berlin in 1821 for the purpose of studying architecture. Young Lessing however had set his heart on being a painter, and by the advice of Professor Kösel directed his attention to landscape, which he studied to such purpose that his first picture, 'The Churchyard,' produced a great impression. But attracted to Düsseldorf by Wilhelm Schadow, he there turned to historical painting, and soon came to be regarded as one of the most promising of the young painters who were looking up to Schadow as their guide. Among the more important works which he produced in this his first manner, as it is termed, are the cartoon of the 'Battle of Iconium;' 'The Castle by the Sea-side;' 'The Court-yard of the Convent—a Snow scene' (now in the Museum at Cologne), a singularly poetical work which became very popular; 'The Death of Frederick II.;' a 'Scene from Lenore;' 'The Robber,' a very striking genre picture, with a remarkably rich landscape; and above all his 'Royal Mourners,' first exhibited at Berlin in 1830—a work of great purity and elevation of style and powerful expression; for the head of the king it may be noticed Schadow set as a model. He now again for awhile studied landscape amidst some of the wilder scenery of Germany, and produced some very striking forest and mountain views, and a grand 'Scene in the Eifel,' which was greatly admired. But again, in 1838, Lessing returned to history, but this time adopting a bolder, richer, and less severe manner. His first picture was the 'Tyrant Egselein in Captivity refusing the exhortations of the Monks.' His grand work, 'Hues before the Council of Constance,' was finished in 1842, and at once took its place as one of the most important productions of the school of Düsseldorf. It was followed by the 'Capture of Pope Paschal II. by the Emperor Henry II.' The choice of these subjects, and the earnest treatment of them completed the rupture, which had for some time been imminent, between Lessing and that section of the modern German school of painting which boasted itself strictly Roman Catholic, and which had adhered with inflexible rigidity to the severe style of art inaugurated by Veit, Schadow, &c. As in theology so in art Lessing had been gradually breaking away from this school, and adopting the freer and more dramatic style, which has distinguished all his later works; and under his influence the younger Düsseldorf painters have likewise adopted a similarly free and varied manner. Of his later works may be mentioned the 'Battle of the Mongols (1241) near Liegnitz,' 'A Scene in the Hussite War,' 'Passage of the Crusaders to the Holy Sepulchre,' 'Knight by the Well,' &c. Lessing is a painter of great original power, of a thoroughly poetical turn of mind, and possesses much mental vivacity and an earnest love of nature: and he is well-fitted to be the leader in the reaction from that style which at first was of the greatest value in its elevation and purity, but seemed to be fast merging into formality and mannerism.

L'ESTRANGE, SIR ROGER, was born in Norfolk in 1616. Like his father, he was a royalist, and he accompanied Charles I. to Scotland in 1639. He was arrested by the emissaries of the parliament

in 1644, and sentenced to be shot as a spy, but some delay having protracted the execution of this sentence, he managed to escape, in 1648, and attempted to raise an insurrection in Kent. This having failed, he fled the country, but returned in 1653, hoping to take advantage of the general act of amnesty. Cromwell having taken his part, his hopes were realised, though this circumstance caused him to be eyed with some suspicion by his friends the royalists. After the Restoration he was appointed censor of the press, and in 1665 he brought out a paper called the 'Public Intelligencer.' He was devoted to the court, and on the approach of the Revolution of 1688 lost all his appointments. He died in 1704.

His works consist of a vast number of political pamphlets, besides translations of Josephus, Cicero's 'Offices,' Seneca's 'Morals,' Erasmus's 'Colloquies,' Æsop's 'Fables,' Quevedo's 'Visions,' &c. He is generally and very justly censured for having used too many vulgar and coarse expressions in his versions of classic authors, but on a reference to Echard's low translation of 'Terence' it will be found that this fault was not peculiar to L'Estrange.

LE SUEUR, JEAN-FRANÇOIS, a very distinguished French composer, knight of the Légion d'Honneur, and director of the music of the Emperor Napoleon I., was the descendant of an ancient family, and born in 1766. After having been Maître de Chapelle of several cathedrals in France, for which he composed a great number of masses, motets, &c., his reputation called him to Paris, where he produced his five grand operas: 'La Caverne,' 'Paul et Virginie,' 'Télémaque,' 'Les Bardes,' and 'La Mort d'Adam,' all of which display more or less vigour of imagination, grandeur of style, and judgment in execution; qualities which induced Sacchini to say, that he knew but two Italians who could be compared to him. That M. Le Sueur possessed a strong active mind may be inferred from his compositions; but of this he gave other proofs, as well as of literary talent; his work on music adapted to sacred solemnities, is highly esteemed; and a notice by him concerning ancient music, accompanying the translation of 'Anacreon' by M. Gail, not only shows considerable learning, but, in the opinion of M. Ginguené, has thrown some new light on that very obscure subject, the music of the Greeks.

LEUCIPPUS, a Grecian philosopher, is generally regarded as the original propounder of what has been called the atomic philosophy. The time and place of his birth are unknown; he was the disciple of Zeno and the teacher of Democritus, and was born, according to Diogenes Laert. (ix. 30), either at Elis, Abdera, or in the island of Melos. None of his writings have come down to us, with the exception of a few fragments of a treatise 'On Mind,' which have been preserved by Stobæus. Some account of his philosophical doctrines is given by Diog. Laert. ix. 30; Aristotle, 'De Anima,' i. 2; Plutarch, 'De Placitis Philosoph.' c. xvii., p. 883, E.; Cicero, 'De Nat. Deor.,' i. 24; Laetantius, 'Divin. Instit.,' iii. 17; 'De Ira Dei,' c. 10; Fabricii, 'Bibliotheca Græca,' vol. ii., p. 658, 659, ed. Harles; Bayle, 'Diet.,' and the article DEMOCRITUS in this work.

LEUNCLAVIUS, JOHN (the Latinised form of his real name, Loewenklaus), was born in 1533 at Amelburn, in Westphalia. He was one of the most distinguished scholars of his age; he was well acquainted with the Latin and Greek languages, the Roman law, and the writings of the fathers, and also with Turkish, which he learnt during his residence at Constantinople. He died at Vienna, 1593.

The most important of the works of Leunclavius are:—Editions of Zosimus, Procopius, &c., Basel, 1579; Manuel Palæologus, Basel, 1573; Dion Cassius, 1592 and 1606; Xenophon, 1569, Par., 1622, 1625; John of Damascus, Basel, 1578; and many treatises of the fathers. He also wrote 'Commentatio de Moscorum bellis adversus finitimos Gæstis,' in Pistorius's collection of Polish historians, 1655; 'Musulmanica Historiæ, libri xviii.,' Frank, 1595; 'Annales Sultanorum Othomanidarum,' Frank, 1596, a translation from the German of Gaudier; 'Jus Græco-Romanum, tam Canonicum quam Civile,' Frank, 1596; 'Versio et Notæ ad Synopsim LX. Librorum Basilicon, seu universi juris Romani et ad Novellas imperatorum,' Basel, 1575, Leyden, 1617.

LEUSDEN, JOHN, was born at Utrecht in 1624. He studied the Oriental languages, and particularly Hebrew, with great success at the universities of Utrecht and Amsterdam. In 1649 he was appointed professor of Hebrew at Utrecht. He died in 1699. Leusden was one of the best Hebrew scholars of his age, though perhaps not equal to the Buxtorfs. Some of his works may still be consulted with advantage.

The most important of Leusden's works are:—'Philologus Hebræus,' Ut., 1656, 1672, 1695, Amst., 1686; 'Philologus Hebræo-Mixtus,' Ut., 1663, &c.; 'Philologus Hebræo-Græcus,' Ut., 1670, &c. (these three volumes contain many curious discussions on the original languages of the Bible, the state of the Hebrew and Greek text, and that of the Septuagint, as well as considerable information on Jewish rites and antiquities); 'Jonas Illustratus,' Ut., 1656; 'Joel Explicatus,' &c., Ut., 1657; 'Scholia Syriaca,' 1658-72; 'Onomasticon Sacrum,' 1665; 'Clavis Hebræica et Philologica Veteris Testamenti,' Ut., 1683, a useful book for beginners; 'Clavis Græca Novi Testamenti,' Ut., 1672; 'Compendium Græcum Novi Testamenti,' Ut., 1674, &c.; best edition, 1762; 'Compendium Biblicum,' Ut., 1674, Halle, 1736; 'Novum Testamentum Græcum,' Ut., 1675. He also wrote the Preface and Introductions to Athias's 'Hebrew Bible,' Amst. (1661-67), and edited Pool's 'Synopsis Criticorum' (1684), and the works of Lightfoot (1699),

and Bochart (1675, 1692). He published several Manuals of Hebrew Grammar, which however are almost entirely taken from Buxtorf. He had commenced an edition of the Syriac version of the New Testament, which was published after his death by Schaaf, Leyden, 1708.

LEUWENHOEK or LEEUWENHOEK, ANTHONY VAN, was born at Delft in Holland in 1632, and does not seem to have had the advantage of a learned education. The skill which he possessed in grinding glasses for microscopes first brought him into notice, and his microscopes were said even to excel those of the celebrated Eustachio Divini. He did not confine his attention however to the mechanical construction of instruments, but made many researches on the minute structure and composition of various animal fluids and solid textures, and he acquired great fame as an anatomist and physiologist. Dr. De Graaf introduced him to the notice of the Royal Society of London, and the greater number of his discoveries and researches were published in the 'Philosophical Transactions' of that body. His first communication was transmitted to the Royal Society by De Graaf in 1673. His contributions to the 'Philosophical Transactions' became afterwards numerous and important, and amounted altogether to about 112 papers, which are included between No. 94 and No. 330 of that work. In 1680 he was chosen a Fellow of the Royal Society, and he was made a corresponding member of the Academy of Sciences at Paris in 1697. He appears to have passed the whole of his life at his native place, devoting his time to microscopic researches, chiefly relating to anatomy; and the success which attended his observations is said to have principally arisen from his having paid the most minute attention to the grinding and polishing of single lenses, which he always used in preference to the compound microscope.

The subjects of Leuwenhoek's labours were so numerous, that we can only briefly mention some of the most important of them. Some of the antagonists of Harvey objected to his doctrine of the circulation of the blood on the ground that, if the blood passed directly from the arteries into the veins, it could not nourish the parts through which it flowed. This question was undecided, when Leuwenhoek communicated a memoir to the Royal Society, in which he stated, as the result of his experiments, that, contrary to the opinion of Harvey, the passage of the blood was not immediate from the arteries into the veins. However in 1690, having very carefully re-examined the course of the circulation through the minute vessels of a part with a more perfect microscope, he discovered and clearly demonstrated that the arteries and veins are continuous. He even refused to admit that there is any division between the arterial and venous capillaries, because he said that it is impossible to determine where arteries terminate or veins begin. The latest investigations have proved the conclusions of this great microscopist to be nearly correct; for though the transit of the blood from arteries to veins can be observed by means of the microscope in many transparent parts, as the web of the frog's foot, yet the nature of the minute or capillary vessels through which the communication is effected is imperfectly understood.

At the time when Leuwenhoek made these observations the chemical doctrines reigned in medicine, and all the processes in the animal economy were explained by chemical changes: the blood was said to undergo the process of fermentation. Leuwenhoek triumphantly opposed this hypothesis, objecting to it that, if fermentation took place, bubbles of air would be generated in the vessels, which could never be observed. He also directed his attention to the form of the globules of the blood, which Malpighi had already discovered. Leuwenhoek stated that they are oval and flattened, and that each is composed of six exceedingly minute conical particles, which separately do not reflect the red colour, but which by their union communicate to the blood the physical properties which it presents. This theory served as the basis of that of Boerhaave on inflammation. Leuwenhoek stated, in proof of his hypothesis, that the red capillary vessels divide into smaller branches, in which the circulation is beyond the influence of the heart, and where the blood appears white because its globules are divided so as to accommodate themselves to the size of the canals through which they pass. Later experiments have shown the fallacy of these ideas on the blood.

The brain and nerves were also the subjects of his researches. He described the cortical substance as being entirely vascular, and said that the vessels which compose it are five hundred and twelve times smaller than the minutest capillaries; and that the globules which compose the fluid contained in these vessels are thirty-six times more minute than those which form the red blood. Fresh experiments made him change his opinions, and in 1717 he showed that the brain and nerves are fibrous structures, and that the blood-vessels glide between the fibres which compose these tissues. These observations very nearly agree with those of modern anatomists as to the structure of the brain; the only part in which Leuwenhoek seems to have been deficient was in a clear knowledge of the difference of structure between the cortical or grey and the medullary or white parts of the brain. Thus when he discovered that the latter was fibrous, he supposed that the former must be so also; whereas the cortical substance is composed almost entirely of blood-vessels connected by exceedingly fine cellular membrane, as first stated by Leuwenhoek, and investing, as has been since ascertained by Valentin, small grey globules or granules. It is now universally agreed that the medullary part of the brain is composed of fibres.

Leuwenhoek examined the structure of the crystalline lens, and described with exactness the disposition of the layers which compose this part of the organ of vision; and he embellished his description with several very good figures.

Much has been said concerning his investigation of the well-known and celebrated spermatic animalcules, which since the time of their first discovery in 1677 have excited the curiosity and speculative fancy of many naturalists. Haller states that Ludwig Hamm (a student at Leyden) was the first discoverer of the seminal animalcules, in August 1677. Leuwenhoek, who minutely described them, claimed the merit of having made the discovery in the November of the same year; and in 1678 Hartseker published an account of them, in which he professed to have seen them as early as 1674. A great deal has since been written upon them by Needham, Buffon, Der Gleichen, Spallanzani, Prevost and Dumas (their experiments were made together), Wagner, and others.

Leuwenhoek would have made both more numerous and more valuable discoveries, if he had possessed greater erudition, which would have enlarged his ideas, and prevented him from mistaking, as he did in some instances, probabilities for facts. Thus he often fancied that he saw what did not exist, and afterwards he persisted in his error. Among other mistakes he considered that the villous or mucous coat of the intestines was muscular; he also maintained that pulsation belonged to veins, and not to arteries.

Leuwenhoek's reputation was very extensive. When Queen Mary was in Holland, she paid him a visit, and she was highly delighted with his curiosities. He presented her with two of his microscopes. When the Czar Peter the Great was passing through Delft in 1698, he sent two of his attendants to request Leuwenhoek to pay him a visit, and to bring his microscope with him. The philosopher, after having shown his instruments to the emperor, exhibited to him the curious phenomenon of the circulation of the blood in the tail of an eel.

Leuwenhoek died at Delft in 1723. Besides his contributions to the 'Philosophical Transactions,' he published about 26 papers in the 'Memoirs of the Academy of Sciences.' His writings were collected and published separately in Dutch at Delft and Leyden; they were also translated for him into Latin, and printed at Delft, in 4 vols. 4to, in 1695-99. An English translation was made from the Dutch and Latin editions in 1798-1800, by Mr. Samuel Hoole, in 4to. At his death he bequeathed to the Royal Society of London a small Indian cabinet, in the drawers of which were contained thirteen little boxes or cases, each holding two microscopes handsomely mounted with silver, of which not only the lenses but the whole apparatus were made with his own hands; each microscope had an object placed before it, of which there was an accompanying drawing made by himself.

(*Philosophical Transactions for 1723; Biographie Universelle, &c.*)

LEVER, CHARLES JAMES, novelist, was born in Dublin, in 1808, and educated at Trinity College, Dublin, where he graduated, subsequently taking a degree at Göttingen. As a physician, Mr. Lever was attached to the legation at Brussels, and practised three years; but resigned for the more genial employment of the editorship of the 'Dublin University Magazine.' Then commenced that enormous list of novels which opened with 'Harry Lorrequer,' and for years bore no other name. 'Charles O'Malley,' 'Tom Burke,' and others succeeded; and a new vein of literature—the literature of animal spirits—was found to have been opened. The hairbreadth adventures, and wonderful escapes, which were never complete unless on horseback, proved very attractive; and were, it is only fair to add, well aided by the earlier sketches of Mr. Hablot Browne. After some few years Mr. Lever became fatigued by the angry political strife which his periodical involved, and he retired to the Continent, first occupying an old castle in the Tyrol, and subsequently settling at Florence, where he remains. From the period of his retirement from active magazine life, his writings have been marked by very considerable improvement in tone and matter. They are more artistic—more thoughtful—and depend less upon broad incident. 'The Knight of Gwynne' is especially remarkable for this,—and contains capital pictures of Irish life in the stirring times of the Union. But period of life, as well as change of occupation, may have induced this. Mr. Lever's anonymous writings are only less numerous than those acknowledged: amongst them being 'Ceu Cregan,' an Irish Gil Blas, and the 'Diary of Horace Templeton.' To a certain extent Mr. Lever is known to have been the hero of his adventurous stories. He passed his earlier years in breaking horses, and what time could be spared from horses was commonly devoted to boating. So late as the present autumn he has suffered shipwreck in the classic Gulf of Spezia, and with a youthful daughter was only rescued after battling for an hour with the waves, in which thirty-four years since Shelley lost his life. A cheap edition of all the writings of this popular author is announced as in preparation.

LEVERIDGE, RICHARD, a celebrated singer towards the end of the 17th and beginning of the 18th centuries, for whom Purcell wrote most of his bass songs. He was in much request in all convivial parties, and as he possessed a talent for lyrical poetry as well as for musical composition, several of the songs by which he delighted his audiences were wholly the offspring of his own genius. Among these

Dr. Burney mentions 'Ghosts of every occupation,' which he had heard performed by the bard himself. But we introduce his name here chiefly on account of his having set the music to Gay's 'Black-Eyed Susan,' an air which, for tenderness, beauty, and fitness, has few rivals, and is one of the many that prove, to every candid mind, the English talent for music. During his life, Leveridge published several of his songs, in two 8vo volumes; and, though far from abstemious, he reached the advanced age of eighty-eight, dying in 1758.

LEVERRIER, URBAN-JEAN-JOSEPH, was born at St. Lo, in the department of La Manche, in France, on March 11, 1811. He was educated successively at the college of St. Lo, at Caen, and at Paris, and was admitted to the Polytechnic School in 1831. His early inclination seems to have been towards chemistry, as he published in 1837 two essays on the combination of phosphorus with hydrogen and with oxygen, and contributed some chemical papers to the 'Dictionnaire de la Conversation.' He began next to distinguish himself as an astronomer, and his 'Tables de Mercure,' and some essays 'sur les inégalités séculaires,' which appeared in the 'Connaissance des Temps,' procured his admission to the Académie des Sciences in January 1846, where he succeeded Jean-Dominique Cassini. In this year he made his grand discovery of the new planet Neptune. He had begun in 1845, at the instance of Arago, to investigate the orbit of Uranus, and from certain perturbations, which he reduced to calculation, proved the necessary existence of a new planet to account for them, and indicated the place where it would probably be found. After a few previous papers to the Institute on the results of his investigations on November 10, 1845, June 1, and August 1, 1846, on the 5th of October 1846, in the 'Connaissance des Temps' for 1849, his theory was fully developed. Suspicions of the existence of such a cause for the disturbance had been previously expressed by Messrs. Bouvard and Bossell. We have already mentioned that in England Mr. Adams had been pursuing a similar course, and had arrived at the same results somewhat earlier, but had printed nothing. [ADAMS.] Alexander von Humboldt, in a note to his 'Cosmos' (n. 640, vol. iii.), thus notices the dates of the steps in the discovery of Adams and Leverrier—Leverrier's we have given: "Adams, without printing anything, laid the first results which he obtained for the perturbing planet before Professor Challis in September 1845, and the same, with some modification, in the following month, October 1845, before the astronomer-royal, still without publishing anything. The astronomer-royal received from Adams his final results, with some fresh corrections relating to a diminution of the distance, in the beginning of September 1846. The young Cambridge geometrician has expressed himself with noble modesty and self-denial on the subject of this chronological succession of labours, which were all directed to the same great object. 'I mention these earlier dates merely to show that my results were arrived at independently and previously to the publication of M. Leverrier, and not with the intention of interfering with his just claims to the honour of the discovery; for there is no doubt that his researches were first published to the world and led to the actual discovery of the planet by Dr. Galle: so that the facts stated above cannot detract in the slightest degree from the credit due to M. Leverrier.'" On the verification of Leverrier's discovery honours of all kinds were showered upon him; he was created Professor of the Faculty of Sciences, member of the Bureau de Longitude, director of the observatory, an officer of the Legion of Honour, and was chosen member of the Legislative Assembly by the department of La Manche; the Duke of Tuscany presented him with the works of Galileo, and the Royal Society of England bestowed on him the gold Copley medal and elected him a member. On the revolution of December 2, 1851, he took part with the present Emperor of the French, was shortly after named a senator, and on the death of Arago succeeded him as astronomer to the Bureau de Longitude.

LEWES, GEORGE H., was born in London on the 18th of April 1817. After being educated at various schools, including that of Dr. Burney at Greenwich, he was for some time in a mercantile office, which he left while still very young with the intention of studying medicine. He proceeded a considerable way in his medical studies; and the knowledge he then acquired has been of use to him in not a few of his subsequent labours as an author. Abandoning, however, medicine as a profession, he chose that of literature. In 1838 and 1839 he resided in Germany, acquiring a knowledge of German life and of the German language and literature; and as he was already acquainted with French, Italian, and Spanish, he thus began his literary career with a very unusual amount of accomplishment in the modern tongues of Europe, in addition to the more customary knowledge of the classical tongues. Since the year 1839 Mr. Lewes has resided chiefly in London, and has been incessant in his literary labours; and few British authors have written so largely or have exhibited so much versatility in their choice of subjects combined with such unflinching freshness of power in each. He has contributed contemporaneously or successively to the 'Edinburgh,' 'Westminster,' 'British and Foreign,' 'Foreign Quarterly,' and 'British Quarterly' Reviews; to 'Blackwood's,' 'Fraser's,' and other magazines; to the 'Classical Museum,' and to the 'Morning Chronicle,' 'Atlas,' and 'Leader' newspapers: of this last-named paper, the 'Leader,' he was literary editor from its commencement in 1849 to the year 1854. He also contributed various articles to the 'Penny Cyclopaedia.' A mere enumeration of the titles

of these contributions to periodicals—some on classical subjects, some on foreign literature, some historical, and some philosophic or scientific—would occupy a large space, and would give an idea of an industry and a mental range rarely equalled. We may add that scarcely an article that has proceeded from Mr. Lewis's pen but has been eminently readable; while not a few have attracted great notice, even in their anonymous form, on account of their striking views and vivid and sparkling style. Among the most remarkable of those of deeper character was an article on Spinoza contributed to the 'British and Foreign Review.' These contributions to periodicals and journals, however, represent but a portion of Mr. Lewis's activity. He is also the author of numerous acknowledged works. In the year 1845 appeared his 'Biographical History of Philosophy,' occupying four volumes in Mr. Knight's 'Weekly Volumes'—a work of great merit, which has been extremely popular, and of which, as it is now out of print, the author is preparing a new and extended edition. Another work of Mr. Lewis's, published in Mr. Knight's Weekly Volumes in 1846, was 'The Spanish Drama: Lope de Vega and Calderon.' 'Ranthorpe: a Tale,' in one volume, was published in Messrs. Chapman and Hall's series in 1847; and 'Rose, Blanche, and Violet,' a regular novel, in 1848. 'The Life of Maximilian Robespierre, with Extracts from his unpublished Correspondence,' appeared in 1849; and in 1853, as one of the volumes of 'Bohn's Scientific Library,' 'Comte's Philosophy of the Sciences; being an Exposition of the Principles of the Cours de Philosophie Positive of Auguste Comte.' Mr. Lewis's latest, and in some respects his most important work, is his 'Life and Works of Goethe; with Sketches of his Age and Contemporaries from published and unpublished Sources,' 2 vols. 8vo, 1855. While preparing this work, Mr. Lewis spent some months at Weimar. Mr. Lewis is also known as a dramatic author. His tragedy entitled 'The Noble Heart,' was published in 1850, and was then acted successfully; and of his lighter dramatic performances, one entitled 'The Game of Speculation,' has had marked success. Of late years Mr. Lewis has turned much of his attention to natural science and to the more advanced order of speculations in connection with Physiology; and some of his articles on topics of this class, contributed more especially to the 'Westminster Review,' have exhibited not only rare powers of luminous exposition, but also a bold spirit of generalisation. A popular treatise on Physiology has been for some time expected from Mr. Lewis's pen.

LEWIS, Kings of France. [LOUIS.]

* LEWIS, SIR GEORGE CORNEWALL, BART., M.P., is the eldest son of the late Right Honourable Sir Thomas Frankland Lewis, Bart. (by a daughter of the late Sir George Cornewall, Bart.), many years M.P. for Ennis, Beaumaris, Radnor, and Radnorshire, who, having filled successively the offices of Secretary to the Treasury, Vice-President of the Board of Trade, Treasurer of the Navy, and Chairman of the Poor-Law Commission, was rewarded for his public services with a baronetcy in 1846, and died in 1855. Sir George Cornewall Lewis was born in October 1806, and having received his early education at Eton, was removed in 1824 to Christ Church, Oxford, of which he became student, and where he graduated B.A. in 1828, taking the highest honours in classics, and a second class in the mathematical school. In 1831 he was called to the bar at the Middle Temple, but never practised. Having previously held some inferior appointments, in the discharge of which he showed great capacity for business, he was appointed a Poor-Law Commissioner in 1839, and held that post until 1847, when he became Secretary to the Board of Control. In the following year he exchanged this appointment for the Under-Secretaryship of the Home Department, which was then administered by Sir George Grey. In 1850 he became Secretary of the Treasury, but resigned that post in 1852 on the retirement of Lord John Russell from the Premiership. In 1847 he had been elected M.P. for Herefordshire, which he represented in the Liberal interest down to the dissolution in 1852, when he failed to secure his re-election; and in the December of the same year he unsuccessfully contested Peterborough. In February 1855 he succeeded his father as the representative of his native county of Radnor, and had been only a few weeks in parliament when he was appointed by Lord Palmerston Chancellor of the Exchequer on the resignation of Mr. W. E. Gladstone, which office he still holds (Nov. 1856).

During twenty years of public life and of official engagements, Sir George Lewis has found time to employ his pen in the production of several deep and philosophical treatises. He first became known to the literary world by a translation of Müller's learned treatise on the ancient 'History and Antiquities of the Doric Race,' which he executed in conjunction with the late Rt. Hon. Henry Tufnell, M.P., and published in 1830 in 2 vols. 8vo. To it Mr. Lewis prefixed a preface, in which he states the philosophical principle on which he has composed his subsequent original historical treatises, and which was carried out with so much success by Niebuhr, namely, "the eliciting of historic truth out of mythical narratives." In such matters, writes Sir G. C. Lewis, "it is better to reject all than to believe all where the alloy of error is large. In these obscure regions the historian can only be safe when guided by a careful comparison of all the different legends of the numerous states and cities of Greece, so as to decipher their metaphorical language: by a study of the geography and nature of the country, the history and remains of art, and of religion, of ancient

inscriptions and coins, and of every other means which ingenuity can contrive for restoring from its fragments the ruined fabric of antiquity." In these words we find the key-note of all the political, philosophical, and historical works which the writer of them has composed, among which we ought more particularly to mention his 'Inquiry into the Credibility of Early Roman History,' an elaborate work in 2 vols. 8vo, in which he follows out the principles laid down by Niebuhr in his investigation into the received accounts of those early times; the 'Influence of Authority in Matters of Opinion;' and Essays on the 'Origin and Formation of Romance Languages,' on the 'Use and Abuse of Political Terms,' and the 'Government of Dependencies,' together with 'Remarks on Local Disturbances in Ireland,' a work of considerable merit for its liberality of tone and farsightedness of vision, which he first published in 1836. Besides the above he published in 1852 a 'Treatise on the Method of Observation and Reasoning in Politics,' in which he proceeds upon inductive principles to lay down a positive system of philosophy applicable to the study of politics. Like the rest of his productions this work is well stored with facts and illustrations, and consequently evinces a practical turn of mind rather than original powers of thought or imagination.

In the early part of 1854 Sir G. C. Lewis succeeded the late Professor Empson as editor of the 'Edinburgh Review,' but abandoned that field of literary employment on taking office as Chancellor of the Exchequer. In 1844 Sir G. C. Lewis married a sister of the Earl of Clarendon, the widow of Thomas Henry Lister, Esq., who is well known in the republic of letters as the authoress of 'Sketches of the Contemporaries of Lord Chancellor Clarendon,' her own great and venerable ancestor.

* LEWIS, JOHN FREDERICK, President of the Society of Painters in Water-Colours, is the son of Mr. F. C. Lewis, himself an engraver and landscape painter of very great ability. John Frederick Lewis was born in London in July 1805, and received his preparatory training in painting and engraving from his father. His earliest works of any importance were representations of wild animals, painted with remarkable power both in oil and water-colours, and several of them were engraved by himself. Visits to Italy and Spain led him to devote himself to figure-painting, and more particularly to representations of Spanish scenes and character. About 1835 and 1836 he exhibited several Spanish pictures, which won general admiration. Among the more remarkable of these were his series depicting a 'Bull-fight in Seville':—'The Opening of the Lists,' 'The Death of the Bull,' and 'The Suburbs of a Spanish City on the Day of a Bull-fight';—three pictures which in their powerful expression, vigorous execution, minute fidelity, and breadth and freshness of style were a novelty in the water-colour art. In 1837 Mr. Lewis exhibited 'A Fiesta in the South of Spain—Peasants dancing the Bolero,' and 'Peasants at their Devotions,' which were equally brilliant in style and execution; but the main attraction that year was his picture of 'A Spy of the Christiano Army brought before the Carlist General-in-Chief, Zumalacarrgui;' this and the 'Suburbs of a Spanish City' of the year before were engraved, and formed two popular prints. Mr. Lewis also published this year fac-similes of 25 of his 'Spanish Sketches,' drawn by himself on stone. Soon after completing these sketches and a few other Spanish pictures—of which 'Murillo painting the Virgin in the Franciscan Convent at Seville,' and the 'Pillage of a Convent in Spain by Guerilla Soldiers,' were exhibited in 1838—he again visited the Continent, where he stayed about a couple of years. At Rome Mr. Lewis painted a noble picture of 'The Pope blessing the People,' which he forwarded for exhibition at the Water-Colour Gallery, and then proceeded to Constantinople.

In all Mr. Lewis remained in the East ten years—from 1840 to 1850—his head-quarters being Cairo, but making various excursions into Asia Minor, &c. During this time only a few of his less important sketches were forwarded to Europe, but he brought home with him a portfolio more richly stored with studies of eastern life and scenery than had ever before been obtained by an English artist. The effect of his sojourn in the East appeared in the Water Colour Society's exhibition, 1850, in a picture of considerable size entitled 'The Hhareem,' a representation of a Turkish dignitary seated on a divan, with his three wives, while a newly purchased Abyssinian slave is being introduced by an Arab female. The work produced a great impression. To a considerable extent it was a novelty in art, and though the subject appeared to be voluptuous in character it was treated with the utmost chasteness and refinement. As a work of art it was admitted on all hands to be almost perfect in execution, combining a degree of minute finish scarcely equalled, with great breadth and vigour of effect; and rich and delicate in tone and colour: the capabilities of water colours had in fact scarcely ever been so fully brought out before. In 1852 Mr. Lewis exhibited an 'Arab Scribe—a Scene in Cairo,' even more remarkable than the Hhareem for elaborate finish, but less striking as a whole; while in his pictures exhibited at the Water-Colour Gallery in 1854—'Halt in the Desert,' 'Bedouins and their Camels—a Scene in the Desert of the Red Sea,' and 'Roman Peasants at a Shrine,' he appeared to be trying experiments in colour, without adding thereby to the effect of his pictures; and in neither of his subsequent pictures, 'The Well in the Desert, Egypt' (1855), and 'A Frank in the Desert of

Mount Sinai' (1856), has he quite recovered his old richness of colour, though the last work is a marvel of executive skill.

About the time that Mr. Lewis began to paint in water-colours in so much more cold a manner than his wont, he was applying himself with great diligence to oil-painting, and he sent to the Royal Academy exhibition of 1855 a picture under the title 'An Armenian Lady—Cairo,' which more than rivalled in minute finish the works of the pre-Raphaelite painters, while it had none of their quaintness or want of atmosphere. To the exhibition of 1856 he contributed 'The Greeting in the Desert, Egypt,' and a 'Street Scene in Cairo, near the Babel Luk.'

Mr. Lewis's remarkable technical skill has not been attained without diligent study of the great masters, as well as of nature. Some sixty odd of his elaborate copies in water-colours of the great Italian and Spanish painters were, with wise liberality, purchased by the Scottish Academy for the instruction of the students; and the Academy elected him an honorary member. In 1855 the Society of Painters in Water-Colours elected Mr. Lewis their President, the highest professional honour a water-colour painter can receive.

LEWIS, MATTHEW GREGORY, a writer of novels, poems, and dramatic pieces, was born at London on the 9th of July 1775. His father was deputy secretary-at-war, and was connected with many families of rank and wealth; his mother was a daughter of Sir Thomas Sewell, master of the rolls. Lewis studied at Christchurch, Oxford, and afterwards lived for some time in Germany; there he became acquainted with Göthe and his followers, and imbibed the mysterious and tragic spirit of which his writings are full. Previous to his residence in Germany, when only sixteen years old, he wrote a successful comedy, called 'The East Indian.' The novel by which he is chiefly known, 'The Monk,' was published in 1794, when he was in his twentieth year. In the skilful employment of supernatural and mysterious agencies, and the display of horrors, it is perhaps unrivalled in the English language. A considerable portion of its details are devoted to the operations of the lustful passions on the character of a man violent and unscrupulous in his nature, but under the restraint of monastic vows. The young novelist drew the character broadly and offensively; and the singular lubricity of a performance, calculated by its genius and adaptation to the taste of novel readers to be extensively circulated, excited much indignation. It is understood that the Society for the Suppression of Vice applied to the attorney-general to take legal steps against Lewis. These attacks only swelled the author's fame. At that time it was rather favourable to the success of a work of genius that its morality was not perfectly pure, and Lewis had the satisfaction of being a much courted and slightly abhorred man. His character, as represented in his published letters, is singularly at variance with that which might be derived from the study of his works. He appears to have been good-hearted, simple, affectionate, and not addicted to any vice. He had a very difficult part to maintain in his intercourse with his parents, his mother having, on account of her levities, long been separated from her husband. Although he could not vindicate her conduct, he gave her his kindest sympathies. It is a singular circumstance in his life, that, after having lived for some time on bad terms with his father, the latter dying in a temper which precluded the son from any hope of succession, yet left him, with slight exceptions, his whole fortune. This event made Lewis a rich West India proprietor. He was very kind to his slaves, and his occasional visits to his estates in Jamaica were welcomed as occasions of public rejoicing both among his own slaves and those in the neighbourhood of his estates. His poetical pieces, including 'Alonzo the Brave,' 'Bill Jones,' &c., are well known; they are distinguished by the fluency of their versification, and the distinctness and power with which they narrate horrible and tragical incidents. There is however in all his writings a tone of barbarous and exaggerated taste. In 1812 he introduced to the stage the drama of 'Timour the Tartar,' which is said to have had much influence in creating the taste for gorgeous pageants, from which the British stage has not yet relieved itself. Lewis died at sea, on the 14th of May 1818, when on the way home from a visit to his Jamaica estates. His 'Residence in the West Indies' has been reprinted in Murray's 'Home and Colonial Library.' (*Life and Correspondence of Matthew Gregory Lewis*, 8vo, London, 1839.)

LEYBOURN, WILLIAM, a mathematician of the 17th century. The date of his birth is unknown, but Dr. Hutton supposes his death to have happened about the year 1690. He was originally a printer in London, and published several of the works of Samuel Foster, the Gresham professor of astronomy. Subsequently he became an author himself, and appears to have attained to considerable eminence as a practical mathematician. Among his published works are—'Arithmetic,' 1649; 'The Art of Numbering with Napier's Bones,' 1667; 'Complete Surveyor,' 1653; 'Geometrical Exercises,' 1669; 'Art of Dialling,' 1687; 'Mathematical Recreations,' 1694; 'Panarithmologia, or Trader's Guide,' 1693; 'Cursus Mathematicus,' comprising Arithmetic, Geometry, Cosmography, Astronomy, Navigation, and Trigonometry, fol., 1690. He also edited the works of Gunter.

LEYDEN, JOHN, M.D., was born on the 8th of September 1775, at Denholm, a village on the banks of the Teviot, in the parish of Cavers and county of Roxburgh. His parents, who were engaged in farming, gave him as good an education as their means allowed. After

making great progress in his studies, he was sent to Edinburgh in 1790, with the view of studying for the Church. He was highly distinguished at college by his diligence and attainments, and made considerable progress in the Hebrew, Arabic, and Persian, and acquired also the French, Spanish, Italian and German, as well as the Greek and Latin languages. In 1798 he was ordained as a minister in the Presbyterian Church; but he never obtained any popularity as a preacher, and finding that he was not likely to succeed in that profession, he applied himself to the study of medicine, and was appointed in 1802 as assistant-surgeon in the East India Company's service.

In 1808 he arrived at Madras, and immediately directed his attention to the study of the eastern languages. In addition to the Sanscrit, Arabic, Persian, and Hindustani languages, he made himself master of many of the languages spoken in the Deccan, and obtained an extensive knowledge of the Malay and other kindred tongues. During his residence in India he was promoted from the office of surgeon to the professorship of Hindustani in Fort William College; and shortly afterwards to the office of judge of the Twenty-four Pargunnahs of Calcutta. In 1809 he was appointed one of the commissioners of the Court of Requests in Calcutta; and in the following year to the still more profitable situation of Assay-Master at the Calcutta Mint. He accompanied Lord Minto in the expedition against Java in 1811, and died in that island on the 23th of August, in the thirty-sixth year of his age.

Leyden did not publish much upon the eastern languages, but what he has written bears evidence to the extent of his knowledge. His treatise 'On the Languages and Literature of the Indo-Chinese Nations,' published in the tenth volume of the 'Asiatic Researches,' contains an investigation of the origin and descent of the various tribes that inhabit the Malay peninsula and islands, and a comparison of their languages and customs; and his observations 'On the Roshe-niah Sect,' published in the eleventh volume of the 'Asiatic Researches,' gives an account of an heretical sect among the Afghans, which appears to have arisen shortly before the accession of Akbar. His translation of the 'Malay Annals' was published after his death by his friend Sir Stamford Raffles; and his manuscripts contained many valuable treatises on the eastern languages, translations from Sanscrit, Arabic, and Persian works, and several grammars of different languages, particularly one of the Malay and another of the Prakrit.

Leyden was an ardent admirer of poetry, and published many poems at various times, which were collected and published after his death by the Rev. James Morton, under the title of 'Poetical Remains of the late Dr. John Leyden,' Lond., 1819. He also contributed numerous pieces to Scott's 'Minstrelsy of the Scottish Border,' he having accumulated in his youth an amazing store of the ballad literature of his native country, and edited the 'Complaint of Scotland,' an ancient political tract in the Scottish language, as well as 'Scottish Descriptive Poems.' He was the author of 'A Historical and Philosophical Sketch of the Discoveries and Settlements of the Europeans in Northern and Western Africa, at the close of the eighteenth century;' of which an enlarged edition was published by Mr. H. Murray in 1818.

(Morton, *Memoirs of Dr. Leyden's Life*, prefixed to the 'Poetical Remains of the late Dr. J. Leyden,' and *Essay on the Life of Leyden*, in 'Scott's Miscellaneous Works'.)

LEYDEN, LUCAS VAN, a very celebrated old Dutch painter and engraver, was born at Leyden in 1494. He was first instructed in the arts by Hugh Jacobze, his father; afterwards by Cornelis Engelbrechts; and he distinguished himself even as a boy by his engravings, and was a famous painter as early as his twelfth year. He painted in distemper a picture of St. Hubert, in 1506, for a citizen of Leyden of the name of Lokhorst, who was so astonished and gratified at the excellence of the work, that he paid him twelve gold pieces for it, one for each year of his age; at that time doubtless a very large sum for a picture. Some of Lucas's early engravings are highly prized by print-collectors, and accounted among the greatest rarities of their class; they owe their value however much more to their time and the peculiar circumstances of their origin, than to any intrinsic merit they may have. They are better as engravings than as works of art. Vasari speaks highly of the prints of Lucas d'Ollanda, as he is called by the Italians. He excelled in aerial perspective, but he was far surpassed by his two contemporaries, Albert Dürer and Marcantonio—in correctness of drawing by the latter, and in execution and in drawing by the former. Albert Dürer visited Lucas at Antwerp in 1521, and he makes the following note in his journal: "I was invited to dinner by master Lucas, who engraves in copper: he is a little man, and is a native of Leyden." This visit was paid during a journey which Lucas made through Zealand, Flanders, and Brabant for the sake of becoming acquainted with and seeing the works of their various painters. The entry above quoted from the pocket-book of Albert Dürer, fixes the date of this journey six years earlier than the account of Van Mander, who says that Lucas made it when he was about thirty-three years of age, which, according to his own date of Lucas's birth, 1494, would be in 1527.

Lucas, who was well to do in worldly matters, fitted up a small vessel or sloop expressly for this journey; and at Middelburg, where he entertained the painters of the place with a feast which cost him sixty florins, he persuaded Jan de Mabuse to join him, and they

made the excursion together, both clad more like princes than artists. It was a succession of feasts, and Lucas repeated the entertainment of Middelburg at Ghent, at Antwerp, and at Mechlin. He however was not less energetic in his pleasures than at his work, and he indulged during this excursion in a round of dissipation which appears to have lastingly injured his constitution: he was never well afterwards. His own vanity led him to account for his illness by the supposition that some of his rivals whom he had entertained had endeavoured to poison him, and he added to his malady by indulgence and despondency. He allowed his mind to fall into such a morbid state that his physical strength left him, and he passed nearly the whole of the last few years of his life in bed, or at least in the sick-room, still however working at occasional intervals. He died in 1533, aged only thirty-nine.

Lucas's pictures are very scarce; they are in the old Flemish style, but are among the best works of that school. They are earnest, expressive, deeply coloured, and executed with great care; and are beautiful and highly interesting, notwithstanding their gothic forms and arrangement: in the perspective of colour they are in advance of their time. The galleries of Vienna, Berlin, Dresden, and Munich possess a few good pictures by Lucas; his own portrait is in the Berlin Gallery. There is a very small curious picture by him in the collection of the Duke of Devonshire, at Devonshire House; it represents a man having a tooth drawn, while a woman is picking his pocket: there is a print of it, of the same size, by Lucas himself, dated 1523. There is a picture also by Lucas at Wilton House, and another at the Liverpool Institution. A picture of the 'Last Judgment,' one of his most remarkable works, is still in the town-house at Leyden. The print of 'Eulenspiegel,' a notorious clown or jester of the 14th century, is the rarest engraving in existence: there are said to be not more than five or six of the original extant, but it has often been copied, and the first copy was made in 1644 by Hondius, when the price of the original, even at that early time, was fifty ducats; it is about six and a half inches high and rather more than five wide. Bartsch, who published a distinct catalogue of the prints of Lucas van Leyden, describes 174 engravings by him; in all, including wood-cuts, his prints amount probably to about 200.

(Van Mander, *Het Leven der Schilders*; Bartsch, *Catalogue Raisonné de toutes les Estampes qui forment l'Œuvre de Lucas de Leyde, et Peintre Graveur*, vol. vii.; Huber, *Manuel des Amateurs*, &c.; Von Quandt, *Entwürfe zu einer Geschichte der Kupferstecher-Kunst*; Van Eynden and Van der Willigen, *Geschiedenis der Vaterlandsche Schilderkunst*, &c.)

LIBANIUS, a celebrated teacher of rhetoric, was born at Antioch in Syria, in 314, of an ancient and noble family. After pursuing his studies with great diligence in his native city, he repaired to Athens, where he remained four years. He taught the arts of rhetoric and declamation at Athens, Constantinople, and Nicomedia, in succession; but being obliged to leave these places in consequence of the opposition of rival teachers who envied his superior talents, he returned in 354 to Antioch, where he chiefly resided during the remainder of his life. He was considered the most eminent rhetorician of his age; his school was frequented by numerous pupils, and he numbered among his disciples John Chrysostom and Theodore of Mopsuestia. The Emperor Julian was a great admirer of his works; he imitated his style in his own writings, and after his accession to the empire formed an intimate friendship with the rhetorician, and bestowed upon him the dignity of quaestor. It is related by Eunapius ('De Vit. Philosoph. et Soph.', p. 135) that one of the emperors (probably Theodosius the Great) gave him the honorary rank of præfect of the prætorium, but that it was declined by Libanius as a less illustrious title than that of Sophist. Libanius was alive in the year 390, since he mentions in a letter to Priscus ('Ep.' 866) that he was then seventy-six years of age.

Libanius was a pagan, and many of his works are written in defence of the heathen religion; yet this did not prevent his being on good terms with St. Basil. [BASIL.] There is a curious speech of his still extant addressed to the Emperor Theodosius respecting the heathen temples, which has been translated into English by Dr. Lardner, in the eighth volume of his 'Credibility of the Gospel History.'

Most of the writings of Libanius have come down to us; they are chiefly declamations on the leading events of Greek history, and are characterised by Gibbon as the "vain and idle compositions of an orator who cultivated the science of words; the productions of a recluse student, whose mind, regardless of his contemporaries, was incessantly fixed on the Trojan war and the Athenian commonwealth." His oratorical works and moral treatises were published by Morel, 2 vols. fol., Par., 1606-27. The best edition of his declamations is by Heiske, 4 vols. 8vo, Leip., 1791. The letters of Libanius, which amount to more than 1600, were published by Wolf, fol., Amst., 1738.

* LIBELT, KAROL, a Polish philosophical and political writer, born at Posen in 1806, was educated there and at Berlin, where in the second year of his studies at the university he obtained a prize for a Latin dissertation, 'De Pantheismo.' After receiving his degree of Doctor of Philosophy, he went in 1830 to Paris, and at the close of the same year to Warsaw, where he took a part in the national insurrection; and served during the ensuing war, first as an artilleryman, then as an officer of artillery. At its conclusion he gave his attention for some time to farming in Posen, and it was not till 1840 that he appeared again in literature. He was part editor of a weekly periodical,

the 'Tygodnik Literacki,' resembling the 'Literary Gazette;' then of a quarterly collection of essays entitled 'Rok,' or 'The Year,' which received the contributions of the most distinguished writers in Prussian Poland. In the year 1846 he was implicated in the democratic conspiracy of Microslawski, and, after more than a year's imprisonment, was still awaiting his trial in Berlin when unexpectedly released in 1848 by the March revolution. He was elected a member of the Slavonic Congress which met at Prague, of the Prussian Second Chamber, and of the German Parliament at Frankfurt, all three of which ended in failure. He then established a newspaper at Posen, under the title of 'Dziennik Polski' ('The Polish Journal'), which was suppressed in consequence of the re-action. A collection of his smaller writings, 'Pisma Pomniejsze,' was published at Posen in six volumes, 1849-52. The political ones are written in a moderate tone, and not remarkable for either wideness of view or elevation of sentiment. He speaks, for instance, of the war commenced by the United States against Mexico as offering a favourable opportunity for France to depress England. His philosophical and critical works are of a higher character, and his name is placed with that of Trentkowski at the head of Polish writers on these subjects. One of his works, the 'Dziwica Orleanska,' or 'Maid of Orleans,' was composed when in prison at Berlin.

LIBERI, PIETRO, Cavaliere, was a celebrated painter of Padua, where he was born in 1605. He was the pupil of Padovanino, and is considered by some the best draftsman of the Venetian school of painters. He studied in Rome, at Parma, and in Venice, and his works are not distinguished by the peculiar characteristics of any particular school, but are equally conspicuous to a certain degree for the qualities of all. There are several great works by him, as the 'Slaughter of the Innocents,' at Venice; 'Noah leaving the Ark,' at Vicenza; and the 'Deluge,' at Bergamo: he executed also many works in Germany. He was very fond of painting the nude, and particularly naked Venuses, which from their character acquired him the name of Libertino. Liberi had two manners; at one time he was bold and careless, and at another minute and laborious. This variety he explained to be intentional: he said that for the expert and intelligent he painted freely, but for the ignorant he finished highly. He died in 1687. (Zanetti, *Della Pittura Venesiana*; Lanzi, *Storia Pittorica*, &c.)

LIBERIUS was elected to succeed Julius I. in the see of Rome in 353. The Semi-Arians, countenanced by the Emperor Constantius, had then the ascendancy; and both the council of Arles (353), and that of Milan (355), condemned Athanasius, bishop of Alexandria. As Liberius, together with some other western bishops, refused to subscribe to this condemnation, he was arrested by order of the emperor, and taken to Milan, where he held a conference with Constantius. The questions and answers in this conference are still extant in Constant's 'Epistole Romanorum Pontificum.' The conference terminated in a sentence from the emperor deposing Liberius from his office, and banishing him to Beroa in Macedonia. The emperor caused Felix, a deacon at Rome, to be consecrated bishop. A petition was presented to the emperor by the principal ladies of Rome in favour of Liberius, but it was not till 358 that Liberius was restored to his see, and not without having first approved in several letters of the deposition of Athanasius, and subscribed to the confession of faith drawn up by the court party at the council of Sirmium. The weakness of Liberius had a mischievous influence upon many of the Italian bishops, and the council of Rimini openly countenanced Arianism; but it is not true, as asserted by some, that Liberius subscribed the Rimini confession of faith. He ended his career in orthodoxy, and died in 366. He was succeeded by Damasus I. Liberius is said to have built the Basilica on the Esquiline Mount, which has been called Liberiana, from his name, and is now known by the name of Santa Maria Maggiore.

LICHTENBERG, GEORGE CHRISTOPHER, deserves a place in every English biographical work, if only on account of his admirable 'Erklärung der Hogarthischen Kupferstiche,' wherein he has entered far more completely into the spirit of our great artist's works, than any of his English illustrators and commentators, scarcely excepting Charles Lamb, whose 'Essay on Hogarth' is besides a mere sketch in comparison with the extensive canvases filled up by the German. Had he written nothing else of a humorous nature, this production would have established Lichtenberg's reputation for searching keenness of wit, comic power, and for both playful and severe satire. Unfortunately however he did not live to complete his work.

Lichtenberg was born at Ober-Ramstadt, near Darmstadt, July 1st, 1742, and was his parents' eighteenth child. By his father, who was the pastor of the place, he was early initiated into mathematical and physical studies, in which he afterwards greatly distinguished himself. On the death of his father he pursued his studies, first at Darmstadt, afterwards at Göttingen, at which university he was appointed to a professorship in 1770. Although then only in his twenty-seventh year, he was well qualified for the office bestowed on him, such having been his assiduity that there was scarcely any branch of learning or science with which he was unacquainted. Just before his promotion he had made a visit to England, where he had the honour of being introduced to George III., and was noticed by the leading men of science in that day. The favourable reception he had met with induced him to pay a second visit to this country in 1774, preparatory to which he had

made himself thoroughly master of our language. During this second residence among us, which was of some continuance, he was admitted into the highest literary circles. He also studied our national character with that shrewdness peculiar to him, and laid in that stock of information which he afterwards turned to such excellent account in his work on Hogarth.

From the period of his return to that of his death he resided constantly at Göttingen, devoted entirely to the duties of his professorship, to his pen and his studies. He latterly became subject to attacks of hypochondria, which induced him to lead the life of a recluse, without other society than that of an excellent wife and his five children. This malady however did not interrupt his studies, to which he continued as attached as ever, neither did it prevent his carrying on a very extensive epistolary correspondence almost to the day of his death, February 24th, 1799.

Besides the already-mentioned commentary on Hogarth (of which some specimens appeared several years ago in the 'London Magazine,' and from which there are also some extracts in the article entitled 'Lichtenberg and Hogarth,' 'Foreign Quarterly,' No. 32), his other works are exceedingly numerous, and no less varied; for while some are entirely scientific, on subjects of astronomy and physics, others are pieces of wit and satire, frequently of the most pungent kind, and occasionally of the most extravagant and whimsical cast. Among these productions of humour the titles of one or two may be mentioned as conveying some idea of their subjects, namely, 'The Mad-house for Opinions and Inventions;' 'A Sentimental Journey to Laputa;' 'Consolation for those Unfortunates who are no Original Geniuses;' 'A Patriotic Contribution to the Study of German *Methology* (Drunk-ness);' and the 'Bedlamites' Petition.'

LICHTWER, MAGNUS GOTTFREID, born at Wurzen, in Saxony, January 30th, 1719, though only one of the minor poets of Germany, may be considered almost the first in the rank of its fabulists. When only two years old he lost his father, but his mother's circumstances enabled her to bestow upon him a good education. At her death, in 1737, the further charge of his studies devolved upon his guardian, the *Stiftarath* Zahn, by whom he was sent to Leipzig, where he applied himself more particularly to jurisprudence, but also made himself master of French and Italian. In 1741 he went to Dresden, in the hope of there obtaining some office or appointment, but after fruitlessly waiting two years, quitted it for Wittenberg, where he obtained the degree of Doctor of Laws, and delivered lectures in jurisprudence, until the breaking of a bloodvessel compelled him to abstain from the exertion of speaking in public. He now took up his pen and produced his 'Fables,' the first edition of which appeared anonymously in 1748. The following year he quitted Wittenberg, and went to Halberstadt, where his mother's brother was one of the dignitaries of the cathedral. This change proved highly advantageous to him, being the means of his obtaining some important charges. In 1758 he published a new edition of his 'Fables,' with his name prefixed to it, and also his didactic poem 'Das Recht der Vernunft;' and in 1762 a 'Translation of Minutius Felix,' with notes. He died July 7th, 1783. The poem above mentioned is by no means equal to many others of the same class in the language: it is an exposition of Wolf's philosophy, formally treated, instead of the dryness of the subject being at all relieved or adorned by poetical illustration of the doctrine. His 'Fables,' on the contrary, are master-pieces; many of them strikingly original in subject, terse and pointed in style, and admirable in their moral.

LICINIUS FLAVIUS VALERIUS, Emperor of the East, by birth a Dacian peasant, but becoming the companion in arms and friend of the Emperor Galerius, was raised by him, in November, 307 A.D., on the death of Severus, to the rank of Augustus, with the command of the Illyrian provinces, although he had not passed through the subordinate grade of Cæsar. Licinius, wholly uneducated, remorselessly cruel, was without any redeeming quality except that of courage. The events of his career are sufficiently noticed under CONSTANTINUS, DIOCLETIANUS, and MAXIMINUS. By the death of Maximinus, whom he totally defeated in 313, Licinius became undisputed emperor of the East, Constantine in like manner reigning over the West. War broke out between the two emperors in 315, but after sustaining a series of reverses Licinius obtained peace by the cession of the whole of Greece and Macedonia, and the lower valley of the Danube. The peace lasted till 323, when a fresh war ensued, but was soon brought to a close by the decisive victory of Chalcidæus (September 323). Licinius was at first merely banished to Thessalonica, but was soon after (324) put to death by command of Constantine. [CONSTANTINUS.]

LICINIUS STOLO. Caius Licinius Calvus Stolo, of a distinguished plebeian family at Rome, was made tribune of the people, together with his friend L. Sextius Lateranus, in the year B.C. 375. These tribunes brought forward three 'rogations,' that is to say, bills or projects of law, for the comitia or assembly of the tribes to decide upon:—1. That in future no more military tribunes should be appointed, but two annual consuls as formerly, and that one of the two should always be a plebeian. The occasional appointment of military tribunes, part of whom might be chosen from among the plebeians, was a device of the senate to prevent the plebeians from obtaining access to the consulship. 2. To deduct from the capital of all existing debts from one citizen to another the sums which had been paid by the debtor as interest, and the remaining principal to be

discharged in three years by three equal payments. This seems, according to our modern notions of money transactions, a very summary and not very honest way of settling standing engagements; but if we carry ourselves back to that remote period of Roman society, and take into consideration the enormous rate of interest demanded, the necessities of the poorer citizens, who were called from their homes and fields to fight the battles of their country, and had no means of supporting their families in the mean time except the ruinous one of borrowing money from the wealthy, who were mostly patricians, and also the fearful power which the law gave to the creditor over the body of his debtor, and the atrocious manner in which that power was used, or rather abused, in many instances, such as those reported by Livy (ii. 23; vi. 14; viii. 28), we shall judge with more lenity of the proposition of Licinius. The third rogation has been a subject of much perplexity to modern inquirers. Its object, as briefly expressed by Livy, was that "no one should possess (*possideret*) more than five hundred jugera (about 333 acres) of land," and until lately it has been literally understood by most readers of Roman history as fixing a maximum to private property. But Beaufort, and more lately Heyne, Niebuhr, and Savigny, have shown that the limitation referred to the holding of land belonging to the *ager publicus*, or public domain of the state; and when we reflect upon the insignificant extent of the original territory of Rome, and that it became gradually enlarged by the plunder or appropriation of a part of the land of the neighbouring nations, it appears evident that most of the large estates possessed by the patricians must have been portions of this conquered land, which was considered as public property, but which individuals of the influential class in the state occupied, cultivated, and held as tenants at will, they and their descendants paying to the state a tenth of all grain, a fifth on the produce of plantations and vineyards, and a certain tax per head of cattle grazing on the public pasture. This was the kind of *possession* which the Licinian rogation purposed to limit and regulate. Licinius proposed that all those who had more than 500 jugera should be made to give up the surplus, which was to be distributed among those who had no property, and that in future every citizen was to be entitled to a share of newly conquered land, with the same restriction and subject to the same duties. This might be considered as a bill for the better distribution of plunder among those engaged in a plundering expedition, for the land thus acquired and distributed cannot be compared to real property as held throughout Europe in our days; and this reflection may perhaps serve to moderate somewhat the warmth of our sympathy in reading of the complaints of the Roman plebeians concerning the unequal distribution of land which had been taken by violence from a third party, the other nations of Italy, who were the real sufferers.

The patricians, who had had till then the largest share of the common plunder, opposed the utmost resistance to the passing of these three laws. They gained over to their side the other tribunes, who put their veto on the bills. But at the end of that year Licinius and Sextius put their own veto on the election of the new military tribunes, and being themselves re-elected by the tribes every year, they renewed for five years the same opposition to the election of the curule magistrates, so that the republic fell into a kind of anarchy. In the fifth year, B.C. 370, the inhabitants of Velitræ, a Roman colony, revolted, made incursions into the Roman territory, and besieged Tusculum, the ally of Rome. Licinius and Sextius now waived their opposition, the comitia were held, and six military tribunes were elected, and, as the war continued, six more were appointed in the following year, Licinius and Sextius meantime continuing to be re-elected every year as tribunes of the people. Having gained over to their side three more of their colleagues, they again brought forward their bills, asking the senators "how they could pretend to retain more than 500 jugera of land, while a plebeian was only allowed two jugera, hardly enough to build himself a cabin upon, and to supply him with a burial-place when he died." These expressions of Livy's text confirm Niebuhr's opinion that the whole question was about the *ager publicus*, or conquered land, of which the plebeians who had served in the army received small allotments of two or more, but never more than seven jugera (between four and five acres) each. Licinius then went on to ask the patricians, who still opposed his other bill concerning the debtors, "whether they delighted in having their houses full of plebeians in fetters, so that wherever a patrician dwelt there must be a private dungeon also?" And then turning to the plebeians, he told them that the surest remedy for such evils was contained in his third bill, namely, that they should always have one of the two consuls chosen from their own body. However, all proceedings concerning these laws were again suspended for that year, the five tribunes of the people who were still in the interest of the senate urging that it was proper to wait for the return of the army, which was still in the field against Velitræ. Six new military tribunes were elected for the following year, B.C. 368. At the same time Licinius and Sextius, being re-elected tribunes of the people for the eighth time, resolved to bring their bills before the tribes, without any regard to the intercession or veto of their colleagues.

The senate, seeing the final struggle approaching, had recourse to a last expedient: they appointed Camillus to the dictatorship. While Licinius and Sextius, having convened the tribes, sure of the people's favour and regardless of the veto of their colleagues, were proceeding

to take the suffrages, and the first tribes had already voted for the bills, the dictator, attended by a great body of the patricians, repaired to the place of assembly, and declared that he was come to support the rights of one part of the tribes to put their veto on the proceedings of the others; and as Licinius and Sextius paid no attention to him, Camillus ordered the lictors to disperse the assembly, threatening, in case of noncompliance, to summon the people to the Campus Martius, to enlist and march into the field. This put a stop to the voting. Licinius and Sextius then preferred a bill that M. Furius Camillus should be fined 500,000 Asses, to be sued for as soon as he laid down his office, for interrupting the tribes in their right of legislating. Camillus now bent before the storm and abdicated his office. It appears that Licinius and Sextius, having assembled the tribes anew, might have passed the two bills concerning the land and the debtors, but that the people demurred to the law concerning the consulship, in which most of them felt little interest. The two tribunes however refused to separate the three bills, telling the people that they must either have all or none; and they added, that unless they agreed to pass the three bills, they, the two tribunes, were determined to serve them no longer in their office after that year. They consented however to be re-elected, and soon after obtained the passing of another bill, by which the custody of the Sibylline books, instead of being entrusted to two patricians as heretofore, should be entrusted to decemviri, half of whom were to be always plebeians. They then suffered six patricians to be elected military tribunes for the following year, B.C. 366. In that year, the Gauls having again advanced towards Rome, Camillus, now nearly eighty years of age, was appointed dictator for the fifth time, and marching out of Rome completely defeated the barbarians. On his return he obtained a triumph, with the consent of both senate and plebs. Livy (b. vi. 41) here becomes extremely laconic, merely saying that the external war being concluded, the internal contest raged more violently than ever, and that after a desperate struggle the dictator and senate were defeated, and the three rogations or bills of the tribunes were allowed to pass. Plutarch, in the life of Camillus, gives some further particulars of a great tumult in the Forum, when Camillus was nearly pulled down from his seat; but being protected by the patricians he withdrew to the senate-house; and before entering it, turned towards the capitol and besought the gods to put an end to these commotions, vowing to build a temple to Concord if domestic peace could be restored; and it appears that it was he who persuaded the senate to comply with the wishes of the plebs. Thus the three Licinian rogations passed into law after a struggle of ten years, which is remarkable for the orderly and legal manner in which it was carried on, and for the temper and judgment shown by the two popular tribunes.

Sextius Lateranus, the colleague of Licinius, the first plebeian consul, was chosen for the next year, 365 B.C., together with a patrician, L. Æmilius Mamercinus. The senate however refused to confirm the election of Sextius, and the plebeians were preparing for a new secession and other fearful threatenings of a civil war, when Camillus again interposed, and an arrangement was made that while the patricians conceded the consulship to the plebeians, the latter should leave to the patricians the prætorship, or office of supreme judge in the city of Rome, which was then for the first time separated from the consulship. Thus was peace restored.

Licinius, the great mover of this change in the Roman constitution, was raised to the consulship B.C. 363, and again in the year B.C. 360, but nothing remarkable is recorded of him while in that office. In the year B.C. 356, under the consulship of C. Marcius Rutilus and C. Manlius Imperator, we find Licinius charged and convicted before the prætor of a breach of his own agrarian law, and fined 10,000 Asses. It seems that he possessed 1000 jugera, one-half of which he held in the name of his son, whom he had emancipated for the purpose. After this we hear no more of C. Licinius Stolo.

(Livy, vi. and vii.; Niebuhr, *Römische Geschichte*, vol. iii.; Val. Maximus, viii. 6; and Savigny's remark, *Das Recht des Besitzes*, p. 175, on his blunder about the story of Licinius violating his own law.)

* LIEBIG, JUSTUS BARON VON, a distinguished living chemist. One of the most prominent features in the history of the science of the 19th century has been the rapid progress of organic chemistry. Although the initiative of this remarkable period cannot be given to any one chemist more than another, the name of Liebig must ever be most intimately associated with this brilliant passage in the history of modern science. Very early in the progress of his investigations his attention was directed to those compounds which throw light on the mysterious processes which give life to plants and animals. His subsequent position at the head of a national laboratory, with competent assistants to repeat the experiments of others, and make those suggested by himself, gave him an opportunity of generalising that few other chemists possessed, and which resulted in those works on vegetable and animal chemistry which astonished the world by giving an explanation of processes which had hitherto been deemed beyond the reach of science.

Justus Liebig was born at Darmstadt on the 8th of May 1803. He received his early education in the gymnasium of his native town. His love of natural science induced his father to place him in an apothecary's establishment, where he got the first insight into that science of which he has become so distinguished an ornament. Here

he remained ten months, and was afterwards transferred to the University of Bonn in 1819. He subsequently studied at Erlangen, and took his degree of Doctor of Medicine. In 1822 he obtained a stipend from the Grand Duke of Hesse Darmstadt, which enabled him to visit Paris, where he remained for two years. Here he studied with Mitscherlich, the distinguished professor of chemistry at Berlin. During his residence in Paris he devoted himself to the science of chemistry. His attention at this time was especially directed to the composition and nature of those dangerous compounds known by the name of Fulminates. These bodies are composed of an acid consisting of carbon, nitrogen, hydrogen, and oxygen, combined with a base. The salts thus formed are so easily decomposed that a slight touch causes their decomposition; a violent explosion follows, and a new series of compounds are formed. It was the nature of these compounds that Liebig investigated—thus indicating the bent of his genius towards the investigation of the chemistry of those four elements, which, on account of their universal presence in plants and animals, have been called 'organic.' In his subsequent writings he often alludes to the fulminates as instances of unstable chemical combination, illustrating the nature of some of the changes which the organic elements undergo in the compounds which form the tissues of plants and animals. Although the existence of these compounds had been discovered by our countryman Howard in 1800, yet their true chemical constitution was not explained till the youthful Liebig read his paper on them before the Institute of France in the year 1824. The subject of the fulminates has since frequently occupied his attention.

The reading his paper at the Institute of France brought Liebig in contact with Baron Humboldt, who was at that time residing in Paris. At the moment he was unknown to Liebig, and on hearing his paper read he invited him to his house. Liebig unfortunately forgot to ask his name and address, and not till a subsequent occasion did he learn the name of his great friend, who from that time interested himself warmly in his success. Humboldt introduced him to Gay-Lussac and the circle of French chemists, and afterwards used his influence to obtain for him the post of extraordinary professor of chemistry at Giessen. At the early age of twenty-one Liebig entered upon his new duties at Giessen. In 1826 he was appointed ordinary professor in the university. It was now that he commenced the establishment of a laboratory for the teaching of practical chemistry. This was the first institution of the kind that was established in Germany, and soon, under the influence of the ardour and genius of its youthful superintendent, succeeded in attracting the attention of the chemists of Europe. It was in this laboratory that not only Liebig himself worked, but his assistants, Hofmann, Will, and Fresenius, who, by their researches, have obtained a name only second to their master. The system of instruction pursued here has since become the model of a large number of similar institutions all over Europe. The Royal College of Chemistry in London, which is now attached to the Government School of Mines, resulted from the success of the Giessen laboratory, and Dr. Hofmann, Liebig's able assistant, was placed at the head of it. The laboratory of Giessen was the resort of students from all parts of the world, and many of our British chemists, as Lyon Playfair, Johnston, Gregory, and others, were students there.

In 1832 Liebig, in conjunction with his colleague Wöhler, commenced editing the 'Annalen der Pharmacie.' This work, which has been regularly brought out from the time of its first appearance till the present, comprises papers on all subjects connected with pharmacy, and it contains a large number of papers by Liebig himself. Latterly, Liebig has only taken a secondary part in editing this work, and Professor Puffendorf has been associated with Professor Wöhler and himself.

In the autumn of 1838 Liebig visited England, and was present at the meeting of the British Association for the Advancement of Science, which was that year held for the first time at Liverpool. At this meeting he read a paper on the composition and chemical relations of lithic acid. In this paper he announced Wöhler's great discovery of the composition of urea, and the method of making it artificially. With the exception of oxalic and hydrocyanic acids, which are much simpler substances, this was the first time that the chemist had succeeded in forming out of the living body an organic compound. Liebig's paper on lithic acid showed how highly he estimated Wöhler's discovery, and which led him to anticipate the time when other organic substances would be formed, and the chemistry of life be eventually solved. On the associated men of science at this meeting Liebig's presence made a deep impression, and it was with the sanction of the whole meeting that he was requested to draw up two reports, one 'On Isomeric Bodies,' the other 'On Organic Chemistry.' To these reports the young chemists of this country looked forward with anxiety. It is true that organic chemistry had at least one laborious representative in this country in Prout, but nothing had been done even in our medical schools to form a school of organic chemistry. It was known that Liebig had worked laboriously at almost every department of organic chemistry, but a knowledge of the progress of this science on the Continent was confined to only a few. The next meeting of the British Association was held at Birmingham, but no report appeared from Liebig. It was between this meeting and that of Glasgow, which was held in 1840, that Liebig brought out the work entitled, 'Chemistry in its Application to Agriculture and Physiology.'

It was translated into English from the manuscript of the author by Dr. Lyon Playfair, and dedicated to the British Association for the Advancement of Science. It is difficult to say how much of this work was really original matter. The whole was however worked out with the hand of a master. His own original investigations on a great variety of subjects, with those of Mulder on the nature and relations of the nitrogenous products of plants, were arranged in the form of a theory of vegetable life, which, however it might have been apprehended by some in parts, now appeared for the first time as a consistent whole. In his dedication the author says that in this work he has "endeavoured to develop in a manner correspondent to the present state of science, the fundamental principles of chemistry in general, and the laws of organic chemistry in particular, in their application to agriculture and physiology; to the causes of fermentation, decay, and putrefaction; to vinous and acetous fermentation, and to nitrification. The conversion of woody fibre into wood and mineral coal, the nature of poisons, contagions, and miasms, and the causes of their action on the living organism, have been elucidated in their chemical relations." Perhaps one of the most original portions of the book is that devoted to the consideration of the action of poisons on the system, in which he endeavours to show that poisons act injuriously on the system,—first, by causing definite chemical compounds with the substances forming the flesh of the body poisoned, and thus rendering life impossible, as in the case of arsenic and corrosive sublimate;—and secondly, by inducing chemical changes by contact, as is seen in many cases of inorganic bodies, in fermentation, putrefaction, and emerecausis or decay in organic bodies. In this way he explains the origin of the various forms of contagious disease by the introduction into the system of a substance capable of communicating to the solids and fluids of the body the same state of change in which it is in itself. This subject was brought by Dr. Lyon Playfair before the Glasgow meeting of the British Association in 1840.

It was not to be expected that a work like this should at once be adopted without opposition, or a thorough canvas of the conclusions at which the author had arrived. From the very extent and nature of the subject, the author was obliged to accept and adopt the conclusions of physiologists who had not been so accurate in their investigations as himself. In subsequent editions of this work he has however availed himself of all the information brought to bear on his subject by his critics, and has shown most conclusively that the only prospect for the advancement of agriculture as an art is through a thorough study of the physiology of plants. The effects of this work soon became apparent, more especially in this country, in the regard that was paid to chemical principles in the application of manures. That many errors were committed, that Liebig himself turned out to be wrong in some of his conclusions, was only what could be expected. The application of chemistry to agriculture has however steadily advanced, numerous treatises devoted to this subject have appeared, and certain great advantages have been obtained. As an instance of the latter, the extensive application of phosphate of lime in the form of bones, coprolites, and other compounds, when treated by sulphuric acid, may be quoted.

One of the most recent of Liebig's contributions to agricultural chemistry is his work entitled 'Principles of Agricultural Chemistry, with Special References to the late Researches made in England.' This work was translated by Professor Gregory of Edinburgh, and published in London in 1855. It was written in answer to the conclusions arrived at from a long course of experiments by Mr. J. B. Lawes of Berkhamstead. These conclusions were in direct contradiction to the principles previously laid down by the author, and he states, "In fact all the experiments of Mr. Lawes prove exactly the reverse of that which, in his opinion, they ought to demonstrate." Of this work the translator says, "It is, so far as I can judge, by far the best of the author's writings on the important subject to which it refers." This work contains, in the shape of fifty propositions, a summary of the true relation between chemistry and agriculture, and may be regarded as the most matured of the author's works on this important department of chemical inquiry. This controversy appears to have been conducted on both sides with the most perfect temper and good feeling.

Such works alone as the above might well have made a lasting and enviable reputation; but from 1840 to 1855 Liebig was engaged in the production of many other works. In 1837 he commenced with Wöhler a 'Dictionary of Chemistry,' which was published in parts. In 1839 Geiger's 'Handbook of Pharmaceutical Chemistry' was published, in which the part devoted to Organic Chemistry was written by Liebig: this part afterwards appeared as a separate work. In 1841 he edited the organic part of the late Dr. Turner's 'Elements of Chemistry.'

The volume on Agricultural Chemistry was regarded by the author as only an instalment of what he owed the British Association in answer to their request for a report on the progress of Organic Chemistry. At the meeting held at Manchester in June 1842, Dr. Lyon Playfair read an abstract of Professor Liebig's report on 'Organic Chemistry applied to Physiology and Pathology.' This able production was published in the 'Transactions' of the association. The entire report appeared in 1842, under the title of 'Animal Chemistry, or Chemistry in its application to Physiology and Pathology,' 8vo,

London. This work was translated from the author's manuscript by Professor Gregory of Edinburgh; a third and greatly improved edition was published in 1846. This work carried his chemical researches from the vegetable to the animal kingdom. What had been done for the plant, vegetable physiology, and the agriculturist in the first work, was now attempted to be done for the animal, animal physiology, and the medical practitioner. In this work he pursued the same plan as in the first: he set aside the hypothesis of a vital principle as a cause in living phenomena, and examined them from a physical and chemical point of view. A strict comparison is instituted between that which is taken into the body in the form of air and food with that which passes out of the body, and all possible knowledge of the laws of organic chemistry is brought to bear upon the intermediate phenomena of life. In this way he threw a flood of light on processes that had hitherto been wrapped in obscurity. The phenomenon of animal heat was seen to be more clearly the result of the oxidation of carbon. Certain kinds of food, as starch, sugar, and oil, were pointed out as the sources of the carbon, whilst Mulder's group of proteinaceous compounds were as clearly traced to their destiny in the production of the living tissues. The source of fat in the animal body, in spite of the opposition of the French school, was traced to the oxidation of the hydrogen in the starch and sugar of the food. The nature of the excretions, especially of the urine, bile, and feces, were carefully examined, and manifold new analyses and results were given. The impression this work has made on the science of physiology and the practice of medicine is not less than that of the last on botany and agriculture. It at once called into activity an amount of chemical investigation that has already led to the most important results, and given a new aspect to all physiological inquiry in the animal kingdom. Whilst the microscope on the one hand has gone on developing new structures, the chemist has demonstrated that these structures exhibit life but in obedience to chemical laws. Numerous treatises have been written on the chemistry of animal life, and all bear more or less the impress of the genius of Liebig.

If the first work excited controversy, it could hardly fail to be produced by the second. Mulder accused Liebig of appropriating his discoveries without acknowledgment, especially his great discovery of protein. To this question Liebig, who, in the meantime had some doubts with regard to the real nature of this substance, replied "Will Mulder say what is protein?" Whether this substance exists or not, the discovery is undoubtedly due to Mulder of the identity in animals and plants of the substances known as fibrine, albumen, and caseine, and that the animal is dependent on the vegetable kingdom for its supply of them, in one form or the other. The importance of this discovery can hardly be overrated, whether protein lies at the foundation of those nitrogenous matters or not. Many of Liebig's physiological views have met with very decided opposition, and many of his opinions have been shown to be incorrect. But his great glory will always be the method he pursued. By this method he has put the physiologist in the right direction to attain the great aim and ends of his science. These views are of the highest interest for mankind, as they involve no less questions than the very existence of man, and the best possible means of enjoying that existence.

However complete the first outlines of his theories might appear to be, Liebig never ceased working at correcting and perfecting them. Between the period of the publication of the editions of his works on Agricultural and Animal Chemistry, his 'Annalen' and the continental journals teem with his papers on various points which had been canvassed in his books; and in all directions, in his own laboratory and in other places, we find men working under his advice and direction. It was thus that, from the time the subject of food occupied his attention at all, he prosecuted new researches on the nature of the food, and of those changes in the animal body by which it becomes the source of life, and ultimately the material rejected from the system. In 1849 another work was prepared for the English press, and translated by Dr. Gregory. This was entitled 'Researches on the Chemistry of Food.' In this work he gave an account of his experiments on the changes which the tissues of the body undergo, and which result in the conversion of fibrine and albumen into gelatine, and eventually urea. In these experiments he operated on large quantities of animal flesh, and succeeded in demonstrating the universal presence of kreatine, a compound first described by Chevreul, also of kreatinine, lactic acid, phosphoric acid, and inosinic acid, in the flesh of animals. In this work he also drew attention to the existence of phosphate of soda in the blood, and its power of absorbing carbonic acid, as having an interesting relation with the function of respiration. He has also shown in this work that the proper cooking of food can only be carried on upon fixed chemical laws, and that much improvement in the economical and sanitary relations of this art may be expected from a larger knowledge of the changes undergone by food in its preparation.

In all his labours Liebig has ever striven to avoid being one-sided. No one seems to have felt from time to time more acutely than himself the fact that, after all, the organic body is not an apparatus of glass tubes and porcelain dishes. He ever tried to penetrate into the nature of those properties and laws which, acting upon the textures of the human body, seemed to interfere with an anticipated necessary chemical result. It is in this spirit that we find him prosecuting

researches upon the physical properties of the tissues, and inquiring into the nature of those laws of the diffusion of matter which had been known under the name of endosmose and exosmose. The results of his researches and inquiries on this subject were again communicated to the English public through Professor Gregory, who translated the work on 'The Motions of the Juices in the Animal Body,' which was published in 1848.

In Giessen Liebig was surrounded by industrious colleagues, who appreciated the value of his researches, and were ready in any manner to act under his direction for the advancement of the sciences they had at heart. It was in 1848 that Liebig proposed to his colleagues to draw up an annual report on the progress of chemistry. Professor Kopp was associated with Liebig in editing the work, whilst Professors Buff, Dieffenbach, Ettling, Knapp, Will, and Lammur were named as contributors. This work has appeared annually, and is a rich depository of chemical information. It was hoped that an English translation would be sufficiently appreciated to have a remunerative sale, and the first four volumes were translated into English by Dr. Hofmann, M. Warren De la Rue, and Dr. Bence Jones, but it does not appear to have been continued for more than four years. One of the last works of Professor Liebig to which we think it necessary to allude, is his 'Familiar Letters on Chemistry.' This volume consists of letters on various subjects connected with chemistry, which are intended to show the importance of the study of chemistry as a general branch of education. Some of them were first published in Germany, and others appeared at intervals as a first and second series translated into English and edited by Dr. Gardner. They have gone through several editions, the last of which in one volume with considerable additions was published in 1851. This is gracefully dedicated to Sir James Clark, Bart., who has taken so much interest in the foundation and development of the Royal College of Chemistry. This work is charmingly written, and indicates one of the sources of Liebig's influence on the public mind. Few men write more clearly or exhibit a more genuine enthusiasm in the importance and value of his science than Professor Liebig. These letters have carried chemistry and its results into localities where it would be impossible it should be found if treated in a dry and technical manner. The subjects on which he writes are those with which all are most familiar, and he clearly demonstrates that there is no one so humble in life, none so exalted in station, none so occupied, that a knowledge of the principles of chemistry may not be of the greatest possible advantage.

Such a man as Liebig was likely to receive honour. The Grand-Duke of Hesse made him an hereditary Baron in 1845. He was made a fellow of the Royal Society of London in 1840. He has been invited to fill chairs of chemistry in England, and also on the continent of Europe, especially that of Heidelberg. All these he refused. In 1852 however he was induced to accept the Professorship of Chemistry at Munich, with the position of President of the Chemical Laboratory. He has been elected foreign fellow of most of the scientific societies of Europe and America that recognise chemistry. In 1854 a subscription was raised in Europe for the purpose of presenting him with some mark of the high esteem in which his labours were held. This subscription realized a sum above 1000*l.* A part of it was spent in purchasing five handsome pieces of plate. This number was selected in order that one piece may be handed down to each of the five children of the baron, should they survive their father. The remaining portion of the money, 460*l.*, was presented him in the form of a cheque.

The Baron von Liebig has formed the most intimate associations in England, and often visits this country. He was present at the meeting of the British Association held in York in 1843, and again at the meeting held at Glasgow in 1855.

LIGHTFOOT, JOHN, born 1602, is one of those English divines who belong peculiarly to the class called commentators, that is, who have written notes or comments on the Holy Scriptures. By the mass of readers these persons are not properly distinguished from each other; yet each has his own peculiarity: that of Dr. Lightfoot being an intimate acquaintance with Rabbinical literature. In this perhaps no English scholar has ever equalled him, and he has applied this species of knowledge extensively, and in many instances successfully, to the illustration of the sacred writings. His works are collected in two large folio volumes, with an account of his life prefixed, to which we refer the reader for particular details. He was the son of a clergyman at Uttoxeter in Staffordshire, studied at Cambridge for the church, was ordained, and settled early in life on the living of Stone in his native county. But the temptation of an easy access to books brought him to London; and taking a house at Hornsey, he there spent twelve years in close theological study. There it was that he laid the foundation of his own fame, and of a usefulness which reaches into a period far beyond the date of his own existence.

In the disturbed times he took part with the Presbyterians, became a member of the assembly of divines, accepted the living of St. Bartholomew beside the Exchange, and was made master of Catherine Hall by the parliamentary visitors of the University of Cambridge. He had also the living of Great Munden in Hertfordshire, which was presented to him in 1644. On the restoration of King Charles II.,

when the Church of England was resettled in an episcopal form and order, Dr. Lightfoot complied with the terms of the Act of Uniformity. From that time he chiefly resided on his living at Great Munden, where he had a people who could not estimate his learning and value, but to whom he was very strongly attached. He used, when absent, to say, that he longed to be among his "russet coats" at Munden. He died in 1675.

LIGOZZI, JA'COPO, a distinguished Italian painter in fresco and in oil, was born at Verona, in 1543, and studied under Paolo Veronese. He established himself at Florence, where he had much influence upon the painters of his time, especially in colouring; for though not equal to Paolo Veronese, Ligozzi was an effective and powerful colourist, and at the same time that he added vigour to the colouring of the Florentines, he improved his own drawing. The Grand-Duke Ferdinand II. appointed Ligozzi his principal painter, and superintendent of the Imperial Gallery. He died in 1627.

Ligozzi is the painter of several great works in oil, though they are what the Italians call quadri di macchina, or machines, that is, ornamental or decorative works, distinguished chiefly for their size and effect on the eye. The following works however are of a superior order of this class—'San Raimondo resuscitating an infant,' in Santa Maria Novella; the four crowned Saints—SS. quattro Coronati—at Gli Scalzi, or the barefooted friars, at Imola; and the 'Martyrdom of Santa Dorothea,' at the Conventual Friars, at Pescia. Ligozzi executed also many small highly finished easel pictures. Agostino Caracci engraved some of his works.

LILLO, GEORGE, was born in 1693, and carried on the trade of a jeweller near Moorgate in London. Though educated in the strict principles of the Protestant Dissenters, he produced seven dramas, three of which are printed in every collection of acting plays. He died in 1739.

In the three plays, 'George Barnwell,' 'Arden of Feversham,' and 'Fatal Curiosity,' the author evidently has but one purpose in view, to exhibit the progress from smaller to greater crimes. Thus the impure passion of Barnwell, the ill-suppressed attachment of Arden's wife for the lover of her youth, and the impatience under poverty of the Wilmots (in 'Fatal Curiosity'), are the three beginnings of vice, all of which terminate in murder. Not only is the purpose of these plays the same, but the same measures are adopted in all for its attainment. In all there is a tempter and a tempted; the first determined in vice, the latter rather weak than intrinsically vicious: thus Barnwell is led on by Milwood; Arden's wife by her paramour Mosly; and Wilmot by his wife Agnes. Now Lillo having an eminently tragic idea, and one only, it might easily be inferred that he could write one and only one good drama; and this was actually the case. His 'Fatal Curiosity' stands as a masterpiece of simple dramatic construction, and the catastrophe is eminently appalling and tragic. The following is the subject: A man and his wife, who have formerly been wealthy, but are now sunk to a deplorable state of poverty, receive a stranger who asks for a lodging. Finding that he has wealth about him, they murder him, and afterwards discover that he is their own son, who has been absent many years, and who has concealed his name that he may give his parents a joyful surprise. This simple story is arranged with consummate art, being scarcely inferior in construction to the 'Edipus Tyrannus' of Sophocles, with which Harris, in his 'Philological Enquiries,' has compared it. He observes that in both, the means apparently tending to happiness (namely, Edipus sending to the oracle, and Wilmot's son returning) in reality produce misery. The language however is by no means equal to the construction, but is often inflated, and disfigured by conventional similes and expressions, which destroy every possibility of enunciating true feeling: characters under the most acute mental agonies seem, strangely enough, to be building elaborate and affected phrases. Still there are passages and touches in the 'Fatal Curiosity' which show that, had it not been for a defect in taste, Lillo could have taken a high position by this one drama, and revealed many secrets of the human heart. With respect to his other two plays, though the construction of 'George Barnwell' is skilful, and the situation in the fifth act of 'Arden' most powerful, they stand at an immeasurable distance below 'Fatal Curiosity.' There are several anecdotes relative to the effect produced by 'George Barnwell' on young men who have pursued vicious courses and have been reclaimed by this tragedy. It was once usually acted at some of the theatres in London on the night after Christmas, and on Easter Monday, nominally for moral purposes, but really in mere pursuance of an old custom, but the custom is now pretty well worn out.

A collection of Lillo's works was published in 2 vols. 8vo, in 1775.

LILLY, WILLIAM, was born May 1, 1602, at Diseworth, a village of Leicestershire. When eleven years old he was sent to a grammar-school at Ashby-de-la-Zouch. His parents being poor, he removed to London in 1620, where he became servant to a mantua-maker. This situation he exchanged in 1624 for one of a less menial character. His new employer was master of the Salters' Company, who being unable to write himself, engaged Lilly to keep his accounts, and to perform domestic duties. In 1627 his master died, whereupon Lilly married the widow, with whom he received the sum of 1000*l.*; but this lady dying within a few years, he immediately took another wife, and thus augmented his fortune by 500*l.* In 1632 he began the study of astro-

logy under one Evans, a clergyman who had been expelled from his curacy for practising numerous frauds under pretence of discovering stolen goods. The same which Lilly soon acquired for casting nativities and foretelling events was such, that he was applied to in 1634 to ascertain, "by the use of the Mosaical or Miner's Rods," whether there was not extensive treasure buried beneath the cloisters of Westminster Abbey. Permission having been obtained from the dean on condition that he should have his share of whatever might be found, "Lilly and thirty other gentlemen entered the cloisters one night and applied the basel rods;" but after they had disinterred a few leaden coffins, a violent storm arose, which so alarmed them that they all took to their heels and ran home. In 1644 he published his first almanac, by the title of 'Merlinus Anglicus, Junior,' and such was the avidity with which the people received his prognostications, that the whole edition was sold in a few days, notwithstanding the "mutilations the work had suffered from the licencer of mathematical works." Lilly was subsequently arrested by the commissioners of the excise, on the ground that they had been personally insulted "by having their cloaks pulled on 'Change," and that the Excise-office had been burnt, both which events were attributed to the malicious predictions contained in his treatise called 'The Starry Messenger;' but upon its being proved that these events had happened prior to the publication of the work complained of, he regained his liberty. During the contest between Charles I. and the parliament, Lilly was consulted by the Royalists, with the king's privity, as to whether the king should sign the propositions of the parliament, and he received 20*l.* for his opinion. At the same time he was employed by the opposite party to furnish them with "perfect knowledge of the chiefest concerns of France," for which he received 50*l.* in cash and an annuity of 100*l.* per annum. The latter he enjoyed only two years. Until the affairs of Charles declined he was a cavalier; but after the year 1645 he engaged heartily in the cause of the parliament, and was one of the close committee to consult upon the king's execution. On the Restoration he declared that although he had served the parliament out of fear, he had always remained a cavalier in heart; but this time his advances were unheeded.

After burying his second wife and marrying a third, he died of palsy June 9th, 1681, and was buried at Walton-upon-Thames. A tablet was placed over his tomb in the chancel of the church, with a Latin inscription by Elias Ashmole. Previous to his death he had adopted a tailor for his son by the name of Merlin Junior, to whom he bequeathed the impression of his almanac, which had then been printed thirty-six years. "Most of the hieroglyphics," says Mr. Aubrey, "contained in this work were stolen from old monkish manuscripts. Moor, the almanac-maker, has stolen them from him, and doubtless some future almanac-maker will steal them from Moor." The character of Lilly has been faithfully drawn by Butler under the name of Sidrophel, although some authors have supposed that character to have been intended for Sir Paul Neal. By the facility with which he was enabled to impose upon the ignorance and superstition of all ranks of society, from the highest to the lowest, he succeeded in amassing considerable wealth. He was, to use the epithet of Dr. Nash, "a time-serving rascal," who did not hesitate to resort to any kind of deceit, and even perjury, in order to free himself from a dilemma, or gratify his love of money and renown.

For a list of Lilly's published works the reader is referred to Dr. Hutton's 'Mathematical Dictionary.'

LILY, LILYE, or LILLY, WILLIAM, an eminent schoolmaster, was born at Odiham in Hampshire, about 1468, and at eighteen years of age was admitted a demy of Magdalen College, Oxford. Having taken the degree of B.A., he quitted the university, and travelled towards the East, with the intent of acquiring a knowledge of the Greek language. He certainly remained five years at Rhodes, but it is not quite so certain, as Pitts and Wood assert; that he went for religion's sake to Jerusalem. From Rhodes he went to Rome and studied. On his return to England in 1509 he settled in London, set up a private grammar-school, and became the first teacher of Greek in the metropolis. His success and reputation were such that in 1512 Dean Colet, who had just founded St. Paul's School, appointed him the first master. He filled this useful and laborious employment for nearly twelve years, and in that time educated some youths who afterwards rose to eminence in life, among whom were Thomas Lupset, Sir Anthony Denny, Sir William Paget, Sir Edward North, and Leland the antiquary. Lily died of the plague at London in February 1523, at the age of fifty-four, and was buried in the north churchyard of St. Paul's.

Lily's principal literary production was his 'Brevissima Institutio, seu Ratio Grammaticæ Cognoscendæ,' 4to, London, 1513. It has probably passed through more editions than any other work of its kind, and is still commonly known as 'Lily's Grammar.' The English rudiments were written by Colet, and the preface to the first edition by Cardinal Wolsey. The English Syntax was written by Lily; and the rules for the genders of nouns, beginning with 'Propria quæ Maribus;' and those for the preterperfect tenses and supines, beginning with 'As in præsentî.' The Latin Syntax was chiefly the work of Erasmus.

(See Ward's Preface to his edition of 'Lily's Grammar,' 8vo, London, 1732.) Lily numbered Erasmus and Sir Thomas More among his intimate friends.

(Wood, *Athenæ Oxonienses*, Bliss's edition; Chalmers, *Biog. Dict.*; Tanner, *Bibl. Brit. Lib.*)

LIMBORCH, PHILIP VAN, was born at Amsterdam on the 19th of June 1633, and was educated at the University of Utrecht. He was one of the most distinguished of the Remonstrant or Arminian theologians, whose tenets were condemned at the Synod of Dort in 1618. In 1657 he became pastor of the Arminian or Remonstrant church in Gouda, and in 1668 of another church of the same persuasion in Amsterdam. He was also professor of theology in the same place, in the college of the Remonstrant party. He died on the 30th of April, 1712.

Limborch was a man of considerable learning, and his connection with the Arminian party, which suffered considerable persecution at that time from the Dutch government, probably led him to espouse those principles of religious liberty which distinguish most of his writings. He was on intimate terms with Locke, and carried on an extensive correspondence with him for many years. Several of his letters are printed in the third volume of Locke's works.

The most important of Limborch's works are:—'Præstantium ac Eruditorum Virorum Epistolæ,' Amst., 1660, 1684, 1704 (this volume contains the letters of Arminius and the most eminent of his followers on the distinguishing tenets of their system); 'Theologia Christiana,' 1686; 'De Veritate Religionis Christianæ, amica Collatio cum erudito Judæo,' 1687; 'Historia Inquisitionis,' 1692; 'Commentarius in Acta Apostolorum et in Epistolâ ad Romanos et Hebræos,' 1661. He also edited many works of the principal Arminian theologians.

LINACRE, or LYNACER, THOMAS, one of the most eminent physicians of his age, descended from the Linacres of Linacre Hall, in the parish of Chesterfield in Derbyshire, was born at Canterbury about 1460. He received his first education in his native city, under William Tilly, or De Selling, and afterwards entered at Oxford, where he was chosen a Fellow of All Souls College in 1484. Anxious for further improvement in learning, he accompanied De Selling into Italy, whether he was sent on an embassy to the court of Rome by King Henry VII. De Selling left him at Bologna with strong recommendations to Angelo Poliziano, then one of the best Latin scholars in Europe. Linacre removed thence to Florence, where Lorenzo de' Medici allowed him the privilege of attending the same preceptors with his own sons; and under Demetrius Chalcondylas, who had fled from Constantinople at the taking of that city by the Turks, he studied Greek. He then went to Rome, and studied medicine and natural philosophy under Hermolaus Barbarus. He applied himself particularly to the works of Aristotle and Galen, and is said to have been the first Englishman who made himself master of those writers in the original Greek. He also translated several of Galen's treatises into elegant Latin, and with Grocy and William Latymer undertook a translation of Aristotle, which was never completed. On his return to England he was incorporated M.D. at Oxford, which degree he had taken at Padua, and gave temporary lectures in physic, and taught the Greek language at Oxford. His reputation became so high that King Henry VII. called him to court, and intrusted him with the care both of the health and education of Prince Arthur.

In the reign of Henry VIII. Linacre stood at the head of his profession, and showed his attachment to its interests by founding two lectures on physic in the University of Oxford, and one in that of Cambridge. He may also be considered the founder of the College of Physicians in London, for in 1518 he obtained letters-patent from King Henry VIII., constituting a corporate body of regularly bred physicians in London, in whom was vested the sole right of examining and admitting persons to practise within the city and seven miles round it; and also of licensing practitioners throughout the whole kingdom, except such as were graduates of Oxford or Cambridge, who by virtue of their degrees were independent of the college, except within London and its precincts. The college had likewise authority given to it to examine prescriptions and drugs in apothecaries' shops. Linacre was the first president of the new college, and at his death he bequeathed to it his house in Knight-Rider-street, in which the meetings of the members had been held. Before this time medicine had been practised without control by pretenders of all kinds, but chiefly by monks, who were licensed by the bishops; and this charter was the first measure by which the well-educated physician was afforded the least advantage, beyond that which his own character would give him, over the most ignorant empiric.

Highly as Linacre was esteemed in his profession, he became desirous to change it for that of divinity, or rather to combine the two pursuits. In 1509 we find him in possession of the rectory of Mersham, which he resigned in the latter part of the same year, and was installed into the prebend of Eaton in the church of Wells; and afterwards, in 1518, he became possessed of a prebend in the cathedral of York, where he was also for a short time precentor. He had other preferments in the church, some of which he received from Archbishop Warham, as he gratefully acknowledges in a letter to that prelate. Dr. Knight informs us that he held a prebend in St. Stephen's chapel, Westminster; and Bishop Tanner, that he had the rectory of Wigan in Lancashire. He died of the stone, after great suffering, October 20, 1524, and was

buried in St. Paul's cathedral, where Dr. Caius erected a monument to his memory.

In his literary character, Linaere holds a high rank among the men of learning in this country. He was one of the first, in conjunction with Colet, Lily, Grocyon, and Latymer, who revived or rather introduced classical learning into England; and he conferred a benefit on his profession by translating into Latin several of the best pieces of Galen. These were—the treatises 'De Sanitate tuenda,' fol., Par., 1517; 'Methodus Medendi,' fol., Par., 1519; 'De Temperamentis,' 4to, Cambr., 1521 (the first book printed in England with types of the Greek characters); 'De Pulsuum Usu,' 4to, Lond., 1522; 'De Naturalibus Facultatibus,' 4to, Lond., 1523; 'De Symptomatum Differentiis liber unus: Ejusdem de Symptomatum Causis liber tres,' 4to, Lond., 1524. In these versions Linaere's style was excellent.

Linaere's translation of Proclus, 'De Sphæra,' was printed in the 'Astronomi Veteres' of 1499; his translation of Paulus Ægineta, 'De Crisi et Diebus decretoriis, eorumque signis, Fragmentum,' 8vo, Bas., 1529. He also wrote a small book upon the Rudiments of Latin Grammar, in English, for the use of the Princess Mary, first printed by Pynson without date, and afterwards translated into Latin by Buchanan. But his most learned work was his treatise 'De Emendata Structura Latini Sermonis libri sex,' printed at London immediately after his death in 1524, and frequently reprinted in later years in the 16th century.

Of Linaere's talents as a physician no testimony remains except the high repute which he enjoyed. For the excellence of his translations from Galen it may be sufficient to quote the praise of Erasmus, who, writing to a friend, says, "I present you with the works of Galen, now, by the help of Linaere, speaking better Latin than they ever before spoke Greek."

There are two copies of Linaere's 'Methodus Medendi,' upon vellum, in the British Museum: one a presentation copy to King Henry VIII, the other to Cardinal Wolsey; and a dedicatory letter, in manuscript, to Wolsey, precedes, in his copy, the dedication to Henry VIII. The British Museum also contains the treatise 'De Sanitate tuenda' upon vellum. This was Wolsey's copy, and has the cardinal's hat illuminated in the title, and a similar dedicatory letter similarly placed.

* LIND, JENNY (MADAME GOLDSCHMIDT), was born Oct. 6, 1821, in the city of Stockholm, where her father was a teacher of languages, and her mother kept a school for young ladies. Her musical capabilities and her sweet voice attracted notice while she was yet very young, and she obtained admission as a pupil into the Musical Academy, where her progress in the art of singing was extremely rapid and satisfactory. At the age of ten years she was introduced on the stage as a performer of juvenile characters, and continued to sing and act in vaudevilles with great applause till about her twelfth year, when the upper notes of her voice became less pleasing, and it was deemed advisable to withdraw her from the stage. After an interval of about four years her voice was found to have recovered its tone as well as increased in power, and when she made her appearance as Agatha in the opera of 'Der Freischütz' she excited the greatest admiration. She was engaged for the opera at Stockholm, and continued to be the leading favourite for three or four years, when she removed to Paris in order to improve herself by taking lessons from Garcia, the celebrated singing-master. After remaining about a year in Paris she was introduced to Meyerbeer, who engaged her for the opera at Berlin. It was however deemed advisable to make some preparatory trials before German audiences. Having returned for a short time to Stockholm to complete her engagement there, she repaired in August 1844 to Dresden, where Meyerbeer was then residing. After performing a few characters there with great success, in the summer of 1845 she attended the fêtes on the Rhine given by the King of Prussia to Queen Victoria, and sang at Frankfurt and Cologne. In the following winter she came out at Berlin, where she excited the highest enthusiasm, as well as subsequently at Vienna, where she made her first appearance in April 1846. On the 4th of May 1847 she appeared for the first time at the Opera House, London, as Alice in Meyerbeer's opera of 'Roberto il Diavolo,' and received the enthusiastic plaudits of an audience crowded to excess. She became the star of the season, filling the house with similar audiences on every night of her appearance. She afterwards sang in the provinces, and was again engaged for the following season in London. She also sang at concerts and oratorios. Her concluding performance in London was on the 9th of May, 1849, in 'Roberto il Diavolo;' after which she returned to Germany, and while at Lübeck entered into an engagement with Mr. Barnum, the American speculator, to sing in America. She landed at New York in September 1850. The applause which she received there and in other cities and towns of the United States was quite as great as it had been in Europe. In June 1851 she concluded her engagement with Mr. Barnum, and commenced a series of concerts on her own account. In the same year Miss Lind was married to M. Otto Goldschmidt, a skilful performer on the pianoforte. Madame Goldschmidt returned with her husband to Europe in 1852. She has since lived partly in retirement, but has appeared occasionally at concerts in Vienna and elsewhere in Germany, and also in England in the winter of 1855-56. Her voice is a soprano,

with a compass of nearly two octaves and a half. The upper notes especially are very clear, delicious in tone, flexible, and perfectly at her command. Her acting was also very perfect, particularly in such characters as Amina in 'La Sonnambula,' Susanna in 'Le Nozze di Figaro,' Alice in 'Roberto il Diavolo,' and several others. The private life of this most celebrated of vocalists has always furnished a high example of moral elevation; but her munificent charities, of which England has received abundantly, have produced a love and veneration for her character as warm as the admiration of her professional talents.

LINDE, SAMUEL BOGUMIL, the great lexicographer of Poland, was of immediate Swedish descent. His father was a native of Dalecarlia, who was settled at Thorn in Poland when Linde was born in 1771. After receiving a good education in the schools of Thorn, he was sent, at the age of eighteen, to study in the university of Leipzig, where he attracted the favourable notice of Professor August Wilhelm Ernesti, the editor of Livy and Tacitus. "Ernesti" says Linde, in one of the prefaces to his great work, the Polish Dictionary, "struck out for me, without my knowledge, an opening to a career which he thought would be for my benefit. One day he told me, to my great surprise, that he had written some weeks before to Dresden, to recommend that a chair of the Polish language and literature should be entrusted to me at the university of Leipzig. I told him, with some consternation, that I was not well acquainted with Polish; that all I knew of it was what clung to my memory from the mere intercourse of daily life at Thorn, where I was much neglected, and that if I were made professor I should myself be obliged to begin to learn the language anew from the first rudiments." In the course of 1792 however Linde received the appointment, and began to do as he had said. Among the books that he procured from Poland was the 'Powrot Posla' ('The Deputy's Return'), a satirical play, directed against the national failings of the Poles, which he found so excellent, that, though many passages were beyond his comprehension, he commenced a translation, with the intention of making use of the original as a book for study with his pupils. It was lying on his table when two Polish gentlemen called on him, whose attention was at once attracted by the book, and he asked them if they could inform him who was the author of that anonymous masterpiece. One of them, Julian Niemcewicz, replied, "I wrote it." "That moment," Linde afterwards said, was "the decisive moment of my life." Niemcewicz became his intimate friend, explained to him the passages that had perplexed him, and introduced him to the society of the other distinguished Poles then living at Leipzig, to which it appears the professor had hitherto had no access. Among them were the Counts Potocki, Kollotaj, and Thaddeus Kosciuszko, some of the most illustrious names of Poland. Linde, who now first heard his native idiom from the lips of gentlemen and scholars, became fired with enthusiasm for the Polish language and resolved to devote himself to the production of a great Polish dictionary. He took this resolution at the age of twenty-two; he published the last volume of his great work twenty-one years after, having worked at it almost unremittingly during the interval. The Dictionary of the Polish Language, 'Słownik Języka Polskiego,' occupies six quarto volumes, of which the first was published at Warsaw in 1807, and the last in 1814. It fills about five thousand quarto pages in closely printed double columns; to every word is appended an explanation in Polish and German, a comparison with the forms which resemble it in the other Slavonic dialects, and a collection of passages from authors in which it occurs, to amass which Linde read through six or seven hundred of the principal works in Polish, of which he gives a list in the first volume. It was the first great dictionary of the Polish language; it has served as the basis for every subsequent one, and though of course susceptible of improvement and augmentations it is not likely to be ever either superseded or surpassed. In the course of its preparation Linde soon resigned the professorship at Leipzig which had first given rise to it, passed some time at Warsaw, then became librarian to Count Ossolinski at Vienna, and had the congenial employment of travelling in Poland to collect Polish books, by which he enriched the library and his Dictionary together, and lastly established himself at Warsaw to superintend the printing, which was carried on in his own house by compositors and pressmen, some of whom had the privilege of immortalising themselves by affixing their own names at the end. These labours were carried on during a stormy period, but the house in which the Dictionary was printing was repeatedly spared by contending armies, and the author received support from the Prussian and the Austrian governments, and in particular from the Russian, as well as from numerous Polish magnates, one of whom, Count Zamoycki, when the works were on one occasion brought to a stand-still by an absolute want of pecuniary means, sold a favourite horse and sent the proceeds to the lexicographer. Linde held various appointments connected with the educational establishments of Poland, and was enabled to introduce extensive reforms. He continued to reside at Warsaw as rector of the Lyceum and principal librarian of the university, during the long period of comparative tranquillity which preceded the insurrection of 1830, and though he was elected to the revolutionary diet as member for Praga, was averse to that unfortunate movement, which he thought ill-timed and likely to issue in nothing but calamity. Fryxell the Swedish historian, who, in his travels in search of Swedish documents, was surprised to discover that the Polish lexicographer

was the son of one of his own countrymen, found him depressed and melancholy in the year 1834. "It was instructive," says Fryxell, in the preface to his 'Handlinger rorande Scandinaviens Historia,' "to bear him trace the true reasons of Poland's fall first and foremost in the national character of the Poles themselves, instructive especially for a Swede, who belongs to a country which has the same powerful and wily neighbour that Poland had, and who bears the same misleading doctrines preached around him which ended in subjecting Poland to the Russian yoke." Linde had at that time been reappointed by the Russian government to some of the educational posts he formerly held, but he resigned them in 1838, and appears to have lived in retirement till his death on the 8th of August 1847 at Warsaw. In addition to his Dictionary he was the author of a work in Polish on the statutes of Lithuania, and he translated from the Russian Grech's 'History of Russian Literature,' with an appendix of additions. His pen was frequently employed in rendering Polish works into German, the language with which to the last he seems to have been most familiar. The most important of these was his translation (Warsaw, 1822) of the Dissertation on Kadlubek, the old Polish historian, by his friend and patron Count Ossolinski, who it should be mentioned assisted materially in the composition of the Dictionary, and to whom in conjunction with Prince Czartoryski, also a munificent patron, that work is dedicated.

* LINDLEY, JOHN, LL.D., a distinguished living botanist. His family is a branch of the Lindleys of Jowet House in Yorkshire, who were trustees of the Earl of Essex in the reign of Queen Elizabeth. He was born February 5, 1799, at Catton, near Norwich, where his father was owner of a considerable nursery garden. He was the author of a work, entitled 'A Guide to Orchard and Kitchen Gardens,' an edition of which has since been edited by his son. In this way the young Lindley had his attention early directed to the science in which he has become so eminent. He received his early education at the Grammar-school at Norwich.

One of the earliest botanical labours of Dr. Lindley was the translation of Richard's 'Analyse du Fruit,' which appeared in 1819. In 1820 he published his 'Monographia Rosarum,' which contained the description of new species, and was illustrated by several drawings executed by the author. In 1821 he published a paper in the 'Transactions of the Linnæan Society,' entitled 'Observations on Pomaceæ.' In the same year he published a paper on the structure of the Lemnæa (Duckweed) in Hooker's 'Flora Scotica.' In this paper he first pointed out the true structure of those plants, and demonstrated the existence of pistils and stamens in their minute fronds. Two other separate works were also published in this year, 'Monographia Digitalium,' a work containing descriptions of the various species of Foxglove, and a miscellaneous contribution entitled 'Collectanea Botanica.'

About this time he came to London, and was engaged by the late Mr. Loudon to write the descriptive portion of his 'Encyclopedia of Plants.' This work was published in 1829. In his preface Mr. Loudon says, "The botanical merits of this volume belong entirely to Professor Lindley; he determined the genera and the number of species to be arranged under them, prepared the specific characters, derivations, and accentuations; he either wrote or examined the notes, and corrected the whole while passing through the press." This gigantic work prepared Dr. Lindley for further work. Although the Encyclopedia was arranged according to the artificial system, its preparation had placed him in a position to compare the natural arrangement which had been suggested by Ray, and improved by Adanson, Jussieu, and Robert Brown, with that of Linnæus. The result was that he became one of the warmest advocates of the cultivation of the natural system, and has done more than any other English writer to make it popularly known. His next work, published in 1830, was an 'Introduction to the Natural System of Botany.' This work was an arrangement of the vegetable kingdom upon the natural system, and was accompanied by an essay upon the objects and advantages of this system.

In 1832 he published his 'Introduction to Systematic and Physiological Botany.' In this work the structure and physiology of plants were treated in a much more complete manner than had been previously done by any English writer. In order to render the natural system available for the study of British plants, he published a 'Synopsis of the British Flora,' in which the species of British plants were arranged according to the natural system.

In 1833 he published the 'Nexus Plantarum,' in which he introduced some alterations in the arrangement of plants according to the natural system. A second edition with further alterations was published under the title of 'Key to Systematic Botany.' This work also comprised a general outline of the principles of vegetable structure and physiology, forming a second edition of a smaller work previously published, entitled 'Outlines of the First Principles of Botany.'

In 1836, when a new edition of the Introduction of the Natural System was required, he remodelled the whole work and gave lists of the genera of plants under the description of the natural families. This work was entitled 'A Natural System of Botany.' In this work the author propounded some new views of classification, and modified the nomenclature of the natural families.

In 1846 this work was expanded into 'The Vegetable Kingdom,'

a work by far the most comprehensive and complete of any that have hitherto appeared on the subject of systematic botany. An improved system of classification was again introduced, and a more detailed description of the families, especially those belonging to the class *Cryptogamia* were given, and new and more extended lists of the genera were added: references to plants useful to man, and an illustration in wood engraving of every natural order, rendered this volume a most important contribution to the literature of botany. This work has already gone through several editions.

Whilst Dr. Lindley has been thus engaged in correcting and criticising the general arrangement of plants, he has been most diligent in the description of genera and species. In 1838 appeared his 'Flora Medica,' in which all the species of plants used in British medicines were described in detail. He has been for many years editor of the 'Botanical Register,' and a constant contributor. In 1819 he described in its pages the *Maranta Zebрина*. In 1821 he for the first time defined and distinguished the natural order *Calycanthaceæ*, and a host of species testify to his accurate definitions and extraordinary industry.

When the 'Penny Cyclopædia' was originally started, Dr. Lindley commenced writing the botanical articles, and continued them as far as the letter R. Some of these are valuable contributions to botanical science, such as the articles 'Botany,' 'Exogens,' and 'Endogens.'

Besides the monographs before alluded to, Dr. Lindley has published one 'On the genera and species of Orchidaceæ,' splendidly illustrated by the inimitable pencil of Francis Bauer. To this group of plants Dr. Lindley has paid great attention, and successfully elucidated some of the difficult points of their structure.

Dr. Lindley has not confined his attention to recent plants alone, and in conjunction with Mr. Hutton he has published the 'Fossil Flora of Great Britain,' which consists of descriptions and figures of all the fossil plants known up to the time it was published. This work was published in parts, and commenced in 1833.

Dr. Lindley has not only written for the botanist, but for the people. One of the best introductions to the science of botany in its day was his 'Botany,' in the series of the Library of Useful Knowledge, published by the Society for the Diffusion of Useful Knowledge. He has also, after the manner of the 'Botanical Letters' of Jean Jacques Rousseau, written a work called 'Ladies' Botany,' in which a knowledge of the structure of the natural orders is very gracefully conveyed in the form of a series of letters. He has also written a very cheap introduction to the science of botany, with a large number of woodcuts, under the title of 'School Botany.' In this work, besides a structural and physiological introduction, the natural orders of the European flora are described and illustrated by genera and species, and the whole is arranged according to De Candolle's system.

In the midst of his scientific labours, Dr. Lindley never appears to have forgotten a practical aim. In his father's nursery he saw that gardening was to be improved by science. He felt there was no higher aim for science than making it subservient to the daily wants of man. Thus we find him applying the principles of scientific botany to the art of horticulture. A third edition of his 'Theory of Horticulture' has recently appeared. This work contains by far the best exposition of the principles of horticulture extant. Not satisfied however with this exhibition of the principles of his science, he has since 1841 edited a horticultural newspaper, 'The Gardeners' Chronicle.' This weekly epitome of horticultural and agricultural knowledge has been conducted with great ability, and is a repository of most useful facts and theories, alike useful to the practical and scientific man.

Dr. Lindley has now been for a quarter of a century the laborious Professor of Botany at University College, London. In 1829, when that institution was yet called the London University, he was appointed to the chair of botany. At that time little attention had been paid to the study of botany as a branch of education in London, and although looked upon chiefly as a branch of medical education, it did not, as an especial subject, enter into the required course of study of any of the corporate bodies which granted licences for practising the various branches of medicine. When Dr. Lindley was appointed, the success of the chair was looked upon as doubtful, botany having been always taught in connection with *materia medica*, and not being very popular as a science. Dr. Lindley's success as a lecturer was complete, and since that time, medical students have been required to attend a course of lectures on botany.

In 1831 Dr. Lindley was appointed lecturer on botany at the Royal Institution, a post which it is to be regretted has not been filled up since his retirement. In 1835 he was appointed successor to Professor Burnett as lecturer on botany at the Botanic Gardens at Chelsea. These gardens are the property of the Apothecaries' Society, and contained an admirable collection of plants, which it was the duty of the lecturer to illustrate. These lectures, though highly appreciated by the medical students of London, have also been discontinued.

Notwithstanding the occupation afforded by his books and lectures, Dr. Lindley has been assistant secretary to the Horticultural Society since 1822. Under his vigorous management this society maintained for many years a most extensive horticultural establishment at Turnham Green, and a large number of new plants and fruits were introduced by its agency. The funds however by which it was carried on were mainly derived from the public shows of fruit and flowers. These were

latterly not so well attended on account of rival shows in the Regent's Park, London, and at the Crystal Palace, and consequently this useful part of the society's labours has recently had to be given up. Its 'Transactions' and 'Proceedings' both contain papers by its active assistant secretary.

Dr. Lindley has received many honours on account of his scientific merits. In 1833 the University of Munich presented him with the degree of Ph. D. He is a Fellow of the Royal Linnæan and Geological Societies. He was one of the early Presidents of the Microscopical Society, and he has been elected honorary or corresponding member of the Royal Academy of Sciences of Berlin, the Linnæan Society of Stockholm, the Dutch Society of Science, the Royal Prussian Horticultural Society, the New York Lyceum of Natural History, the Botanical Society of Ratisbon, and many others.

* LINDSAY, ALEXANDER WILLIAM CRAWFORD, LORD, the eldest son of James Lindsay, twenty-fourth Earl of Crawford and Balcarras, and premier earl of Scotland, was born in 1812. He was educated at Trinity College, Cambridge, after which he travelled both in Europe and Asia Minor; and in 1838 published 'Letters on Egypt, Edom, and the Holy Land,' in 2 vols. 8vo. In 1841 he published a 'Letter to a Friend on the Evidence and Theory of Christianity.' Already he had become strongly imbued with those mystical principles which, originally emanating from the philosophers of the East, have of late been resuscitated and earnestly advocated in the West. The first formal enunciation of his views appeared in his 'Progression by Antagonism, a Theory involving Considerations touching the Present Position, Duties, and Destiny of Great Britain;' but the work was rather regarded with curiosity than listened to as authoritative. It was followed by a work of much greater research and value, 'Sketches of the History of Christian Art,' 3 vols. 8vo, 1847. In this Lord Lindsay has undertaken a survey, first, of the various schools of 'Pagan' art, and endeavoured to elucidate the 'idea' that lies at the base of their several systems of art and gives to each its peculiar expression and value, and at the same time limits its attainments. He then does the same for 'Christian' art, examining with great research and learning its development in the early and mediæval periods, and especially investigating the symbolism and 'mythology' of Christian art as distinct from that of classical or pagan art. A full and elaborate classification of both schools and artists is given; and, in short, the work, though entitled 'Sketches,' is intended to present a comprehensive survey of the whole subject—taken of course from the author's peculiar point of view. The work is written with very considerable power and eloquence, and will probably maintain by its merits the high place it at first secured by its novelty. Lord Lindsay's subsequent works have been in a very different line, that, namely, of family history. In 1849 he published the 'Lives of the Lindsays, or, a Memoir of the Houses of Crawford and Balcarras,' 3 vols. 8vo, a work of extensive and minute research, admirably written in every respect, and full of interesting matter. He has recently printed another work, but it is merely of private or family interest, being a defence of the claims of his branch of the family to the title.

LINDSAY, SIR DAVID, a Scottish poet, was born at Garmylton, in Haddingtonshire, about the end of the 15th century. He inherited from his father the estate of 'The Mount,' in Fifeshire, whence, to distinguish him from many others of the same name, he is usually called Sir David Lindsay of the Mount. In the year 1512, he was appointed servitor, or gentleman usher, to the young prince of Scotland, afterwards James V., in which office his duties seem really to have been of a servile kind. There is little doubt that his genius and good-humour must have made him a very animated and delightful companion to his charge. He seems never to have been entrusted with the education of the prince, which was placed in the hands of a much graver personage—Bishop Gavin Dunbar.

Lindsay's name is connected with a curious and poetical incident. He is the authority on which his kinsman, Lindsay of Pitcautie, in his 'Chronicles of Scotland,' describes a spectral apparition which, in 1513, appeared to James IV. in the church of Linlithgow, and warned him against that campaign which terminated so fatally in the battle of Flodden. Sir David professed to have seen the apparition approach and vanish, and described him as "ane man clad in a blue gown, beltit about him with a roll of linen cloth, a pair of bootkins on his feet to the great of his legs, with all other clothes conform theret."

The 'Dreme,' supposed to be the earliest of his writings, appeared in 1528; it is a satire on the times, representing a vision of the punishment of the prevailing iniquities in the other world. His principal pieces are 'Complaint of the Papingo;' 'Complaint of John the Commonwell;' 'History of Squyer Meldrum;' 'The Monarchie;' and 'The Play, or Satire on the Three Estates.' There is little sentiment or pathos in Lindsay's poetry—a fierce and unscrupulous tone of sarcasm is his principal quality. All that was powerful in the country came under his lash, and it is one of the most inexplicable circumstances in literary history that he should not have been the victim of his audacity. He particularly excelled in his attacks on the priesthood and the corruptions of the court; and after the Reformation his name was long popular as that of a Protestant champion. 'The Satire on the Three Estates' stands half way between the early 'Mysteries' and the dramas of the latter part of the 16th century. It was sometimes acted in the open air, and could not have failed strongly to excite popular feeling

against the corruptions, civil and ecclesiastical, which it unsparingly expose. "It is a singular proof," says Sir Walter Scott, "of the liberty allowed to such representations at the period, that James V. and his queen repeatedly witnessed a piece in which the corruptions of the existing government and religion were treated with such satirical severity." Another feature that makes the circumstance of Lindsay's performances having such an audience, seem strange at the present day, is their broad indecency. It is certainly beyond that of the other writers of the age, for 'Davie Lindsay,' as he was long called in Scotland, seems to have had an innate liking for what was impure. His 'Squyer Meldrum' is a sort of chivalric history of adventures, some of which exhibit a very loose and dangerous morality. Lindsay held the office of Lord Lyon King at Arms. In 1537 he had the task of preparing some masques or pageants to celebrate the arrival of Mary of Guise, queen of James V. The time of his death is not known, but he is said to have been alive in 1567.

(Lord Lindsay, *Lives of the Lindsays*; Irving, *Lives of Scottish Poets*.)

LINDSEY, REV. THEOPHILUS, was the youngest son, by a second marriage, of a respectable mercer and proprietor of salt-works, residing at Middlewich, in Cheshire, where he was born June 20, 1723 (Old Style). He entered St. John's College, Cambridge, in 1741; and, after taking his degrees, was elected fellow in 1747, about which time, in his twenty-third year, he commenced his clerical duties at an episcopal chapel in Spital-square, London. He then became domestic chaplain to Algernon, duke of Somerset, after whose death, he travelled for two years on the Continent with his son, subsequently Duke of Northumberland. On his return, about 1753, he was presented to the living of Kirkby Wiske, in the North Riding of Yorkshire; and in 1756 he removed to that of Piddletown, in Dorsetshire. In 1760 he married a step-daughter of his intimate friend Archdeacon Blackburne, and in 1763, chiefly for the sake of enjoying his society, and that of other friends in Yorkshire, he exchanged the living of Piddletown for that of Catterick, which was of inferior value.

Before this removal Lindsey, who had felt some scruples respecting subscription to the thirty-nine articles even while at Cambridge, began to entertain serious doubts concerning the Trinitarian doctrines of the offices of the Church of England, though, for reasons explained at some length by his principal biographer, on his own authority, he did not deem these a sufficient obstacle to the renewal of his assent to them on entering a new living. In 1769 his anti-Trinitarian opinions received additional strength from the commencement of an intimacy with the Rev. William Turner, a presbyterian minister at Wakefield, and Dr. Priestley, then a unitarian minister at Leeds, both of whom entertained similar views with himself. While contemplating the duty of resigning his living, Lindsey was induced to defer that step by an attempt which was made in 1771, by several clergymen and gentlemen of the learned professions, to obtain relief from parliament in the matter of subscription to the thirty-nine articles, and in which he joined heartily, travelling upwards of 2000 miles in the winter of that year to obtain signatures to the petition which was prepared. The petition was presented on the 6th of February 1772, with nearly 250 signatures; but, after a spirited debate, its reception was negatived by 217 to 71. It being intended to renew the application to parliament in the next session, Lindsey still deferred his resignation; but when the intention was abandoned he began to prepare for that important step, which involved not only severe pecuniary sacrifices, but also the breaking-off from many esteemed friends. He drew up, in July 1773, a copious and learned 'Apology' for the step he was about to take, which was subsequently published. In the following December, notwithstanding the attempts of his diocesan and others to dissuade him from the step, he formally resigned his connection with the Established Church, and, selling the greatest part of his library to meet his pecuniary exigencies, he proceeded to London, which he reached in January 1774. On the 17th of April 1774, he began to officiate in a room in Essex-street, Strand, which, by the help of friends, he had been enabled to convert into a temporary chapel. His desire being to deviate as little as possible from the mode of worship adopted in the Church of England, he used a liturgy very slightly altered from that modification of the national church-service which had been previously published by Dr. Samuel Clarke; which modified liturgy, as well as his opening sermon, Lindsey published. Being very successful in his efforts to raise a Unitarian congregation, he was able shortly afterwards to commence the erection of a more permanent chapel in Essex-street, which was opened in 1778, and which, together with an adjoining residence for the minister, was put in trust for the maintenance of Unitarian worship. His published 'Apology' having been attacked in print by Mr. Burch, an Irish M.P., by Mr. Bingham, and by Dr. Randolph, Lindsey published a 'Sequel' to it in 1776, in which he answered those writers. In 1781 he published 'The Catechist, or an Inquiry into the Doctrine of the Scriptures concerning the only True God, and object of Religious Worship;' in 1783, 'An Historical View of the State of the Unitarian Doctrine and Worship from the Reformation to our own times,' an elaborate work, which had been several years in preparation; and in 1785, anonymously, 'An Examination of Mr. Robinson of Cambridge's Plea for the Divinity of our Lord Jesus Christ, by a late member of the University.' In 1788 he published 'Vindiciæ Priestleianæ,' a defence of his friend Dr. Priestley,

in the form of an address to the students of Oxford and Cambridge; and this was followed in 1790 by a 'Second Address to the Students of Oxford and Cambridge, relating to Jesus Christ, and the origin of the great errors concerning him.' In 1782 he invited Dr. Disney, who then left the Established Church on the same grounds as he had done himself, to become his colleague in the ministry at Essex-street; and in 1793, on account of age and growing infirmities, he resigned the pastorate entirely into his hands, publishing on the occasion a farewell discourse (which he felt himself unable to preach), and a revised edition, being the fourth, of his liturgy. He nevertheless continued to reside at the chapel-house, as did his wife after his death. In 1795 he reprinted, with an original preface, the 'Letters to a Philosophical Unbeliever,' which Dr. Priestley had recently published in America in reply to Paine's 'Age of Reason;' and in 1800 he republished in like way another of Priestley's works, on the knowledge which the Hebrews had of a future state. Lindsey's last work was published in 1802, entitled 'Conversations on the Divine Government; showing that everything is from God, and for good to all.' He died on the 3rd of November 1808, in his eighty-sixth year, and was buried at Bunhill-fields. Besides copious biographical notices of Lindsey, which were published in the 'Monthly Repository' and 'Monthly Magazine' of December 1808, the Rev. Thomas Belsham published in 1812 a thick octavo volume of 'Memoirs,' in which he gives a full analysis of his works, and extracts from his correspondence, together with a complete list of his publications. Two volumes of his sermons were printed shortly after his death.

LINGARD, REV. JOHN, D.D. and LL.D., was born February 5, 1771, in the city of Winchester. He belonged to a Roman Catholic family in humble circumstances, and studied at the Roman Catholic College at Douay, in France, whither he was sent by the Roman Catholic Bishop Talbot, and there he remained till the revolutionary troubles obliged the small community to seek shelter in England. After several intermediate removals the college settled at Crook-hall, in the county of Durham, and subsequently at Ushaw, near the city of Durham. Mr. Lingard accompanied the college, and performed the duties of some of its offices. He revisited France for a short time during the dangerous period of the revolution, and on one occasion escaped with difficulty from being suspended 'à la lanterne.' In 1805 he wrote for the 'Newcastle Courant' a series of letters, which were collected and published under the title of 'Catholic Loyalty vindicated,' 12mo. He afterwards wrote several controversial pamphlets, which in 1813 were published in a volume having the title of 'Tracts on several Subjects connected with the Civil and Religious Principles of the Catholics;' and he was also the author of 'Catechetical Instructions on the Doctrines and Worship of the Catholic Church,' of which there have been several editions. In 1836 he published anonymously an English translation of the New Testament, which is said to be accurate and faithful in several passages where the Douay translation is faulty. In 1845 he published the 'History and Antiquities of the Anglo-Saxon Church,' 2 vols. 8vo.

Dr. Lingard's great work, the 'History of England from the First Invasion by the Romans to the Accession of William and Mary in 1688,' was first published in 6 vols. 4to, London, 1819-25; second edition in 14 vols. 8vo, 1823-31; fourth edition, in 13 vols. 12mo, 1837; fifth edition, 10 vols. 8vo, 1849-50; and sixth edition, 10 vols. 8vo, 1854-55. Dr. Lingard's 'History of England' is a work of great research, founded on ancient writers and original documents, displaying much erudition and acuteness, and opening fields of inquiry previously unexplored. The narrative is clear, the dates accurately given, and the authorities referred to distinctly. The style is perspicuous, terse, and unostentatious. The work perhaps exhibits too exclusively the great facts and circumstances, military, civil, and ecclesiastical, and enters less than might be desirable into the manners, customs, arts, and condition of the people. In all matters connected with the church the work is, as might have been expected, coloured by the very decided religious opinions of the author; but these are not offensively set forth.

Dr. Lingard, after the completion of his 'History of England,' paid a visit to Rome, where Pope Leo XII. offered to make him a cardinal, but he refused the dignity. He spent the last forty years of his life at Hornby, near Lancaster, where he died July 13, 1851. He was buried in the cemetery of St. Cuthbert's College, at Ushaw, to which institution he bequeathed his library. His latter years were rendered comfortable by the profits of his 'History,' and a pension of 300*l.* a year from the Queen for his services to literature.

L'INGEGNO. [LUIGI, ANDREA DL.]

LINLEY, THOMAS, a composer who ranks high in the English school of music, was born at Wells, about the year 1725. He was first the pupil of Chilcot, organist of the abbey, Bath, and finished his studies under Paradise, an eminent Venetian, who had become a resident in this country. Mr. Linley established himself in Bath, where he was much sought after as a teacher, and carried on the concerts in that place, then the resort of all the fashionable world during a part of every year. To the attraction of these, his two daughters, Eliza and Mary, afterwards Mrs. Sheridan and Mrs. Tickell, by their admirable singing, contributed very largely.

On the retirement of Christopher Smith, who had been Handel's amanuensis, and succeeded him in the management of the London

oratorios, Mr. Linley, by the advice of his son-in-law Mr. Sheridan, united with Mr. Stanley, the blind composer, in continuing those performances; and on the death of Stanley, Dr. Arnold joined Linley in the same, an undertaking by no means unprofitable in its results. In 1775 he set the music to Sheridan's opera 'The Duenna,' which had a run unparalleled in dramatic annals; it was performed seventy-five times during that season. This led to his entering into a treaty to purchase Mr. Garrick's moiety of Drury-lane theatre; and in 1776 he, conjointly with Mr. Sheridan, bought two-sevenths of it, for which they paid 20,000*l.*, Dr. Ford taking the other three-fourteenths, and the chief management was entrusted to Sheridan, while to Linley was assigned the direction of the musical department. He now devoted his time to the theatre, and, among other pieces, produced his 'Carnival of Venice;' 'Selima and Azor,' from the French; and 'The Camp,' Sheridan's second production. He also added those charming accompaniments to the airs in 'The Beggars Opera,' which are still in use. His Six Elegies, written in the early part of his life, contributed in no small degree to his immediate fame and future fortune; they were sung by all who could sing, and will continue to be admired by those who have taste enough to appreciate what is at once original, simple, and beautiful. His Twelve Ballads are lovely melodies, but have fallen into temporary neglect like many other excellent English compositions. His madrigal 'Let me careless and unthoughtful lying' (one of Cowley's Fragments), is a work which certainly has no superior, if any equal, of the sort.

Mr. Sheridan's political and social engagements having occupied a large portion of the time which, in prudence, ought to have been devoted to the theatre, the management of its details fell much on Mr. Linley; and herein he derived great assistance from his wife, a lady of strong mind and active habits, by whose care the pecuniary affairs of that vast concern were well regulated, so long as she had any control over them.

Mr. Linley survived his two accomplished daughters and several of his other children. But some years previous to their decease he suffered a shock by the loss of his eldest son Thomas Linley, who was drowned by the upsetting of a boat while on a visit to the Duke of Ancaster, in Lincolnshire, from which and his subsequent bereavements his mind never entirely recovered. This young man, who had just reached his twenty-second year, possessed genius of a superior order. His musical education was as perfect as his father's and Dr. Boyce's instructions and those of the best masters of Italy and Germany could render it, and he had given decided proofs of its efficiency when the fatal accident occurred. None out of his own family more lamented the event than his friend the celebrated Mozart, with whom he had lived on the Continent in the closest intimacy, and who always continued to mention him in terms of affection and admiration. Mr. Linley died in 1795, leaving a widow, a daughter, and two sons, of whom

WILLIAM LINLEY, born about 1767, and educated at Harrow and St. Paul's schools, was the younger. Mr. Fox appointed him to a writership at Madras, and he soon rose to the responsible situations of paymaster at Vellore and sub-treasurer at Fort St. George. He returned from India early, with an easy independence, and devoted the remainder of his life partly to literary pursuits, but chiefly to music, of which he was passionately fond, a talent for the art coming to him as it were by inheritance. He produced a considerable number of glees, all of them evincing great originality of thought and refined taste, some of which will make him known to posterity. Mr. W. Linley also published, at various periods, a set of Songs, two sets of Canzonets, together with many detached pieces. He was likewise the compiler of the 'Dramatic Songs of Shakspeare,' in two folio volumes, a work of much research and judgment, in which are several of his own elegant and sensible compositions. Early in life he wrote two comic operas, which were performed at Drury-Lane Theatre; also two novels, and several short pieces of poetry. He likewise produced an elegy on the death of his sister Mrs. Sheridan, part of which is printed in Moore's 'Life of Richard Brinsley Sheridan.' This last survivor of the Linley family died in 1835.

LINNÆUS, or VON LINNÉ, CARL, was born at Råshult, in the province of Smaland, in Sweden, May 13, 1707 (Old Style). His father, Nicholas Linnæus, was the assistant clergyman of a small village called Stendrobult, of which Råshult was a hamlet, and is related to have resided in a "delightful spot, on the banks of a fine lake, surrounded by hills and valleys, woods and cultivated ground," where it is believed that the son imbibed in his earliest youth a fondness for the objects of animated nature. His maternal uncle too, who educated him, is said to have been conversant in plants and horticulture; and thus, according to the declaration of Linnæus himself, he was at once transferred from his cradle to a garden. The father seems to have himself had some acquaintance with botany, and to have instructed his boy at a very early age in the names of the natural objects which surrounded them. Linnæus however is said to have had little taste for remembering names, and his father found it no easy matter to overcome this inaptitude; he however at last succeeded, and the consequence was sufficiently conspicuous in the decided turn for nomenclature which the mind of the pupil eventually took. Whether in the next stages of learning Linnæus was ill-managed, as he himself thought, or whether the nature of his education at home had rendered him indisposed for

drier and severer studies, it is certain that his preceptors found great cause to complain of him, and the schoolmaster at Wexio pronounced him, at the age of nineteen, if not a positive blockhead, at all events unfit for the church, for which he was intended: they in fact recommended him to be apprenticed to some handicraft trade. Bishop Agardh admits that when, at the age of twenty, Linnæus arrived at the University of Lund, for the purpose of studying medicine, the profession finally determined upon for him, he was less known for his acquaintance with natural history than for his ignorance of everything else.

Matriculated at Lund, Linnæus was so fortunate as to be received into the house of Dr. Stobæus, a physician possessing a fine library and a considerable knowledge of natural history. This amiable man was not slow to discover the signs of future greatness in his lodger; he gave him unrestrained access to his books, his collections, his table, and above all to his society, and would at last have adopted him for his son and heir. It was at this time that Linnæus first began to acquire a knowledge of what had been already written upon natural history, to gain an insight into the value of collections, to extend his ideas by the study of the comparatively rich Flora of his alma mater, and, above all things, to enjoy the inestimable advantage of having an experienced friend upon whose judgment he could rely. The year 1727-28, and the house of Stobæus, were beyond all doubt the time and place when Linnæus first formed that fixed determination of devoting himself to the study of natural history which neither poverty nor misery was afterwards able to shake. In 1728 he passed the vacation at home, and there formed the resolution of prosecuting his future studies at Upsal—a measure which for the time lost him the goodwill of his patron Stobæus. For the purpose of meeting the expenses of his academical education, his father was unable to allow him a larger annual sum than 8*l.* sterling; and with this miserable stipend he had the courage to plunge into the world. Nothing less than the most biting poverty could be the immediate result of such a measure; and we accordingly find Linnæus, for some time after this, in a state of miserable destitution, mending his shoes with folds of paper, trusting to chance for a meal, and in vain endeavouring to increase his income by procuring private pupils. No succour could be obtained from home, and it is difficult to conceive how he could have struggled with his penury without the slender aid afforded by a royal scholarship awarded him on the 16th of December, 1728. Nevertheless he diligently persevered in attendance upon the courses of lectures connected with his future profession—the more diligently perhaps because of his poverty; and by the end of 1729 the clouds of adversity began to disperse. By this time he had become known to Dr. Olaus Celsius, the professor of divinity at Upsal, who was glad to avail himself of the assistance of Linnæus in preparing a work illustrating the plants mentioned in the Holy Scriptures. His new friend procured him private pupils, and introduced him to the acquaintance of Rudbeck, the professor of botany, then growing old, who appointed him his deputy lecturer, took him into his house as tutor to his younger children, and gave him free access to a very fine library and collection of drawings.

Here the published writings of Linnæus were commenced. It was in the midst of the library of Rudbeck that he began to sketch those works which were afterwards published under the titles of 'Bibliotheca Botanica,' 'Classes Plantarum,' 'Critica Botanica,' and 'Genera Plantarum;' and to perceive the importance of reducing into brevity and order the unmethodical, barbarous, confused, and prolix writings with which he was surrounded. If, in the prosecution of a task of such imminent necessity, he fell into the opposite errors of attempting to make the language of natural history more precise than is possible from the nature of things, of reducing the technical characters of species and genera to a brevity which often proved a nullity, and of reforming the terminology till it became pedantic, there is no candid person who will not be ready to acknowledge that such errors were of very little importance when compared with the great good which the writings of Linnæus upon the whole effected.

In 1731 Linnæus quitted the house of Rudbeck, and on the 12th of May 1732 proceeded, under royal authority and at the expense of the University of Upsal, upon his celebrated journey into Lapland. On horseback and on foot he accomplished his object by the 10th of October following, when he returned to Upsal, after travelling, alone and slenderly provided, over nearly 4000 miles. The result of this expedition has been given in his excellent 'Flora Lapponica' and in the Swedish account of his tour, of which an English translation has been published. For some time after his return we find him occupied in teaching mineralogy, particularly the art of assaying; persecuted by the miserable jealousy of a certain Dr. Rosen, on whom he is said to have drawn his sword; and travelling in Dalecarlia at the expense of the governor. In the beginning of 1735 he had scraped together 15*l.*, with which he set out upon his travels in search of some university where he could obtain the degree of Doctor in Medicine the cheapest, in order that he might be able to practise physic for a livelihood. At Harderwijk, in Holland, he accomplished his purpose on the 23rd of June 1735, on which occasion he defended the hypothesis that "intermittent fevers are owing to fine particles of clay taken in with the food, and lodged in the terminations of the arterial system."

In Holland, Linnæus formed a friendship with Dr. John Burmann, BIOG. DIV., VOL. III.

professor of Botany at Amsterdam, and it was during his stay of some months with that botanist that he printed his 'Fundamenta Botanica,' a small octavo of 36 pages, which is one of the most philosophical of his writings. At that time he was introduced to Mr. George Clifford, a wealthy Dutch banker, possessing a fine garden and library at a place called Hartecamp. This gentleman embraced the opportunity of putting it under the charge of Linnæus, who continued to hold the appointment till the end of 1737, during which time he is said to have been treated with princely munificence by his new patron. His scientific occupations consisted in putting in order the objects of natural history contained in Mr. Clifford's museum, in examining and arranging the plants in his garden and herbarium, in passing through the press the 'Flora Lapponica,' 'Genera Plantarum,' 'Critica Botanica,' and some other works; and in the publication of the 'Hortus Cliffortianus,' a fine book in folio, full of the learning of the day, ornamented with plates, and executed at the cost of Mr. Clifford, who gave it away to his friends. Some idea may be formed of the energy and industry of Linnæus, and of his very intimate acquaintance with botany at this period of his life, by the fact that the book just mentioned, consisting to a great extent of synonyms, all the references to which had to be verified, was prepared at the rate of four sheets a week, a prodigious effort, considering the nature of the work, which Linnæus might well call "res ponderosa." He however seems to have possessed powers of application quite beyond those of ordinary men, and to have worked day and night at his favourite pursuits. In May 1737 he speaks of his occupations as consisting of keeping two works going at Amsterdam, one of which was the 'Hortus Cliffortianus,' already mentioned; another at Leyden, a fourth in preparation; the daily engagement of arranging the garden, describing plants, and superintending the artists employed in making drawings, which alone he calls "labor immensus et inexhaustus." (Van Hall, p. 12.) Linnæus however seems to have been weary of the life he led at Hartecamp, and towards the end of 1737 he quitted Mr. Clifford under the plea of ill health, and an unwillingness to expose himself again to the autumnal air of Holland. These however seem to have been only excuses, for he did not really quit the country before the spring of 1738, and in fact he was evidently tired of his drudgery. Good Mr. Clifford would scarcely allow him to leave the house, where Linnæus complains of being "in carceratus monachi instar cum duabus nunniis." It was during his engagement at Hartecamp that he visited England, where he seems to have been disappointed both at his reception and the collections of natural history which he found here. He was ill received by Dillenius, at that time professor of botany at Oxford, who was offended at the liberties Linnæus had taken with some of his genera; and although the quarrel was made up before his return to Holland, it seems to have discomposed the Swedish naturalist not a little. He describes the celebrated collection of plants formed by Sherard at Eltham as being unrivalled in European species, but of little moment in exotics. He found the Oxford garden in a like condition, but with the greenhouses and stoves empty; and the great collection of Sir Hans Sloane in a state of deplorable confusion and neglect. Dr. Shaw, the traveller in the Levant, seems to have pleased him most; and he, together with Philip Miller, the celebrated gardener to the Society of Apothecaries, Mr. Peter Collinson, and Professor Martyn the elder, were apparently the only acquaintances Linnæus succeeded in forming. By this means he acquired a considerable addition to his collections of plants and books. While in Holland he also induced Professor Burmann, in conjunction with five printers, to undertake the publication of Rumphius's important 'Herbarium Amboinense,' at an estimated cost of 30,000 florins.

Upon his return to Sweden, Linnæus commenced practice in Stockholm as a physician, and with the aid of a pension of 200 ducats from the government, on condition of lecturing publicly in botany and mineralogy, his prospects for the future became so satisfactory as to enable him to marry at Midsummer 1739. By this time his botanical fame had spread over all Europe; the importance of the critical improvements he had introduced into this and other departments of natural history had become generally acknowledged, and his new method of arranging plants by the differences in their stamens and pistils had been adopted in many countries, but not in Sweden. Impatient at receiving less honour in his own country than elsewhere, he wrote a book called 'Hortus Ageromensis,' arranged according to his system, which he passed off upon Rudbeck, at that time professor of botany at Upsal, as the production of his friend Rothmann, who however had no further hand in it than that of writing the preface, which was an eulogium of Linnæus and his new system of botany. The book was eventually published under the name of Ferber, and accomplished the object of the contrivers, for afterwards no other botanical arrangement was received in Sweden.

From this time forward the life of Linnæus was one of increasing fame and prosperity. Every branch of natural history was revised or remodelled by him; books and collections were sent to him from all parts of the world; his pupils Hasselquist, Osbeck, Sparmann, Thunberg, Kalm, Lofling, and others, communicated to him the result of their travels in Europe, Asia, Africa, and America. He was named Professor of Medicine at Upsal in 1740, and afterwards of Botany; in 1746 he received the rank and title of Archiater; in 1757

he was raised to the nobility, and took the title of Von Linné, and by the year 1758 he was able to purchase the estates of Hammarley and Sofja for 80,000 Swedish dollars (above 2330*l.* sterling).

During these eighteen years his life was one of incessant labour. Besides his practice as a physician, which was extensive and lucrative, and his duties as professor, he published a most extraordinary number of works on various branches of natural history. His works upon other branches of natural history were less important than those on botany, but they all evinced the same ingenuity in classification, and that logical precision which has rendered the writings of Linnæus so generally admired. In addition to a large number of dissertations, bearing the names of his pupils, and now collected under the title of 'Amoenitates Academicæ,' the 'Flora,' and 'Fauna Suecica,' 'Materia Medica,' edition after edition of the 'Systema Naturæ,' and numerous miscellaneous works, some of great importance, he produced his 'Philosophia Botanica,' and 'Species Plantarum'; the former, dictated from a sick bed, was the best introduction to botany that had been written, and is far superior to the numerous dilutions of it which subsequently appeared from the pens of his followers; the latter contributed more than any work which had before been seen to place the existing knowledge of plants in a clear and intelligible form; the invention of generic and specific names, by which every known plant could be spoken of in two words, was in itself a great step towards securing order and perspicuity in future botanical writings, and the methodical and concise arrangement of references rendered it invaluable, notwithstanding its omissions, as a catalogue of the plants at that time known. Viewed with reference to the existing state of knowledge, this book deserves all the praise which has been given it; and botanists have, as if by common consent, taken the second edition, which appeared in 1762, as the point of departure for systematic nomenclature. So great is the importance still attached to it, that an edition, chiefly consisting of it and the 'Genera Plantarum,' incorporated in the state in which they were left by Linnæus, was only a few years ago published under the name of 'Codex Botanicus Linnæanus,' collated by Dr. Hermann Eberhard Richter.

Towards the latter part of his life Linnæus suffered severely in health. Apoplexy succeeded repeated attacks of gout and gravel, and was followed in its turn by paralysis, which impaired his faculties, and at last he was carried off by an ulceration of the bladder, on the 10th of January 1778, in the seventy-first year of his age. "His remains were deposited in a vault near the west end of the cathedral at Upsal, where a monument of Swedish porphyry was erected by his pupils. His obsequies were performed in the most respectful manner by the whole university, the pall being supported by sixteen doctors of physic, all of whom had been his pupils." A general mourning took place on the occasion at Upsal, and King Gustavus III. not only caused a medal to be struck expressive of the public loss, but introduced the subject into a speech from the throne, regarding the death of Linnæus as a national calamity.

In the article BOTANY, in NAT. HISTORY DIV., we have already adverted to the effect produced by Linnæus upon that branch of science. His merit as a systematist is unquestionable; the clearness of his ideas, his love of science, his skill in abridging, abstracting, and recombining the undigested matter contained in the bulky tomes of his predecessors, and the tact with which he seized the prominent facts relating to all the subjects he investigated, enabled him to produce a complete revolution in botany, and to place it at a height from which it would never have descended had he been able to leave his genius and his knowledge to his followers. We by no means agree with those who look upon Linnæus as a mere namer of plants, for there is ample evidence in his writings that his mind soared far above the anility of verbal triflers; but he regarded exactness in language as a most important means to an end, especially in sciences of observation; and who is there to say that he was wrong? His systems of classification were excellent for the time when they were invented, although now worthless; and it is never to be forgotten that Linnæus regarded them merely as temporary contrivances for reducing into order the confusion he found in all branches of natural history. Perhaps he believed his sexual system of botany a near approach to perfection, and so it was as an artificial mode (and its great author regarded it as nothing more) of arranging the 6000 or 7000 species he was acquainted with; although it cannot be usefully applied to the vast multitudes of plants with which botanists are overwhelmed by the discoveries of modern travellers. He never attached the importance to it which has been insisted upon by his followers, who, unable to distinguish between the good and the evil of his works, have claimed unbounded respect for everything that bears the stamp of Linnæus. Neither are we disposed to admit the fairness of those critics who complain of the absence of physiological knowledge from the writings of Linnæus; it should be remembered that in his time very little was known upon the subject, and that of what did appear in the books of the day a great deal was not likely to attract the attention of a mind which valued exactness and precision above all other things. The most serious charge that Linnæus is open to is that of indecency in his language; and we are bound to say that there is truth in the allegation, and that the language of Linnæus is sometimes disgusting for its prurieny and coarseness.

The domestic life of Linnæus does not bear examination, for it is

well-known that he joined his wife, a profligate woman, in a cruel persecution of his eldest son, an amiable young man, who afterwards succeeded to his botanical chair. We may smile at the vanity which so often breaks out in the writings of Linnæus, and at the fidgety anxiety for fame which induced him to make use of Rothmann as his trumpeter in the trick of the 'Hortus Agerumensis,' but such an act as that we have mentioned forms a stain upon his escutcheon which no talent, however exalted, can wipe out.

After the death of the younger Linnæus his library and herbarium were purchased for the sum of 1000*l.* by the late Sir James Edward (then Dr.) Smith, and are now in the possession of the Linnæan Society of London.

(Pulteney, *Life of Linnæus*; Smith, in *Rees's Cyclopaedia*; Van Hall, *Epistole Linnæi*; Agardh, *Antiquitates Linnæanae*.)

* LINNELL, JOHN, portrait and landscape-painter, was born in London in 1792. Originally a pupil of John Varley the water-colour painter, he early commenced his professional career by painting, both in oil and water-colours, portraits as well as landscapes, which found places in the exhibitions of the Royal Academy, the British Institution, and that at Spring Gardens; but his pictures attracted little notice, and he was constrained to add miniature and engraving to the list of his occupations. Gradually however he worked his way, and for many years Mr. Linnell has held a high place among the artists "outside the Academy." As a portrait-painter his rank is a peculiar one. His canvass is always small, and he seldom paints much more than the head, while the colour is usually of a not very natural brown; but the countenance is always marked by decided, and generally an intellectual and very characteristic, expression, which is the more valuable, as an unusually large proportion of his sitters have been persons of political, scientific, or literary eminence. Up to 1847 portraits formed the larger portion of the pictures exhibited by him at the Royal Academy, his landscapes being for the most part sent to the British Institution, but since then Mr. Linnell has almost exclusively exhibited landscapes. Among the latest of his portraits was a very excellent one of Thomas Carlyle.

As a landscape-painter Mr. Linnell's position is also a well-defined one. His manner, founded on the older masters of the landscape art, is little like that adopted by any of the other popular living painters. Yet, though wearing somewhat of an old-world air, many of his landscapes have a very agreeable freshness and individuality—such of them at least as are painted directly from nature: in 'compositions' he is less at his ease. His best landscapes are usually representations of such scenery as may be found on the skirts of the woods and commons of our home counties. Especially is he strong in Surrey scenery, near Reigate, in which county he has for some years resided. Even when he paints, as he is fond of painting, a scriptural incident—like 'The Disobedient Prophet' (1854)—the scene is a faithful transcript of some pleasant spot in Surrey, with two or three figures in conventional costumes placed in the foreground. Among his later and more important landscapes may be mentioned the 'Windmill' and 'Heath Scene,' now in the Vernon Gallery; 'Sand Pits' (1849); 'Crossing the Brook' (1850); 'Woodlands' and 'Morning' (1851); 'The Sear Leaf' and 'Timber Waggon' (1852); 'The Village Spring' and 'Forest Road' (1853); 'A Country Road' (1855); and 'A Harvest Sunset' (1856). To which must be added the 'Eve of the Deluge' (1848), an extraordinary assemblage of gorgeous colours; 'The Return of Ulysses' (1849); 'Christ and the Woman of Samaria' (1850); and 'The Disobedient Prophet' (1854).

Mr. Linnell ranks among the most thoroughly English of our native landscape-painters, and it is no doubt this honest, homely, native character that has been the chief cause of the popularity of his landscapes. He is however a rich and admirable colourist, though in his fondness for autumnal glow he sometimes oversteps the modesty of nature. But all his works display great observation of nature and a broad and manly style of execution, wanting perhaps only a somewhat sharper touch and more diversified manner to win from the general public the hearty appreciation which is so liberally bestowed upon them by the artist's more select admirers.

* LINTON, WILLIAM, was born at Liverpool towards the close of the last century. Much of his childhood is said to have been spent with some relatives at the foot of Windermere, and there his fondness for scenery appears to have been nurtured. With a view to divert his thoughts from an early-formed wish to become a painter, the youth was placed in a mercantile office at Liverpool; but it being found that the intended purpose was not effected, and the mercantile prospects proving less advantageous than was anticipated, he was eventually removed from the office, and, after some hesitancy, permitted to proceed to London with a view to trying his fortune as a painter. A picture which he exhibited at the British Institution in 1819 of 'A Carpenter's Shop near Hastings' received much commendation; but the young artist soon found that his strength lay not in such homely scenes, though it was not till after he had made several tours to North Wales, the Highlands, &c., that he turned towards those classic lands where he was to find congenial themes for his pencil. Extending over several years, Mr. Linton made tours of greater or less duration in Italy, Greece, Sicily, Calabria, and Switzerland; and from those countries most of his grander works have been drawn. A list of a few of his more important pictures will show that

Mr. Linton has not feared to grapple with the most trying themes which can employ the landscape-painter's pencil. To begin with his British pictures—'The Vale of Keswick;' 'The Vale of Lonsdale;' 'Morning after a Storm—Linton, North Devon;' 'Corfe Castle' (1848), one of the most impressive representations of those noble ruins ever painted; and 'Lancaster' (1852), one of the latest of his larger English pictures, and in its way one of the finest pictures of the English school. Among the scenes from Greece and Italy, and other scenes eminent in history or poetry, which have most served to render him famous, are—the 'Italy' which forms a chief ornament of the Duke of Bedford's English collection at Woburn; 'Positano,' in the collection of the Earl of Ellesmere; 'The Temple of Fortune,' purchased by the late Sir Robert Peel; 'The Embarkation of the Greeks for Troy;' 'A Greek City, with the Return of a Victorious Armament;' 'Venus and Æneas before Carthage;' 'Ætna and Taormina;' 'The Lake of Lugano,' 1838; 'Corinth,' 1842; 'The Bay of Naples,' 1843; 'An Arcadian Landscape;' 'Jerusalem at the time of the Crucifixion;' 'The Ruins of Peatum;' 'Bay and Castle of Baia,' 1845; 'Athens,' 1847, painted about the same time as 'Corfe Castle,' and in the same grand style; 'Temple of Minerva at Rome,' 1850; 'Venice,' 1851; 'Ruins near Empulum,' 1852; 'A Mountain Town in Calabria,' 1853; 'The Tiber,' 1856.

Mr. Linton's landscapes are many of them on canvasses of the largest size, and are painted in the broadest and boldest manner, with perfect simplicity of treatment, but correct in drawing; clear, though sober even to sombreness, in colour; and with fine atmospheric effect, though without any atmospheric exaggeration or trickery. Over all is diffused an air of poetry almost epic in its severity, but in strict accordance with the elevated character of the scenes and subjects. This very elevation and severity of style however, combined with an entire absence, indeed almost ostentatious contempt, of everything approaching to minute finish, have served to prevent Mr. Linton from ranking along with the popular painters of the day. Among the gaudy and glittering canvasses which cover the walls of the annual exhibitions such pictures as Mr. Linton's are little likely to attract the general eye, while in the public galleries, where their sterling merits would speedily ensure their appreciation, they find no place. Had Mr. Linton painted such pictures as many of those we have enumerated either in France or Germany they would have been at once purchased for a national gallery; here, till there is a really national collection formed, Mr. Linton must rest content to find admirers fit though few, and remain comparatively unknown to the bulk of his countrymen. Being a member of the Society of British Artists, Mr. Linton has of course received no academic distinctions.

LIPPI, FRA FILIPPO, a celebrated Italian painter and one of the most distinguished of the 'Quattrocentisti,' was born at Florence in 1412. He was the son of Tommaso Lippi, who died when Filippo was only two years of age. His mother died soon after he was born, and he was brought up by his father's sister Mona Lappaccia, until he was eight years old, when she placed him in the Carmelite convent Del Carmine, to commence his novitiate. Here he showed such a strong disinclination for study and so great a propensity for scribbling figures and other objects in his books, that the prior came to the wise conclusion of having him educated for a painter, then an occupation not in the least inconsistent with the assumption of a monastic life. Filippo was accordingly permitted daily to visit Masaccio, who was then employed in painting the chapel of the convent, and he took extreme delight in contemplating the works of Masaccio there. Filippo himself gave early evidence of his extraordinary ability, by a fresco of the papal confirmation of the rules of the order of the Carmelites, painted near a work by Masaccio, in the cloister of the convent, but both are now destroyed; he executed also several other works in various parts of the convent and in the church Del Carmine, each work superior to its preceding, and so like those of Masaccio that his spirit was said to have passed into Filippo. All these works however, or at least what remained of them, were destroyed in the conflagration of the church in 1771.

In 1430, or when only seventeen years of age, Filippo gave up the monastic life, left the convent Del Carmine, and went to Ancona. Here, while on an excursion of pleasure at sea with some other young men, he was captured by a pirate and carried in chains to Africa, and there sold as a slave. Eighteen months after the commencement of his captivity he amused himself one day with drawing, from memory, his master's portrait in chalk upon a white wall. The performance appeared to his master a sort of prodigy; he immediately released Filippo from his captivity, and after he had employed him to execute various pictures for him, sent him back safe to Italy. Filippo was landed in Naples, where he was, probably shortly after his arrival, employed by Alfonso duke of Calabria, afterwards Alfonso I. of Naples, to paint a picture for the chapel of the Castell' Nuovo, then in his possession, which would fix the date at about 1435, or five years from the time that Filippo left his convent. He remained only a few months in Naples, and then returned to Florence; and one of the first works which he executed at this time was a small picture of the 'Adoration of the Madonna,' for the wife of Cosmo de' Medici, which is now in the Imperial Gallery at Florence.

Fra Filippo executed many excellent works at Florence, Fiesole, Arezzo, and at Prato. While engaged in 1459 in the convent of Santa

Margherita, in the last-named place, he seduced and carried off a young Florentine lady, Lucrezia, daughter of Francesco Buti, who was being educated at the convent; and he had a son by her called Filippino Lippi, who became likewise a celebrated painter. 'The Death of San Bernardo,' painted for the cathedral of Prato, is one of Lippi's finest works; it is in oil and on panel, and is still in the cathedral. The passages also from the lives of John the Baptist and St. Stephen, painted in fresco, in the choir of the same church, from 1456 to 1464, the figures of which are colossal, are among the best works of the 15th century: Vasari terms the martyrdom of St. Stephen his masterpiece. Filippo has introduced his own portrait into this piece, and he has painted that of Lucrezia Buti as Herodias in one of the series from the life of the Baptist. These frescoes have been restored by a painter of Prato of the name of Marini.

Fra Filippo died at Spoleto in 1469, aged fifty-seven; this is no doubt the correct age of Filippo, though Vasari, who is followed by Baldinucci, makes him to have been sixty-seven. But that the year of his death was 1469, was ascertained by Baldinucci in the Necrology of the Carmelites. But Baldinucci and all other writers have overlooked the value of the evidence connected with Masaccio, and have assumed 1400 to be about the time of Filippo's birth, whereas Masaccio himself was born only in 1402.

Fra Filippo is said to have been poisoned by the relations of Lucrezia Buti; Lanzi speaks of the fact as certain, but Vasari merely alludes to it as a vague report, which is the more probable version, especially as his death also did not take place until eleven years after the abduction of Lucrezia, for Filippino was ten years old when his father died. Fra Filippo was buried at Spoleto, in the cathedral, which he was engaged in painting at the time of his death. His son was instructed in painting by Filippo's pupil and assistant Fra Diamante. He afterwards erected a marble monument, with a Latin inscription by Politian, to his father in the cathedral of Spoleto, by the order and at the expense of Lorenzo de' Medici.

Fra Filippo excelled in invention, in drawing, in colouring, and in chiaroscuro, and for his time was certainly a painter of extraordinary merit; he must, even without reference to time, be counted among the greatest of the Italian painters from Masaccio to Raffaello, both inclusive. Some of his easel pictures in oil are finished with extreme care and great taste; there are a few in the gallery of the Florentine Academy, of which the 'Coronation of the Virgin,' formerly in the church of Sant' Ambrogio, is an admirable work. There are some chalk studies of hands by Filippo in the British Museum. Several of his works have been engraved by Lasinio.

FILIPPINO LIPPI, though not equal to his father in the higher qualities, surpassed him in others, especially in general accessories, which he was perhaps the first to bestow great attention upon, and he had much more taste than most of his contemporaries; he understood better the rendering of mere appearances, one of the most essential, though not one of the highest qualities in pictorial art. He excelled in painting Madonnas; but his chief works are the frescoes of the Strozzi Chapel, in Santa Maria Novella, and of the Brancacci Chapel of the Carmine, where, besides others, he painted 'Peter and Paul before the Proconsul,' which was long attributed to Masaccio, as in the 'Etruria Pittrice,' where it is engraved, and in many other works. He died in 1505, aged forty-five.

(Vasari, *Vite de' Pittori*, &c.; and the Notes to the German Translation by Schorn; Baldanzi, *Delle Pitture di Fra Filippo Lippi nel Coro della Cattedrale di Prato*, &c.; Baldinucci, *Notizie dei Professori del Disegno*, &c.; Rumohr, *Italianische Forschungen*; Speth, *Kunst in Italien*; Gage, *Carteggio inedito d'Artisti*, &c.)

LIPSIUS, JUSTUS, was born at Ique, a village between Brussels and Louvain, on the 18th of October 1547. He was educated at Brussels, Cologne, and Louvain, and at the age of nineteen published 'Varie Lectiones' of some of the principal Roman authors: this work was so highly esteemed by his learned contemporaries, that he was received with distinguished honour at Rome, whither he went in the same year, by the Cardinal Granvelle and Pope Pius V. After remaining two years at Rome he was appointed professor of history at Jena, where he resided till 1574. In 1579 he was appointed professor of history at Leyden, and took an active part in the ecclesiastical disputes of the times. During his residence at this place he professed the Reformed religion, but on quitting Leyden in 1591 he returned to the Roman Catholic Church, in which he had been brought up, and published two treatises in defence of the worship of saints and their miraculous powers. ('*Divæ Virgæ Hallensis*,' 1604; '*Divæ Virgæ Sicheimensis*,' 1605.) He was afterwards professor of history at Louvain, where he remained till his death March 24th, 1606.

The works of Lipsius, which are very numerous, were collected and published at Antwerp in 1637, and also at Wesel in 1675: they consist of notes on the Latin authors, of which the commentary on Tacitus is the best, and is very useful; treatises on moral and political philosophy, and dissertations on Roman antiquities and historical subjects.

LISCOV, CHRISTIAN LUDWIG, born at Wittenberg in 1701, although very little known in this country, still ranks high in Germany for his satirical writings, which in their caustic irony show their author to have had a congenial turn of mind with Swift. Very few particulars of his life have been recorded, further than that about the year 1739 he was private tutor at Lübeck, where a pedant named Sievers

was the first who fell under the castigation of his pen. After this he became private secretary to Geheimrath von Blome, from which time nothing can be traced respecting him till he entered the service of Von Heinecker at Dresden. Under this accomplished and generous patron he might have passed his days in tranquillity, had not his love of ridicule prevailed over his prudence. Having offended the English minister at that court by some sarcasms, he drew upon himself the resentment of the all-powerful Count Bruhl, who caused him to be sent as a state-prisoner to Eilenburg, where he died shortly after, October 30th, 1760. Some however have questioned the truth of his having been in confinement.

Posterity has been more just to Liscov's merits than were his contemporaries. His satire was directed only against presumption and folly, and was besides far more general than personal, certainly impartial, and without any respect to persons, for a powerful offender was in his eyes no more than the meanest. That he possessed no ordinary ability for politics may well be conceived when we find Pott, the editor of a posthumous work of his, saying that had Count Bruhl listened to Liscov's advice, Germany would have been spared the Seven Years' War. The first complete edition of his works was published by Kriegerath Muehler, in 3 vols. 8vo, Berlin, 1806. Of several of these pieces the titles will convey some notion of the subjects: 'On the Excellence and Usefulness of Bad Writers'; 'On the Uselessness of Good Works towards Salvation'; and the 'Inaugural Discourse of the learned J. E. P., &c., at the Academy of Small Wits; together with the Reply of that eminent Society.' Liscov's own Apology for his satirical attacks is admirable.

LISLE, WILLIAM DE. [DE LISLE.]

LISTA Y ARAGON, ALBERTO, an eminent Spanish mathematician, poet, and critic, was born at Triana, a suburb of Seville, in 1775, on the 15th of October, the day which as he delighted to remember was also the birthday of his favourite poet Virgil. His parents were in humble circumstances, and engaged in silk-weaving, and in his early years Lista was himself obliged to work at the trade, but he soon displayed such talents for mathematics, that by the time he was thirteen he was already enabled to earn his own living by giving lessons to pupils. As he went about from one house to another for this purpose, he filled up the intervals by playing with the other boys in the streets. At fifteen he was made teacher of mathematics in the schools of the society of 'Amigos del Pais,' and at twenty nominated by the king to the same office in the nautical college of San Telmo at Seville. Before that time he had studied philosophy, theology, and canon law at the university, and he had also devoted himself to the priesthood. This however did not prevent him from engaging in private theatricals, and gaining applause in some of the principal characters in Lope and Calderon. At that period there were four young men in Seville enthusiastic in their devotion to literature and intimate personal friends, Arjona, Reynoso, Lista, and Don José Maria Blanco, afterwards so well-known in England by the name of Blanco White.

In 1808, soon after Lista's appointment to the professorship of poetry and rhetoric at the University of Seville, the French invasion brought ruin to every literary circle in the peninsula. Lista at first joined with Blanco in continuing the 'Semanario Patriótico,' begun by Quintana, but his firmness appears afterwards to have failed him. When the French entered Seville he remained, and while improvising patriotic odes on the victory of Baylen, he allowed himself to earn the compliments of Soult by the skill with which, under compulsion, he turned the French proclamations into excellent Spanish. The consequence was that when the French armies were driven out of the country in 1813, Lista found himself obliged to keep them company, and spent some years in France as a teacher of Spanish and also as a curate, occasionally venturing to preach in French, though he could never conquer the Spanish accent. In 1817 he was allowed to re-enter Spain, and after passing a few years in the provinces as a teacher of mathematics, was established in 1820 at Madrid as, in conjunction with Hermosilla and Miñano, editor of the magazine 'El Censor,' one of the best periodicals Spain has ever produced. In 1822 he published his poems with a dedication to Blanco White, under the name of 'Albino.' They at once placed their author among the first poets of modern Spain. Not long after he established a sort of private college at Madrid, the reputation of which rose singularly high, and had the effect of exposing him to many annoyances on the part of the government. Among the pupils of Lista at different periods of his life are found the names of Duran, Espronceda, Ventura de la Vega, Roca de Togores, and many others of peninsular eminence. He became so dispirited at the obstacles thrown in his way by the authorities, that he finally left the country and established himself at Bayonne, where he published a 'Gaceta de Bayona' in Spanish, which supported him by its circulation in Spain till it was prohibited by the ministry. He then went to reside at Paris, and while there paid a visit of a fortnight to London for the exclusive purpose of renewing his intercourse with his old friend White, then a minister of the Church of England, resident at Oxford. When the friends met their emotion was so great that both were for some time unable to speak. Soon after, in 1833, the writer, whose 'Gaceta de Bayona' had been forbidden to enter Spain, was summoned home to edit the 'Gaceta de Madrid,' where his leading articles were so highly approved, that King Ferdinand offered him in recompense the bishopric of Astorga,

which he declined in favour of his friend Torres Amat, the biographer of Catalan authors. From this time his life flowed through a series of honours. When in 1837 he resigned the editorship of the 'Gazette,' he became professor of mathematics at Madrid, and helped to establish the 'Athensum,' or university there. His health suffered by the climate of Madrid, and he removed to Cadiz, where he superintended the new college of St. Philip Neri. In 1840 he gave this up, and returned to his native Seville, on his road to which he was met at two leagues off by a procession of friends and admirers to escort him in. He again accepted in his old age the professorship of mathematics in the city where his early triumphs had been won, and there he died on the 5th of October 1848. The municipality of Seville decreed that one of the streets in which he had often played when a boy should bear henceforth the name of 'Calle de Don Alberto Lista.'

Lista was an author of very various merit, his 'Tratado de Matemáticas puras y mixtas' is the standard book on mathematics in Spain, and his amorous and anacreontic poetry is considered little inferior to that of the admired Melendez. His philosophic poems in the style of Horace are peculiarly happy, and his sacred poems are superior to those of any of his contemporaries. As a literary critic his 'Lecciones de Literatura dramática Española' (Madrid, 1839), and his 'Ensayos literarios y criticos' (2 vols., Seville, 1844) are in high esteem, and contain a fund of valuable information for foreigners; and he has also displayed his intimate acquaintance with the literature of his country in an excellent collection of selected extracts, 'Trozos escogidos de los mejores hablistas Españoles en prosa y verso.' A translation of Ségur's French work on universal history, which he executed when in France, has a title to be mentioned from the numerous additions it contains, including among others, a history of Spain to a late period. As a political writer he was distinguished by his advocacy of moderate and cautious reforms; and it should be mentioned that among his poems is one entitled 'The Triumph of Tolerance,' directed against the Inquisition.

* LISTER, JOSEPH JACKSON, a merchant in London, eminent for his knowledge of mathematics and the science of optica. Mr. Lister is one of that band of distinguished men who, although engaged in commercial pursuits, upheld the honour of England in the culture and pursuit of those branches of natural science which are almost wholly neglected in our universities. Mr. Lister is a member of the Society of Friends, and from an early period of his life was attached to the study of natural history. This led him to the use of the microscope. At that time, on account of the imperfect construction of the lenses, compound microscopes were scarcely ever employed for purposes of observation. The lenses were however gradually improved by M. Lelligues, Mr. Tulley, and Professor Amici, so as to correct to a certain extent the chromatic and spherical aberrations which had hitherto prevented the use of this more powerful form of the microscope. The arrangements made were however of an entirely practical nature, and several eminent mathematicians, as Sir John Herschel, Professor Airy, Professor Barlow, and Mr. Coddington, attempted to solve the difficulty. It was at this time that the subject occupied the attention of Mr. Lister. Being practically acquainted with the microscope, and possessing the necessary mathematical knowledge, he succeeded in forming a combination of lenses which proved perfectly achromatic, and possessed the great quality of a sufficient aperture to admit of observation over a very considerable field. The results of his investigations were published in the 'Philosophical Transactions' for the year 1829. [MICROSCOPE, in ARTS AND SCIENCES DIV.]

It has been allowed by all engaged in microscopic investigation, that this paper laid the foundations of a perfect microscope, and led to the unparalleled series of discoveries which has been made since that period by its use. Although Mr. Lister has not published anything further on the structure of this instrument than the paper referred to, he has been unceasing in his efforts to perfect its construction. He has accordingly rendered his aid to the great London makers, and these English instruments have a perfection that it seems almost impossible to improve, as the execution of the instrument equals its theoretical possibility. It is of very few human instruments that this can be said, and it is undoubtedly owing to that rare combination of theoretical knowledge and practical skill possessed by Mr. Lister that this has been accomplished.

In the same modest manner has Mr. Lister made himself known as an observer as he had previously done as an inventor. In the 'Philosophical Transactions' for 1834 he published a paper 'On the Structure and Functions of Tubular and Cellular Polypt and Ascidias.' He here describes not only a new species but a new genus of Ascidian Mollusca; he however left it for others to give it a name, and Professor Wiegmann called it *Perophora Listeri*. It is the type of a very interesting group of the Ascidian Mollusca, and the late Professor E. Forbes, in his work on the British Mollusca, draws attention to Mr. Lister's description as distinguished for the "minute accuracy" with which it is drawn up. Mr. Lister was elected a Fellow of the Royal Society in 1832.

LITTLETON, THOMAS, was the eldest son of Thomas Westcote, of the county of Devon, Esq., by Elizabeth, the daughter and sole heiress of Thomas Littleton, or Luttleton, Luttelton, or Lyttelton (the last being the mode in which he himself appears to have written

it: see the extract from his will given below), of Frankley in Worcestershire, whose surname and arms he took. He was educated at one of the universities, and thence removed to the Inner Temple, where in due time he became one of the readers of that society: Sir Edward Coke mentions his reading on the statute 'Westm. 2, De donis conditionalibus.' He was appointed by Henry VI. steward or judge of the court of the palace or marshalsea of the king's household. On the 13th of May 1455, in the 33 Henry VI., he was made king's serjeant, and in that capacity rode the northern circuit as judge of assize. In 1454 he had a general pardon under the great seal, and two years after was in commission, with Humphrey, duke of Buckingham, and William Birmingham, Esq., to raise forces in the county of Warwick. (Collins, 'Peerage,' who gives as his reference, 'Pat.' 36, Hen. 6, p. 1, m. 7). In 1462 (2 Edward IV.) he received a general pardon from the crown, and was continued in his post as king's serjeant, and also as justice of assize for the same circuit. On the 26th of April 1466 (6 Edward IV.), Littleton was appointed one of the judges of the Court of Common Pleas, and rode the Northamptonshire circuit. About the same time he obtained a writ, directed to the commissioners of the customs for the ports of London, Bristol, and Kingston-upon-Hull, for the annual payment of 110 marks, to support his dignity, with 106s. 11½d. to furnish him with a furred robe, and 6s. 6d. more for another robe, called 'linura.' In the fifteenth year of the same he was created a knight of the order of the Bath. Sir Thomas Littleton married Joan, widow of Sir Philip Chetwin, of Ingestre, in the county of Stafford, one of the daughters and co-heiresses of William Burley, of Broomscroft Castle, in the county of Salop, Esq., with whom he had large possessions. By her he had three sons and two daughters: 1, William, ancestor of the Lords Lyttelton, barons of Frankley, in the county of Worcester; 2, Richard, to whom the 'Tenures' are addressed, an eminent lawyer in the reigns of Henry VII. and Henry VIII.; 3, Thomas, from whom were descended the Lord-Keeper Lyttelton, baron of Mounslow, in the reign of Charles I., and Sir Thomas Lyttelton, Bart., Speaker of the House of Commons in the reign of William III. His two daughters, named Ellen and Alice, both died unmarried. (Collins's 'Peerage,' vol. vii., p. 424).

Littleton died at Frankley on the 23rd of August 1481, aged about sixty, and was buried in Worcester Cathedral, where his tomb bore the following inscription:—"Hic jacet corpus Thome Littleton de Frankley, Militis de Balneo, et unus Justiciarorum de Comuni Banco, qui obiit 23 Augusti, Ann. Dom. MCCCLXXXI."

In Collins's 'Peerage' there is a copy of Sir Thomas Littleton's will, "faithfully copied from the original remaining in the Prerogative Office." It contains some curious particulars; but we can only make room for the following extract from its commencement:—

"In the name of God, Amen. I, Thomas Lyttelton, Knight, oon of King's justice of the common place, make my testament, and notifie my wille, in the manner and forme that followeth. First, I bequeth my soul to Almighty God, Fader, Sonne, and Hollye Ghost, three Persons and oon God, and our Lorde, maker of heven and erth, and of all the worlde; and to our most blessed Lady and Virgin, Saynt Mary, moder of our Lord and Jesu Christ, the only begotten Sonne of our saide Lorde God, the Fader of heven, and to Saint Christopher, the which our saide Lorde did trusts to bere on his shouldres, and to all the saints of heven; and my body to be beried in the tombe I lete make for me on the south side of the body of the cathedrall-church of the monastere of our said blessed lady of Worcester, under an image of St. Christopher, in caas if I die in Worcestershire. Also, I wulle, and specially desire, that immediately after my decesse, myn executors finde three gode preests for to singe jii trentals for my soule, so that everich preest, by himself, sing oon trental, and that everich such preest have right sufficiently for his labor; also, that myn executors finde another gode preest for to singe for my soule fyve masses," &c. He then makes a provision for his two younger sons, willing that the "feoffees to myn use" of and in certain manors and lordships should "make some estates" unto his sons Richard and Thomas Lyttelton.

He appointed his three sons and "Sir Xtopher Goldsmyth, parson of Bromsgrove, Sir Robert Gank, parson of Enfield, and Robert Oxlyve," to be his executors. The will is dated at Frankley, 22nd of August 1481, being, as appears from the date of his death on his monument already quoted, the day preceding that of his death.

Sir Edward Coke has given it as his opinion that Littleton compiled his book of 'Tenures' when he was judge, after the reign of King Edward IV., but that it was not printed during his life; that the first impression was at Rouen, in France, by William de Taillier, 'ad instantiam Richardi Pinson,' the printer of Henry VIII., and that it was first printed about the twenty-fourth year of the reign of Henry VIII. In a note to the eleventh edition of Sir Edward Coke's 'Commentary,' it is remarked that this opinion is erroneous, because it appeared by two copies in the bookseller's custody that the 'Tenures' were printed twice in London in the year 1528, once by Richard Pinson and again by Robert Redmayne, and that was the nineteenth year of the reign of Henry VIII. It is observed that, to determine with certainty when the Rohan or Rouen edition was published, is almost impossible; but that from the old editions above mentioned it may be collected; not only that the Rohan impression is older than the year

1528, but also, by what occurs in the beginning and end of them, that there had been other impressions of the book in question. However it appears impossible, at this distance of time, to settle with accuracy when the first edition of Littleton's work was printed.

Littleton's work on English tenures is written in Norman French, divided into three books, and addressed to his son, for whose use it was probably intended. He says himself in the Tabula, in a note following the list of chapters in the first two books, "And these two little books I have made to thee for the better understanding of certain chapters of the 'Antient Book of Tenures.'" And after the Table of Contents of book iii. he thus concludes:—

"EPILOGUS.

"And know, my son, that I would not have thee believe that al which I have said in these books is law, for I will not presume to take this upon me. But of those things that are not law, inquire and learn of my wise masters learned in the law. Notwithstanding, albeit that certain things which are moved and specified in the said books are not altogether law, yet such things shall make thee more apt and able to understand and apprehend the arguments and reasons of the law, &c. For by the arguments and reasons in the law a man more sooner shall come to the certainty and knowledge of the law.

"Lex plus laudatur quando ratione probatur."

The circumstance above referred to of this treatise having been originally but a sort of introductory lesson "for the better understanding of certain chapters of the 'Antient Book of Tenures,'" may in part account for what has been often remarked respecting its defect in the accurate division and logical arrangement of the subject matter. The style however in which it is written is remarkably good. It combines the qualities of clearness, plainness, and brevity, in a degree that is not only extraordinary for the age in which its author wrote, but renders him superior, as to purity of style, to any writer on English law who has succeeded him. It is equally free from the barbarous pedantry and quaintness of Coke, and from the occasionally somewhat rhetorical manner of Blackstone.

Littleton very seldom quotes any authority for what he advances: indeed it was not the practice of the lawyers of his age to cite many authorities, even in arguments and opinions delivered in court. Littleton is a fair, or rather a favourable specimen of the mode in which the English lawyers, often with great acuteness and consistency, followed out all the consequences that might be logically deduced from certain principles or maxims, some of which maxims or premises being irrational and absurd, necessarily led to irrational and absurd conclusions. What with the alterations in and additions to the law since Littleton wrote, there is much of Littleton's book that is not now law; but from the absolute necessity of a knowledge of what was the state of the law with respect to property in land, in order to understand thoroughly what it now is, Littleton is still an indispensable book to the student of English law. But we are inclined to be of the following opinion, given in Roger North's 'Life of the Lord-Keeper Guildford':—"Coke's comment upon Littleton ought not to be read by students, to whom it is at least unprofitable; for it is but a common-place (book), and much more obscure than the bare text without it. And, to say truth, that text needs it not; for it is so plain of itself, that a comment, properly so called, doth but obscure it" (vol. i., p. 21). Coke's 'Commentary on Littleton' was no other than a sort of common-place book kept by Coke as a manual, in which he jotted down all his law and references to law as they occurred.

To put this 'Commentary,' or rather common-place book, into a student's hands to read as an institutional or elementary book, is evidently futile; and the doing so is probably the cause why so many students of English law break down at the very threshold of their career. The effect is, as North, or rather the Lord-Keeper Guildford, observed, "like reading over a dictionary, which never teacheth a language;" and therefore with him we may conclude that "certainly it is an error for a student to peruse such." (North's 'Life of Lord-Keeper Guildford,' vol. i., p. 21.) It is much better for the student who wishes to lay well the foundations of his professional knowledge to read Littleton without the comment (which of course he will find useful afterwards, when he wishes to examine any particular point very minutely); but then he must read slowly and carefully, and a little at a time; in short, very much as he would read Euclid, if he wishes to master it.

LIUTPRANDUS, or LUITPRANDUS, was a deacon at Pavia in the year 946, when Berengarius, marquis of Ivrea, and regent of the kingdom of Italy, sent him as his ambassador to Constantinople, where he learned the Greek language. After his return he was made bishop of Cremona. Otho I., emperor and king of Italy, sent him in 962 on a mission to Pope John XII.; and in the following year Luitprand accompanied Otho to the council held at Rome, which deposed John and chose Leo VIII. in his place. On that occasion Luitprand spoke to the council in the name of the emperor, who did not understand Latin, as he says in his 'Chronicle.' In 968 Otho sent him as ambassador to Nicephorus Phocas, emperor or usurper of Constantinople, who treated him very scurvily, and kept him as a kind of prisoner. After four months' residence in that capital, Luitprand left Constantinople in the month of October, to return to Italy. He died not long after at Cremona, but the precise year of his death is not ascertained.

He was a man of considerable learning for his age, and his works are valuable for the historical information which they contain. They consist—1, of a general history of Europe from the year 862 to the year 964, 'Rerum Gestarum ab Europæ Imperatoribus et Regibus, libri vi.' Luitprand gives among other things an account of the court of Constantinople at the time of his first mission, and of Basilus and his son Leo the philosopher. The work concludes with the council of Rome and the trial and deposition of John XII. 2, 'Legatio Luitprandi Cremonensis Episcopi ad Nicephorum Phocam.' This is a narrative of his second embassy to Constantinople, in which he describes Phocas in no very flattering colours. The work is very curious. Another work has been attributed to Luitprand, namely, 'De Pontificum Romanorum Vita,' but his authorship of it is very doubtful. The best edition of the works of Luitprand is that of Antwerp, 1640, 'Luitprandi Opera quæ extant,' with very copious notes, by Jerome de la Higuera and L. Ramirez de Prado, with a dissertation at the end on the Diptychon Toletinum.

LIVIA. [Augustus.]

LIVIVS, with his full name, LUCIVS LIVIVS ANDRONIVS, was the first person who introduced a regular drama upon the Roman stage. (Liv., vii. 2.) He is said to have been the slave and afterwards the freedman of M. Livius Salinator. The time and place of his birth are uncertain; but his first play was probably exhibited B.C. 240, in the year before Ennius was born. (Cic., 'Brut.' c. 18; 'De Senect.' c. 14; 'Tuscul.' i. 1; Gell., 'Noct. Attic.' xvii. 21.) We learn from Livy the historian, that he acted in his own pieces, and that after his voice failed him, in consequence of the audience frequently demanding a repetition of their favourite passages, he introduced a boy to repeat the words, while he himself gave the proper gesticulations. (Liv., vii. 2.) The fragments of his works, which have come down to us, are too few to enable us to form any opinion respecting them: Cicero says that they were not worth being read a second time. ('Brut.' c. 18.) They were however very popular at the time they were performed, and continued to be read in schools till a much later period. (Hor., 'Epist.' ii. l. 69-73.) The hymns of Livius were sung on public occasions, in order to avert the threatened anger of the gods. (Liv. xxvii. 37.) Festus informs us (under 'Scribas') that the Romans paid distinguished honour to Livius, in consequence of the success which attended their arms in the second Punic War, after the public recitation of a hymn which he had composed. Livius wrote both tragedies and comedies: they appear, if we may judge from their names, to have been chiefly taken from the Greek writers. The titles, which have been preserved, are—Achilles, Adonis, Ægisthus, Ajax, Andromeda, Antiope, Centauri, Equus Trojanus, Helena, Hermione, Ino, Lydius, Proteilaodamia, Serenus, Tereus, Teucer, Virgo.

LIVIVS, TITUS, the Roman historian, was born at Patavium (Padua), B.C. 59. We possess very few particulars respecting his life. He appears to have lived at Rome, and to have been on intimate terms with Augustus, who used, according to Tacitus ('Ann.' iv. 34), to call him a Pompeian, on account of the praises which he bestowed upon Pompey's party. He also appears to have superintended the studies of Claudius, who was afterwards emperor. (Suet., 'Claud.' c. 41.) He died A.D. 17, in his seventy-sixth year.

Livy's great work, which was originally published in 142 books, gave an account of the history of Rome, from the earliest period to the death of Drusus, B.C. 9. Of these books only 35 are now extant, namely, the first ten, which contain the history of the city to B.C. 293; and from the twenty-first to the forty-fifth inclusive, which commence with the second Punic War, B.C. 218, and continue the history to the conquest of Macedonia, B.C. 167. There also exist brief epitomes of the lost books, as well as of those which have come down to us, which have been frequently supposed, though without sufficient reason, to have been compiled by Florus. We have however only epitomes of 140 books; but it has been satisfactorily shown by Sigonius and Drakenborch, on Livy, 'Ep.' 136, that the epitomes of the 136th and 137th books have been lost, and that the epitome of the 136th book, as it is called, is in reality the epitome of the 133th. Many hopes have been entertained at various periods of recovering the lost books of Livy's original work; but they now appear to be irrevocably lost. Erpenius and others stated that there was a translation of them in Arabic; but such a translation has never been discovered. The fragments of the lost books, which have been preserved by grammarians and other writers, are given in Drakenborch's edition. That portion of Roman history which was contained in the lost books has been written in Latin by Freinshemius with considerable diligence, and has been published in the Delphin and Bipont editions, together with the extant books.

We have no means for ascertaining at what time the whole of the history was completed, though there are indications of the time in which some particular portions were written. Livy (i. 19) mentions the first shutting of the temple of Janus by Augustus after the battle of Actium, B.C. 29; whence we may conclude that the first book was written between this year and B.C. 25, when it was closed a second time. He must also have been engaged on the 59th book after B.C. 18, since the law of Augustus, 'De maritandis ordinibus,' passed in that year, is referred to in the epitome of the 59th book.

The fame of Livy appears to have been widely extended even during his life, if we may believe a story related by Pliny ('Ep.' ii. 3), and

repeated by Jerome, that a native of Cadix came to Rome with the sole object of seeing the great historian. Tacitus ('Ann.' iv. 34) and Seneca ('Suasor.' vii.) among the later Roman writers, speak in the highest terms of the beauty of his style and the fidelity of his history—praises which have been constantly repeated by modern writers. But while most will be ready to admit that his style is eloquent, his narrative clear, and his powers of description great and striking, it can scarcely be denied that he was deficient in the first and most important requisites of a faithful historian—a love of truth, diligence and care in consulting authorities, and a patient and painstaking examination of conflicting testimonies. "In reporting the traditions of the early ages of Rome," as Professor Malden has very justly observed, "he seems less desirous to ascertain the truth than to array the popular story in the most attractive garb. He is not so much an historian as a poet. As the history advances and the truth of facts is better ascertained, he is of course compelled to record them with greater fidelity; but still his whole work is a triumphal celebration of the heroic spirit and military glory of Rome." And to that everything else is sacrificed. (See an admirable summary of Livy's chief merits and defects as an historian by Professor Malden in his 'History of Rome,' published by the Society for the Diffusion of Useful Knowledge,' pp. 39-41.) "To his passion for extolling the military reputation of Rome" (we quote from Malden) "we owe the comparative neglect of the less popular and less ostentatious subjects of domestic history. Every war and triumph of which any memorial, true or false, existed, is scrupulously registered; but the original constitution of the state, the divisions of its citizens, their several rights, the contests between the orders, the constitution of the general or partial assemblies of the people, the powers of the magistrates, the laws, the jurisprudence, their progressive melioration; these are subjects on which our information is vague and scanty and ill-connected. It is evident that to the mind of Livy they possessed comparatively little interest; and that on these matters, to say the least, he did not exert himself to correct the errors or supply the defects of the writers who preceded him. He was satisfied if from a popular commotion he could extract the materials of an eloquent speech. It is a sufficient proof that on this most important portion of Roman history he was really ignorant, that with all his powers of language he does not convey clear and vivid ideas to the minds of his readers. Who has risen from the perusal of the early books of Livy with the distinct notion of a client or of an agrarian law?"

In addition to the history of Rome, Livy wrote several other works, which have not come down to us; amongst which Seneca ('Ep.' 100) mentions dialogues on historical and philosophical subjects, and Quintilian ('Inst. Orator.' x. 1), a letter to his son, recommending the study of Demosthenes and Cicero.

The best editions of Livy are those by Crevier, 1735-1740; Drakenborch, 1738-1746; Ernesti, 1804; Ruperti, 1817; Döring, 1816-1824; Kreyzig, 1823-1827; Alchowski, 1841, &c. His Roman History has been translated into most European languages; but we are not aware of any one which gives a faithful representation of the original work. The most esteemed are the translations in German by Wagner, 1776-1782, and Cilano, 1777-1779; in Italian by Niardi, 1875; and in French by Dureau de la Malle and Noel, 1810-1812 and 1824. There are English translations by Philemon Holland, 1600; Baker, 1797; and "a literal translation," which forms four volumes of Bohn's 'Classical Library.'

LOBEL, or LOBEL, MATTHEW, one of the founders of the science of systematic botany, was born in Flanders in 1558, travelled in various parts of the middle and south of Europe, and finally settled in England, where he became physician to James I. He is chiefly known now as the author of botanical works illustrated by great numbers of figures, of which there are above 2000 in his 'Plantarum Historia,' a folio work published at Antwerp in 1576, and still referred to by critical writers on systematic botany. But his name deserves mention more particularly as that of the first naturalist who devised the present method of arranging plants in their natural orders, rudely indeed, but with sufficient distinctness. In his 'Stirpium nova adversaria,' published in London in 1570, and dedicated to Queen Elizabeth, he expressly mentions *Gramineæ*, *Acori* (under which *Iridaceæ* and *Zingiberaceæ* are included), *Asphodeleæ*, *Serides* or *Cichoraceæ*, *Atriplices* or *Chenopodiaceæ*, *Brassicæ* or *Crucifereæ*, *Glaucis* or *Papaveraceæ*, *Labiata*, *Asperifolia*, *Leguminosæ*, and some others. Lobel died at Highbgate, near London, in 1616. The genus *Lobelia* was dedicated to him by Linnæus.

LOBO, JEROME, a native of Lisbon, entered the order of the Jesuits, and became professor in their college at Coimbra, whence he was ordered to the missions in India. He arrived at Goa in 1622, and after remaining there about a year he volunteered for the mission to Abyssinia. The sovereign of that country, whom Lobo calls Sultan Segued, had turned Roman Catholic through the instrumentality of Father Pæz, who had gone to Abyssinia in 1603. The connection between Abyssinia and Portugal had begun nearly a century before, when the Negus, or Emperor David, having asked the assistance of the Portuguese against the Moors of Adel, Don Christopher de Gama, one of the sons of the discoverer Vasco de Gama, was sent from India with 400 men to Abyssinia. [ALVAREZ, FRANCISCO.] Lobo sailed from Goa in 1624, and landed at Paté, on the coast of Mombaza, thinking of reaching Abyssinia by land. The empire of Abyssinia then extended

much farther south than it does at present; and this route was considered by the Portuguese in India as preferable to that by the Red Sea, the coasts of which were in the hands of the Turks. Lobo proceeded some distance from Paté to the northward among the Gallas, of whom he gives an account, but finding it impracticable to penetrate into Abyssinia by that way, he retraced his steps to the coast and embarked for India.

In the following year (1625) he sailed again with Mendez, the newly-appointed patriarch of Ethiopia, and other missionaries. This time they sailed up the Red Sea and landed at Belur, or Belal Bay (13° 14' N. lat.), on the Dancali coast, whose sheik was tributary to Abyssinia, and thence crossing the salt plain he entered Tigré by a mountain-pass and arrived at Fremona near Duan, where the missionary settlement was. Here Lobo remained the remainder of that year, after which the patriarch proceeded to the emperor's court, but Lobo remained in Tigré, where he spent several years as superintendent of the missions in that kingdom. A revolt of the Viceroy of Tigré, Tecla Georgis, put Lobo in great danger; for the rebels were joined by the Abyssinian priests, who hated the Roman Catholic missionaries, and indeed represented the protection given to them by the Emperor Segued as the greatest cause of complaint against him. The viceroy however was defeated, arrested, and hanged; and Lobo, having repaired to the emperor's court, was afterwards sent by his superiors to the kingdom of Damot. He here introduces in his narrative an account of the Nile and its sources, "partly," he says, "from what he had himself seen, and partly from what he had heard from the natives." His account coincides in the main with the subsequent observations of Bruce and others. From Damot, Lobo after some time returned again to Tigré, where the persecution raised by the son and successor of Segued overtook him. All the Portuguese, to the number of 400, with the patriarch, a bishop, and eighteen Jesuits, were compelled to leave the country in 1634. They put themselves under the protection of the Bahrnegash, by whom however they were given up to the Turks at Masowah, who demanded a ransom. Lobo was sent to India for the purpose, and he endeavoured strongly to persuade the Portuguese viceroy to send a squadron with troops to take possession of Masowah; but the viceroy had not the spirit, perhaps not the means, to follow his advice, and referred him to Lisbon. Lobo sailed for Europe; but, as he himself says at the end of his narrative, "never had any man a voyage so troublesome as mine, or interrupted by such a variety of unhappy accidents. I was shipwrecked on the coast of Natal, was taken by the Hollanders, and it is not easy to mention the dangers which I was exposed to both by land and sea before I arrived in Portugal." Portugal was then under the King of Spain, and Lobo was sent to Madrid, where he found still more indifference with regard to Abyssinian affairs than he had experienced at Goa. Still engrossed by his favourite idea, that of reclaiming Abyssinia to the Roman Catholic faith by means of Portuguese influence and arms, Lobo set off for Rome, but there also he found little encouragement.

In 1640 he returned to India, and became rector and afterwards provincial of the Jesuits at Goa. In 1656 he returned to Lisbon; and in 1659 he published the narrative of his journey to Abyssinia, under the title of 'History of Ethiopia,' which was afterwards translated into French by the Abbé Legrand, who added a continuation of the history of the Roman Catholic missions in Abyssinia after Lobo's departure, and also an account of the expedition of Poncet, a French surgeon, who reached that country from Egypt, and a subsequent attempt made by Du Roule, who bore a sort of diplomatic character from the French court, but was murdered on his way, at Sennar, in 1705. This is followed by several dissertations on the history, religion, government, &c., of Abyssinia. The whole was translated into English by Dr. Johnson in 1735. There had already appeared in 1675 a little work published by the Royal Society of London, said to be translated from a Portuguese manuscript, styled 'A Short Relation of the River Nile,' which is also found in Thévenot's collection, and the original of which is Lobo's. Many of the particulars coincide with those in the larger narrative. Lobo died at Lisbon in 1678. He was a man of abilities, enterprise, and perseverance, and altogether well qualified for the mission which he undertook.

LOCH, JAMES, was the eldest son of George Loch, Esq., of Drylaw, near Edinburgh, by a sister of the late Right Honourable William Adam. He was born in 1780, and called to the Scottish Bar in 1801; he was subsequently admitted within the English Bar. He was for many years auditor to the late Earl of Carlisle, and to the trust estates of the late Earl of Dudley, Viscount Keith, and also to the extensive properties of Lord Francis Egerton (now Earl of Ellesmere), and his brother the Duke of Sutherland, which he managed with great ability and success during the period when the tide of Highland emigration had set in at its strongest. The improvements which were made on the Duke of Sutherland's Highland property were the subject of much controversy; but Mr. Loch, in some able publications, demonstrated that the removal of wretched cottiers, without any means of cultivating the land, to make room for profitable industry, was real benevolence. He was also well known as the author of a 'Statistical and Historical Account of the County of Sutherland,' and as a member of the council of the University of London. He represented in the Liberal interest the since disfranchised borough of St. German's, Cornwall, during the last unreformed parliament, after which he sat for

the Wick district of Burghs from December 1832 to the dissolution in 1852, when he finally retired from parliament. He died in Albemarle-street, London, July 8th, 1855.

LOCK, MATTHEW, an English composer of great and deserved celebrity, was born in Exeter about 1635, and, as a chorister of the cathedral, was instructed in the elements of music by Wake the organist. He completed his studies under Edward Gibbons, a brother of the illustrious Orlando. The continuator of Baker's 'Chronicle' tells us that Lock was employed to write the music for the public entry of Charles II.; shortly after which he was appointed composer in ordinary to that king. His first publication was under the title of 'A Little Consort of Three Parts, for Viols or Violins,' consisting of pavans, ayres, sarabands, &c.; the first twenty for two viols and a bass. In Playford's 'Catch that catch can' are glees, &c., by Lock, and among them that agreeable piece of vocal harmony, 'Ne'er trouble thyself about Times or their Turnings.'

Lock was the first English composer for the stage. He set the instrumental music in the 'Tempest,' as performed in 1673; and in the same year he composed the overture, airs, &c. to Shadwell's 'Psyche,' which he published two years after, with a preface betraying strong symptoms of that irascible temper which subsequently displayed itself in very glaring colours; first in a quarrel with the gentlemen of the chapel-royal; and next, in his opposition to a plan proposed for a great improvement in musical notation by the Rev. Thomas Salmon, A.M., of Trinity College, Oxford. The abusive and bitter terms in which he expressed himself in a pamphlet, entitled 'Observations on a late Book called an Essay,' &c., which is an answer to Salmon's proposal, are at once a distinct proof of Lock's uncontrolled violent disposition, and either of his utter incapability of justly estimating a plan which would have proved highly beneficial to the art, or of his selfishness in opposing what he may have thought likely to militate against his personal interests. His resistance, backed by his prejudiced brethren, was unfortunately successful, and an opportunity was lost of accomplishing with ease that which every year's delay renders more difficult to effect, though ultimately, and at no distant period, the amelioration suggested by the above-named mathematician, or a still more complete and decided one, will be forced on the professors of music.

Lock contributed much to the musical publications of his day. His sacred compositions, some of which appear in the 'Harmonia Sacra,' and in Boyce's 'Collection of Cathedral Music,' are quaint, though they show that he was a master of harmony. But his 'Music in Macbeth,' a work evidencing at once great creative power and ripened judgment, is that on which his fame was built, and which will float his name down the stream of time. Lock died in 1677, having a few years before become a member of the Roman Catholic Church. As a consequence of his conversion, he retired from the king's service, and was appointed organist to the consort of Charles, who was of the communion adopted by the composer.

LOCKE, JOHN, was born at Wrington near Bristol, on the 29th of August 1632. By the advice of Colonel Popham, under whom Locke's father had served in the parliamentary wars, Locke was placed at Westminster School, from which he was elected in 1651 to Christ-church, Oxford. He applied himself at that university with great diligence to the study of classical literature; and by the private reading of the works of Bacon and Descartes, he sought to acquire that aliment for his philosophical spirit which he did not find in the Aristotelian scholastic philosophy, as taught in the schools of Oxford. Though the writings of Descartes may have contributed, by their precision and scientific method, to the formation of his philosophical style, yet, if we may judge from the simply controversial notices of them in the 'Essay concerning Human Understanding,' they appear to have exercised a negative influence on the mind of Locke; while the principle of the Baconian method of observation gave to it that taste for experimental studies which forms the basis of his own system, and probably determined his choice of a profession. He adopted that of medicine, which however the weakness of his constitution prevented him from practising.

In 1664 Locke visited Berlin as secretary to Sir W. Swan, envoy to the Elector of Brandenburg; but after a year he returned to Oxford, where he accidentally formed the acquaintance of Lord Ashley, afterwards Earl of Shaftesbury. Locke accepted the invitation of this nobleman to reside in his house; and from this time he attached himself to his fortunes during life, and after death vindicated his memory and honour. ('Mémoires pour servir à la Vie d'Antoine Ashley, Comte de Shaftesbury, tirées des Papiers de feu M. Locke, et redigées par Le Clerc, Biblioth. Choisie,' t. vii. p. 146.) In the house of Shaftesbury Locke became acquainted with some of the most eminent men of the day, and was introduced to the Earl of Northumberland, whom, in 1668, he accompanied on a tour into France. Upon the death of the earl he returned to England, where he again found a home in the house of Lord Ashley, who was then chancellor of the Exchequer, and Locke was employed to draw up a constitution for the government of Carolina, which province had been granted by Charles II. to Lord Ashley with seven others.

In 1670 Locke commenced his investigations into the nature and extent of the human understanding, but his numerous avocations long protracted the completion of his work. In 1672, when Ashley was

created Earl of Shaftesbury and made lord chancellor, Locke was appointed secretary of presentations. This situation he held until Shaftesbury resigned the great seal, when he exchanged it for that of secretary to the Board of Trade, of which the earl still retained the post of president.

In 1675 Locke was admitted to the degree of Bachelor in Medicine, and in the summer of the same year visited France, being apprehensive of consumption. At Montpellier, where he ultimately took up his residence, he formed the acquaintance of the Earl of Pembroke, to whom he afterwards dedicated his 'Essay concerning Human Understanding.' In 1679 Locke was recalled to England by the Earl of Shaftesbury, who had been restored to favour and appointed president of the council. Six months afterwards however he was again disgraced, and, after a short imprisonment in the Tower, was ultimately compelled to leave England in 1682, to avoid a prosecution for high treason. Locke followed his patron to Holland, where, even after the death of Shaftesbury, he continued to reside; for the hostility of the court was transferred to Locke, and notwithstanding a weak opposition on the part of the dean, his name was erased, by royal mandate of the 16th of November 1684, from the number of the students of Christchurch. But the rancour of the court party extended its persecution of Locke even into Holland, and in the following year the English envoy demanded of the States-General the delivery of Mr. Locke, with eighty-three other persons, on the charge of participating in the expedition of the Duke of Monmouth. Fortunately Locke found friends to conceal him until either the court was satisfied of his innocence or the fury of persecution had passed away. During his residence in Holland he became acquainted with Limborch, Leclerc, and other learned men attached to the cause of free inquiry, both in religion and politics. Having completed his 'Essay concerning Human Understanding' in 1687, he made an abridgement of it, which was translated into French by Leclerc, who inserted it in one of his Bibliothèques. In that of 1686 he had already published his 'Adversarium Methodus, or a New Method of a Common-place Book,' which was originally written in French, and was afterwards first published in English among his posthumous works. In the 'Bibliothèque' of 1688 appeared his 'Letter on Toleration,' addressed to Limborch, which was soon translated into Latin, and published the next year at Gouda.

On the Revolution of 1688, Locke returned to England in the fleet which conveyed the Princess of Orange. In reward for his sufferings in the cause of liberty, Locke now obtained, through the interest of Lord Mordaunt, the situation of commissioner of appeals, with a salary of 200*l.* a-year. In 1690 his reputation as a philosophical writer was established by the publication of his 'Essay concerning Human Understanding,' which met with immense success. Independent of the merits of the work itself as an attempt to apply the Baconian method of observation and experience to establish a theory of human knowledge, many circumstances contributed to its success: among others, the personal celebrity of the author as a friend of civil and religious liberty, and the attempt made at Oxford to prevent its being read in the colleges, a measure which could not fail to have a contrary effect. Numerous editions passed rapidly through the press, and translations having been made of it into Latin and French, the fame of the author was quickly spread throughout Europe. In the same year Locke published a second letter on 'Toleration,' in answer to an attack on his first letter by Jonas Proast, a clergyman of Queen's College, Oxford, as well as two treatises on 'Government.' These essays were intended generally to answer the partisans of the exiled king, who called the existing government a usurpation, but particularly to refute the principles advanced in the 'Patriarcha' of Sir Robert Filmer, who had maintained that men are not naturally free, and therefore could not be at liberty to choose either governors or forms of government, and that all legitimate government is an absolute monarchy. The first essay is devoted to the refutation of the arguments by which Sir Robert supports these principles, and which are ultimately reduced to this, that all government was originally vested by God in Adam as the father of all mankind, and that kings, as the representatives of Adam, are possessed of the same unlimited authority as parents exercise over their children. In the second essay Locke proceeds to establish, what had been the leading dogma of the Puritans and Independents, that the legitimacy of a government depends solely and ultimately on the popular sanction or the consent of men making use of their reason to unite together into a society or societies. The philosophical basis of this treatise formed a model for the 'Contrat Social' of Rousseau.

The air of London disagreeing with Locke, who suffered from a constitutional complaint of asthma, he accepted the offer of apartments in the house of his friend Sir Francis Masham, at Oates in Essex, where he resided for the remainder of his life. In this retirement he wrote his third letter on 'Toleration,' which called forth a reply from Locke's former antagonist on the subject; in answer to whom a fourth letter, in an unfinished state, was published after the death of Locke. In 1693 he first gave to the world his 'Thoughts upon Education,' to which likewise Rousseau is largely indebted for his 'Emile.' Though appointed one of the commissioners of trade and plantations in 1695, Locke still found leisure for writing. The treatise, which was published in this year, 'On the Reasonableness of

Christianity,' was intended to facilitate the execution of a design which William III. had adopted to reconcile and unite all sects of professing Christians, and accordingly the object of the tract was to determine what, amid so many conflicting views of religion, were the points of belief common to all. This work being attacked by Dr. Edwards, in his 'Socinianism unmasked,' Locke published in defence of it a first and a second 'Vindication of the Reasonableness of Christianity,' &c. In 1697 Locke was again engaged in the controversy, in consequence of the publication of a 'Defence of the Doctrine of the Trinity,' by Stillingfleet, bishop of Worcester, in which the bishop had censured certain passages in the 'Essay concerning Human Understanding,' as tending to subvert the fundamental doctrines of Christianity. Against this charge Locke ably vindicated his Essay; and the controversy, after having been maintained for some time, was at length terminated by the death of Stillingfleet.

Locke's health had now become so impaired, that he determined to resign his office of commissioner of trade and plantations. He refused to receive a pension which was offered him, and which his services in the public cause had amply merited. From the time of his retirement he resided always at Oates, and devoted the remainder of his life to the study of the Holy Scriptures. Among others of his religious labours at this period, a 'Discourse on Miracles,' and 'Paraphrases, with notes, of the Epistles of St. Paul,' together with an 'Essay for the Understanding of St. Paul's Epistles by consulting St. Paul himself,' were published among his posthumous papers. These contained also the work, 'Of the Conduct of the Understanding,' and an 'Examination of Father Malebranche's opinion of Seeing all things in God.' He died on the 28th of October 1704, in the seventy-third year of his age, and was buried in the tomb of the Masham family at High Laver Church, where is a marble tablet, on the outside of the church wall, to his memory. The mansion of Oates, which was in High Laver parish, was pulled down several years ago.

The personal character of Locke was in complete harmony with the opinions which he so zealously and so ably advocated. Truly attached to the cause of liberty, he was also willing to suffer for it. Perfectly disinterested, and without any personal objects at stake in the political views which he adopted, he never deviated from moderation, and the sincerity of his own profession rendered him tolerant of what he believed to be the conscientious sentiments of others.

As a writer Locke was a happy facility in expressing his meaning with perspicuity in the simplest and most familiar language. Clearness indeed is the leading character of his composition, which is a fair specimen of the best prose of the period. His style however is rather diffuse than precise, the same thought being presented under a great variety of aspects, while his reasonings are prolix, and his elucidations of a principle occasionally unnecessarily prolonged. These are faults however which, though they may materially detract from the merits of his composition as a model of critical correctness, nevertheless greatly tended to make his 'Essay concerning Human Understanding' a popular work: though they must necessarily interfere with its permanent value.

A rapid analysis of this Essay is necessary to enable us to form a right estimate of the philosophical merits of Locke.

As all human knowledge ultimately reposes, both in legitimacy and extent, on the range and correctness of the cognitive faculty, which Locke designates by the term 'understanding,' Locke proposes to determine what objects our understanding is and is not fitted to deal with. With this view he proposes in the first place to inquire into the origin of ideas; in the next place, to show the nature of that knowledge which is acquired by those ideas, and its certainty, evidence, and extent; and lastly, to determine the nature and grounds of assent or opinion.

Before entering upon this investigation Locke gets rid of a supposition which, if once admitted, would render all such inquiry useless. The refutation of the theory of innate ideas and principles of knowledge is the subject-matter of the first book of the Essay. Generally, he observes, the common assent of men to certain fundamental principles may be explained otherwise than by the supposition of their being innate; and consequently the hypothesis is unnecessary. But, in particular, he denies that there are any such universal and primary principles as are admitted by all men, and known as soon as developed, for to these two heads he reduces all the arguments usually advanced in support of this hypothesis. Thus of speculative principles he takes the principles of contradiction and identity, and shows, by an inductive appeal to savages, infants, and idiots, that they are not universally acknowledged; and as to their being primary, he appeals to observation of the infant mind, as proving that they are far from being the first ideas of which the human mind is conscious. The principles of morals are next submitted to a similar examination; and lastly, he shows that no ideas are innate; for this purpose he selects the ideas of God and substance, which, by a like appeal to savage nations and children, he proves to be neither universal nor primary, and arrives at the conclusion that neither particular ideas nor general principles of knowledge or morals are antecedent to experience.

The only source of human knowledge is experience, which is twofold, either internal or external, according as it is employed about

sensible objects or the operations of our minds. Hence there are two kinds of ideas, ideas of sensation and ideas of reflection. Reflection might properly be called an internal sense. The latter are subsequent to the former, and are inferior in distinctness to those furnished to the mind through the sensuous impressions of outward objects. Without consciousness it is, according to Locke, impossible to have an idea; for to have an idea and to be conscious of it is the same thing. He accordingly maintains, at great length, against Descartes, that the mind does not always think, and that its essence does not consist in thinking.

Now all ideas, whether of sensation or reflection, correspond to their objects, and there is no knowledge of things possible except as determined by our ideas. These ideas are either simple, and not admitting of further reduction, or complex. The simple rise from the inner or outer sense; and they are ultimately the sole materials of all knowledge, for all complex ideas may be resolved into them. The understanding cannot originate any simple ideas, or change them, but must passively receive them as they are presented to it. Locke here makes the first attempt to give an analysis of the sensuous faculty, to refer to each of the senses the ideas derived from them separately, or from the combined operation of several. Thus light and colour are derived from vision alone, but extension and figure from the joint action of sight and touch. While the outer sense gives the ideas of solidity, space, extension, figure, motion, and rest, and those of thought and will are furnished by the inner sense or reflection, it is by the combined operation of both that we acquire the ideas of existence, unity, power, and the like. In reference to the agreement of ideas with their objects, Locke draws an important distinction between primary and secondary qualities: the former belong really to objects, and are inseparable from them, and are extension, solidity, figure, and motion; the latter, which are colour, smell, sounds, and tastes, cannot be considered as real qualities of objects, but still, as they are powers in objects themselves to produce various sensations in the mind, their reality must in so far be admitted. Of the operations of the understanding upon its ideas, perception and retention are passive, but discerning is active. By perception Locke understands the consciousness or the faculty of perceiving whatever takes place within the mind; it is the inlet of knowledge, while retention is the general power by which ideas once received are preserved. This faculty acts either by keeping the ideas brought into it for some time actually in view, which is called contemplation or attention, the pleasure or pain by which certain ideas are impressed on the senses contributing to fix them in the mind; or else by repetition, when the mind exerts a power to revive ideas which after being imprinted have disappeared. This is memory, which is, as it were, the storeroom of ideas. The ideas thus often 'refreshed,' or repeated, fix themselves most clearly and lastingly in the mind. But in memory the mind is oftentimes more than barely passive, the re-appearance of obliterated pictures or ideas depending on the will. Discerning, by which term he designates the logical activity of the intellect, consists in comparing and compounding certain simple ideas, or in conceiving them apart from certain relations of time and place. This is called abstraction, by means of which particular ideas are advanced to generals. By composition the mind forms a multitude of complex ideas, which are either modes, substances, or relations.

Locke then proceeds to show in detail how certain complex ideas are formed out of simple ones. The idea of space is got by the senses of sight and touch together; certain combinations of relations in space are measures, and the power of adding measure to measure without limits is that which gives the idea of immensity.

Figure is the relation which the parts of the termination of a circumscribed space have within themselves. He then proceeds to refute the Cartesian doctrine, that body and extension are the same; and maintains that while body is full space is empty, and that all bodies may easily pass into it; and while the latter is not physically divisible, that is, has not moveable parts, the parts of the former are moveable, and itself is physically divisible. What however space is actually, is left undetermined. He asserts the existence of a vacuum beyond the utmost bounds of body, and this is proved by the power of annihilation and the possibility of motion. The idea of succession arises from the perception of a continued series of sensations, and by observing the distance between two parts of the series we gain the idea of duration, which, when determined by a certain measure, suggests that of time; and as we arrive at the idea of immensity by the perception that we can enlarge any given extension without limit, so the unchecked repetition of succession originates that of eternity. That of power is formed partly by a perception that outward objects are produced and destroyed by others, partly by that of the action of objects on the senses, but chiefly from that of the mind's internal operations. The latter suggests the idea of active power, the former of passive. Now the will is the power of producing the presence or absence of a particular idea, or to produce motion or rest, and liberty is the power to think or not, to act or not to act, according as appears good to the mind. The will is determined by the understanding, which itself is influenced by a feeling of the unfitness of a present state, which is called desire.

As to the origin of the idea of substance:—we often find certain ideas connected together; and in consequence of this invariable asso-

ciation, we conceive of them as a single idea; and as the qualities which originate these ideas have no separate subsistence in themselves, we are driven to suppose the existence of a 'somewhat' as a support of these qualities. To this somewhat we give the name of substance, and relatively to it all qualities are called accidents.

Of the ideas of relation, those of cause and effect are got from the observation that several particulars, both qualities and substances, begin to exist, and receive their existence, from the due application and operation of some other being. In the same manner the ideas of identity and diversity are derived from experience. When we compare an object with itself at different times and places, and find it to be the same, we arrive at the idea of identity. Whatever has the same beginning in reference to time and place is the same, and a material aggregate which neither decreases nor lessens is the same; but in organic and living creatures, identity is determined not merely by the duration of the material mass, but by that of the organic structure and the continuance of consciousness. Lastly, moral good and evil are relations. Good and evil are nothing but that which occasions pleasure and pain; and moral good and evil are the conformity of human actions to some law whereby physical good or evil is produced by the will and power of the law-maker. Law is of three kinds: divine law, which measures sin and duty; civil, which determines crime and innocence; and philosophical, or the law of opinion or reputation, which measures virtue and vice.

Having thus examined the origin and composition of ideas, Locke proceeds to determine their general characters. He divides them accordingly into clear and obscure, distinct and confused, into real and fantastical, adequate and inadequate, and, lastly, into true and false. In treating of this last distinction, he observes that all ideas are in themselves true; and they are not capable of being false until some judgment is passed upon them, or, in other words, until something is asserted or denied of them. But there is also this property in ideas, that one suggests another, and this is the so-called association of ideas. There are associations of ideas which are natural and necessary, as well as arbitrary, false, and unnatural combinations. The danger of the last is vividly pointed out, which often arise from our having seen objects connected together by chance. Hence the association, which was originally purely accidental, is invariably connected in the imagination, which consequently biases the judgment. Hence too a number of errors, not only of opinion but of sentiment, giving rise to unnatural sympathies and antipathies which not unfrequently closely verge upon madness. This gives occasion to a variety of judicious observations on the right conduct of education, the means of guarding against the formation of such unnatural combinations of ideas, and the method of correcting them when once formed, and of restoring the regular and due associations which have their ground in the very nature of the human mind and its ideas. What however are the leading laws of association, Locke has not attempted to determine.

Before passing from this deduction of ideas to the examination of the nature and extent of the knowledge which is acquired by means of them, Locke devotes the third book of his 'Essay' to the investigation of language and signs, which it is not important for our purpose to state.

Locke then proceeds to determine the nature, validity, and limits of the human understanding. All knowledge, strictly defined, is the perception of the agreement or disagreement of ideas, and is consequently limited to them. It extends therefore only so far as we are able to perceive the validity of the combinations and relations of our ideas, that is, so far as we are enabled to discover them by intuition, demonstration, and sensation. Intuition, which Locke calls an immediate perception of relation, does not apply to all ideas; many must be proved by means of some intermediate ideas. This is the province of demonstration, every step of which however is an act of intuition. Demonstration again does not apply to the proof of all ideas, since in the case of many no middle ideas can be found by means of which the comparison may be made. Sensation is still more limited, being confined to what is actually passing in each sense. Generally, all knowledge directs itself to identity or diversity, co-existence, relation, and the real existence of things. Identity and diversity are perceived by intuition, and we cannot have an idea without perceiving at the same time that it is different from all others. With regard to co-existence our knowledge is unlimited; for our ideas of substances are mere collections or aggregates of certain single ideas in one subject; and from the nature of these single ideas it is impossible to see how far they are or are not combinable with others. Hence we cannot determine what qualities any object may possess in addition to those already known to us. As to the actual existence of things, we have no intuitive knowledge thereof, except in the case of our existence; that of God is demonstrative, but of all other objects we only sensuously know that they exist, that is, we perceive mediately by sensation their existence or presence.

Locke next passes to an examination of propositions, axioms, and definitions. The utility of axioms is denied on the ground that they are not the only self-evident propositions, and because equal if not greater certainty is contained in all particular identical propositions and limited cases. Moreover they do not serve to facilitate knowledge, for all particular propositions will find a more ready assent; as, for instance, the proposition, twice two are four, will be more easily

admitted than that the whole is equal to its parts. Moreover axioms are not useful for the proof of all lower propositions involved in them: they cannot consequently form the basis of any science. For example, no science has ever been raised on the basis of the principle of contradiction. They do not even contribute to the enlargement of knowledge; the false as well as the true may be proved by them, and consequently they serve at best but for endless dispute. Among those barren and unprofitable propositions, Locke reckons not merely those that are identical, but analytical also, or those in which a property contained in a complex idea is predicated of it. For example: every man is an animal. By such judgments or propositions we learn in fact nothing, and our knowledge is not increased in the least degree. Knowledge can only be extended by such judgments as predicate of a subject some quality or property which is not already involved in the idea of it. Synthetical propositions therefore are alone of value. In the next place he examines certain metaphysical problems, and concludes of most of them that they do not admit of any precise solution, while others might easily be set at rest if men would only come to the investigation of them free from all prejudices. Some very valuable remarks are added upon the sources of error, and on enthusiasm and faith, the due limits of which are pointed out, and the important truth repeatedly insisted upon, that reason is the ultimate test of revelation. The work concludes with a division of the object-matter of science or knowledge, which he makes to be three-fold:—1. Natural philosophy, or physica, which is the knowledge of things both corporeal and spiritual. The end of this is speculative truth. 2. Ethics, or practica, which is the skill of rightly applying our powers and actions for the attainment of things good and useful, the end of it being not bare speculation, but right, and a conduct suitable to it. 3. The doctrine of signs (*σημειωτική*), the business of which is to consider the nature of the signs which the mind makes use of for the understanding of things or the conveying of its ideas to others. This is the most general as well as the most natural division of the objects of the understanding. For man can employ his thoughts about nothing but either the contemplation of things for the discovery of truth, or about the things in his own power, which are his own actions for the attainment of his ends; or the signs which the mind makes use of in both, and the right ordering of them for its information.

Such is the celebrated Essay which has formed the basis of more than one school of modern philosophy, whose very opposite views may indeed find some support in the occasional variations and self-contradictions of its author. For it must be admitted that it is deficient in that scientific rigour and unity of view which preclude all inconsistency of detail. Nevertheless, rightly to appreciate Locke's philosophical merits, all contradictory passages must be neglected, or interpreted by the general spirit of his system. Attaching our attention then to the common mould and whole bearing of the Essay, we must conclude that the authority of Locke is unduly claimed by the followers of Condillac and the ideologists of France, whose object it was to approximate as closely as possible the rational thought and sensuous perception, and to explain the former as simply a result of the latter. For although Locke took in hand the defence of the sensuous element of knowledge, and, in opposition to Descartes and the idealists, endeavoured to show that in the attainment of science we set out from the sensible as the earlier and the better known, still he was far from denying that the rational thought, which is the perfection of human cognition, is really and truly distinct from the motions of the mind or soul occasioned by sensation. Setting out with the assumption of the permanence of ideas in the mind, Locke proceeds to illustrate the development of the particular into the general; and having then shown their difference from the unreal creations of the fancy, proceeds to determine their degree of verity. This description of the advance from the simple idea to universals and to knowledge, evidently implies an independent and spontaneous activity of the mind, which assents to the sensuous impressions, and confirms them by its conviction. Locke therefore is far from looking upon human science and knowledge as the simple results of the impressions produced by external objects on the senses. Nevertheless, there is another aspect of his theory which in some degree justifies the use which has been made of his name, and under which he appears to be proceeding in the direction of thought, of which the ideologists have attained to the height. Knowledge, as well as sensation, is looked upon as the joint result of the reciprocal action of outward objects and the mental faculties, where-in as much depends on the qualities of the external as on those of the internal. While he admits that assent is entirely subjective, he nevertheless grants that outward objects constrain it; and as a consequence of such a view, he teaches that notwithstanding the idea produced in the mind by an outward object be a passive affection of the mind, it nevertheless reveals to the mind its efficient cause; and that to this manifestation of outward objects by the senses there is invariably attached, as by a necessary consequence, the judgment that those objects exist really. It is therefore clear that, according to Locke, we receive from the senses not merely the object-matter of knowledge, but that likewise the forms under which we conceive of objects are furnished to the mind from the same source.

The works of Locke have been collected and frequently published

in 3 vols. fol., and a life of him was written in 1772; but the most complete and best edition is that in 10 vols. 8vo, London, 1801 and 1812. A Life of Locke was published in 1829 by the late Lord King, a lineal descendant of his sister.

* LOCKE, JOSEPH, M.P., civil engineer, whose name must hold a chief place in any record of the development of the railway system of communication during the last five and twenty years, in this country and on the continent, was born at Attercliffe, near Sheffield, in the year 1805, and was educated at the Grammar School at Barnsley in Yorkshire, from whence he was placed at Newcastle-on-Tyne under the late George Stephenson, the mechanical and civil engineer, for a term of five or six years. Towards the end of this period, or in the year 1826, the railway between Manchester and Liverpool was commenced—Mr. Stephenson being the chief engineer. Mr. Locke remained connected with the works of that line until the opening of the railway on the 14th of September 1830; and his services during the interval, in the experiments as to motive power, were especially valuable with reference to the selection of the particular means in that case, and the perception eventually of the full capabilities of the locomotive engine. Various opinions on the subject here referred to, had been entertained until shortly previous to the year 1830, when a pamphlet in the joint names of Mr. Robert Stephenson and Mr. Locke collated the results, and settled the question as to choice of motive power—though rope-traction was also used, and continued to be so, during some years in exceptional cases. But "easy gradients" were for some time deemed indispensable. Soon after the completion of the Manchester and Liverpool line, a project for a railway from its Warrington branch to Birmingham was revived, and the line was commenced in 1832 or 1833. Mr. George Stephenson at first was the engineer, but the line was eventually formed by Mr. Locke, and opened on the 6th of July 1837,—being then called the Grand Junction. Amongst the chief works on it were the Dutton and Vale Royal Viaducts; and improvements in the rails and fixing, by the use of the heavy double-headed rail and wooden key, were made. The chief importance of the undertaking as influencing the progress of railroads, however, was the important element, in such progress, of its commercial success. The line was constructed for a sum within the estimate, and at the cost of between 14,000*l.* and 15,000*l.* a mile.

These fortunate circumstances led to the investment of Lancashire capital in similar undertakings under Mr. Locke's direction, over the extended field of operations which has been alluded to. The Lancaster and Preston line was commenced in 1837, and was opened in 1840,—in which latter year the Sheffield and Manchester line was undertaken. Some time previous to the completion of the Grand Junction line, a railway from London to Southampton had been commenced. To this last Mr. Locke was eventually named the engineer; and his chief attention was given to the works, after the completion of the Grand Junction. The first section of the line from Nine Elms to Woking was opened on the 21st of May 1838; and the whole main line was completed on the 11th of May 1840,—since which period numerous branches have been added. Of the works on this South-western line, the Micheldever embankment, near Winchester, may be named as one of the principal: it is 90 feet in height. Economy in construction continued to be a characteristic of Mr. Locke's works.

Southampton had been long an important port for France; and after the completion of the last-named line numerous projects for continental lines were set on foot with Mr. Locke as engineer,—as for example, the Paris and Rouen, and Rouen and Havre lines, which he completed; one from Paris to Lyon, constructed under another engineer; and one for the Caen and Cherbourg line, which has been opened in this year (1856). For the Paris and Rouen line he received, in 1845, the decoration of the Legion of Honour from King Louis Philippe. Mr. Locke has also designed and superintended the line between Barcelona and Mattaro in Spain, and the Dutch Rhenish railway, of which the final portion was completed in 1856. During the construction of the works on the continental lines, Mr. Locke had joined with him as his coadjutor in professional practice, Mr. John Edward Errington; and together they constructed the Lancaster and Carlisle, the East Lancashire, the Caledonian, the Scottish Central, the Scottish Midland, and the Aberdeen railways, and the Greenock railway and docks. Notwithstanding the heavy works on the Caledonian line, it was constructed, with the platforms and roadside stations, for less than 16,000*l.* a mile. This economy of construction resulted from the bold adoption of lines of gradient far more steep than had before been held suitable for the powers of the locomotive engine; the result however allowed Mr. Locke to complete his proof of the possibility of saving in many cases, expenses which had been incurred under the idea of a radical defect, and consequent loss of power and time, in anything not approaching to a dead level.

Mr. Locke's early study of the locomotive engine led him to take great interest in the engine-works which were established at Crewe; and "the Crewe engine"—a system of construction in which each of the several parts of an engine is made with mathematical accuracy, and repeated in duplicate so as to fit indifferently any engine—was the result. Mr. Locke was returned to Parliament in the year 1847 for Houlton, of which he is lord of the manor. He is classed with liberals in politics. He is a Fellow of the Royal Society, and a vice-president of the Institution of Civil Engineers.

LOCKER, EDWARD HAWKE, was the son of Admiral Locker, to whom Nelson, soon after the battle of the Nile, thus wrote: "You, my old friend, after twenty-seven years' acquaintance, know that nothing can alter my attachment and gratitude to you. I have been your scholar. It is you who taught me to board a French man-of-war by your conduct when in the Experiment. It is you who always said, 'Lay a Frenchman close and you will beat him;' and my only merit in my profession is being a good scholar." The son, Edward Hawke, was born at East Malling, Kent, on the 9th of October 1777. He was educated at Eton, which he left in 1795, and received an appointment in the Navy Pay Office. He remained in government offices till 1800, when he went to India as private secretary to Lord Exmouth. From that time till the peace of 1814, he was associated with that distinguished commander in arduous and confidential duties, especially as secretary to the Mediterranean fleet; duties which he discharged with eminent ability. In his official capacity he visited Napoleon at Elba in May 1814; of which visit he published an interesting narrative after the death of the ex-emperor. In 1815 Mr. Locker married the daughter of an eminent antiquary and philologist, the Rev. Jonathan Boucher, the author of a 'Provincial Glossary,' the publication of which from the posthumous manuscript commenced in 1832, but which has not been continued beyond the letter B. Mr. Locker resided at Windsor from 1815 to 1819, when he was appointed secretary to Greenwich Hospital. During his residence at Windsor his attention was called to an article in 'The Windsor Express,' in which was pointed out the deplorable want of books adapted to the large class who had learnt to read under the new system of education in National and other schools. Mr. Locker sought the acquaintance of the writer of that article, Mr. Charles Knight, then the editor of the Windsor paper; and they together projected and jointly edited 'The Plain Englishman,' almost the first, if not the very first of any literary pretension, of those cheap and popular miscellanies which the growing ability of the great bulk of the people to read imperatively demanded, in the place of mischievous or childish tracts. Some very eminent friends of sound education, such as the present Archbishop of Canterbury, were among its contributors. Mr. Locker's own papers in the miscellany are excellent models of popular writing—plain, energetic, affectionate. His 'Lectures on the Bible and Liturgy,' which have been reprinted in a separate volume; 'Lectures delivered to the Crew of the Caledonia, Lord Exmouth's flag-ship,' are admirable examples of clear exposition and earnest exhortation. Mr. Locker, after filling for several years the important duties of secretary to Greenwich Hospital, became the Resident Civil Commissioner of that great institution. The improvements which he introduced into its management were results of his active and comprehensive mind. Of these improvements the Naval Schools are striking instances. Himself an accomplished draughtsman and an ardent lover of the arts, he founded the Naval Gallery at Greenwich by his judicious exertions. In 1844 Mr. Locker's health so failed that he gave up his valuable appointment and retired upon a small pension, his fine faculties overclouded beyond the hope of recovery. Mr. Locker was the intimate friend of many distinguished men amongst his contemporaries. To use Mr. Lockhart's expression, he was "an old and dear friend of Scott's." He died on the 15th of October 1849.

LOCKHART, JOHN GIBSON, was born in 1794 at the manse of Cambusnethan, in Lanarkshire, Scotland; his father, who was of an old Lanarkshire family, being then minister of the parish of Cambusnethan, in connection with the Established, or Presbyterian, Church of Scotland. His mother was related to the celebrated family of the Erskines. When Lockhart was two years of age his father removed from Cambusnethan to become one of the city clergymen of Glasgow; and here Lockhart was educated. His talents were shown during his course at the Glasgow University; at the end of which, while still only in his sixteenth year, he obtained, by the unanimous voice of the professors, the Snell exhibition to Balliol College, Oxford—a college at which, either on the same exhibition or otherwise, many eminent Scotchmen have been trained. In 1813 he took honours as a first-class man in classics; and in 1817 he graduated B. C. L. at the university—a degree exchanged for the higher one of D. C. L. in 1834. After residing some time in Germany, and acquiring the language and seeing much of the literary society there, he settled in Edinburgh as a member of the Scottish bar in 1816. He never had much practice as a lawyer however, but from the first devoted himself to literature, as a member of the little band of young Scotch Tories, who, with Wilson as their chief, were then beginning to dispute the literary supremacy of the Scotch Whigs, as represented by Jeffrey and the 'Edinburgh Review.' When Blackwood started his magazine in 1817, Wilson and Lockhart were its chief supporters; and considerable portions of the famous 'Chaldee Manuscript' and of the earlier 'Noctes Ambrosianae' papers were written by Lockhart, though Wilson afterwards made the magazine his own. It was in consequence of Lockhart's literary connection with 'Blackwood' and Scottish Toryism that he became acquainted with Scott, who looked with a kindly interest on the efforts of these young men of the same politics as himself. The first meeting of Scott and Lockhart took place in 1818, and from that time they were intimate friends. When Scott, from the pressure of other work, ceased to write the historical parts of the 'Edinburgh Annual Register,' he recommended Lockhart to the Ballantynes as his sub-

stitute. In 1819 Lockhart published anonymously his 'Peter's Letters to his Kinsfolk,' which gives such graphic accounts of Scottish men and manners at that time. In 1820 he married Scott's eldest daughter Sophia, and took up his abode at the cottage of Chiefswood, close to Abbotsford. Here perhaps he spent his happiest days; and few passages in Scott's 'Life' are pleasanter than those describing his walking over early in the morning to breakfast with the young couple at Chiefswood, or helping their servants on a summer afternoon, when they had a modest dinner-party, by drawing up the wine from the well into which it had been lowered to cool. This was also a prolific period in Lockhart's literary career. He wrote his translations of 'Spanish Ballads' for 'Blackwood,' afterwards published collectively; in 1821 he published anonymously his 'Valerius, a Roman Story,' in 3 vols.; this was followed in 1822 by 'Adam Blair, a Story of Scottish Life,' in 1 vol.; by 'Reginald Dalton, a Story of English University Life,' in 3 vols., 1823; and 'Matthew Wald,' in 1 vol., 1824, each showing great power in a peculiar vein; and in 1825 he wrote his 'Life of Burns,' and also a less-remembered 'Life of Napoleon,' for 'Constable's Miscellany.'

In 1826 Lockhart removed to London to succeed Gifford in the editorship of the 'Quarterly Review.' He continued to edit the 'Review' till 1853—with what success all the world knows. In his hands the 'Review' maintained and increased its reputation; and not a few of the most powerful articles that appeared in it during the seven-and-twenty years of his editorship, came from his own pen. He was particularly happy in biographical sketches, combined with criticism. One paper of this kind—that on 'Theodore Hook'—has been reprinted by itself.

On Scott's death in 1832, the task of writing his biography naturally devolved on his son-in-law Lockhart. The task was accomplished in 1837-39, when the voluminous 'Life of Scott' was given complete to the world. Those portions of the work which related to the fall of Scott's pecuniary fortunes, provoked some controversy at the time; but the work as a whole has now taken its place as one of the most interesting and admirable biographies in the language. It has been said by those who knew Lockhart, that such was his practical sagacity that, had his illustrious father-in-law had the benefit of his actual assistance in the management of his affairs, the catastrophe which ruined Scott towards the close of his life could certainly never have happened.

In 1843 Lockhart was appointed by Sir Robert Peel to the office of auditor of the Duchy of Cornwall, with a salary of 600*l.* a year; and as in addition to this and his large literary income, he had inherited some family property, he was in very easy circumstances. His last years however were embittered by a series of bereavements. His eldest son, the 'Hugh Littlejohn' of the 'Tales of a Grandfather,' had died in early life; his wife died in 1837; his second and only surviving son died at a later period; and there remained only one daughter. This lady, who was also (by the death of her eldest brother childless in India, that of the younger brother unmarried, and that of her sister) the sole remaining descendant of Sir Walter Scott, married in 1847 James Robert Hope, Esq., barrister-at-law, and is now proprietress of Abbotsford. Along with her husband she embraced the Roman Catholic faith. She usually lives at Abbotsford, and has one child, a daughter, born in 1852. Lockhart, broken in health and spirit, lived to see his own pedigree and that of Scott centered in this child—his granddaughter and Scott's great-granddaughter. Gradually becoming more shattered, he resigned the editorship of the 'Review,' and went to Rome in 1853; but he returned in the spring of 1854 and retired to Scotland. He died at Abbotsford, November 25, 1854, in the sixty-first year of his age. To the last he retained something of the handsome aristocratic appearance and bearing which had distinguished him in earlier life. His manners, always reserved, had become chillingly so before his death; but those who knew him intimately maintain that, beneath his morose and iron demeanour, his scornful smile and his withering sarcasm, there lay a host of qualities which commanded the thorough respect and affection of those whom he did admit to his friendship, or who were related to him by blood or affinity.

LODGE, THOMAS, is supposed to have been born about the year 1556. He was entered at Trinity College, Oxford, in 1573, took a degree, and then, going to London, became an actor and play-writer. About 1580, in an answer to Gosson's 'School of Abuse,' he wrote a 'Defence of Stage-Plays,' which was suppressed by authority, and is now one of the rarest of English books, only two copies being known. Another work of Lodge, his 'Alarum against Usurers,' which takes up incidentally the defence of the stage, was printed in 1584. In the same year he was a student of Lincoln's Inn. Afterwards, it has been conjectured, he became a soldier; and it is known that, in some capacity or other, he accompanied the expeditions of Clarke and Cavendish. According to the opinion most commonly received by the historians of our early literature, this flighty person went through yet another change; for he is usually identified with a Doctor Lodge, who took his degree in medicine at Avignon, printed in 1603 'A Treatise on the Plague,' and in 1616 obtained a passport from the Privy Council to "travel into the Archduke's country," and recover debts owing to him. Lodge is believed to have died of the plague in 1625.

He was a voluminous and versatile writer. He translated Josephus

and Seneca ('The Works of Josephus,' fol., Lond., 1602; 'Seneca's Works, both Moral and Natural,' fol., Lond., 1614); he wrote several novels, volumes of verses, and miscellaneous pamphlets; and he was a distinguished contributor to the drama in the years immediately preceding the appearance of Shakspeare. His extant dramatic works are two:—1. 'The Wounds of Civil War, lively set forth in the True Tragedies of Marius and Sylla,' 4to, 1594, reprinted in the last edition of Dodsley's 'Old Plays,' vol. viii.; a stately historical play, with some eloquence, much action, and little interest either of character or incident. 2. 'A Looking-Glass for London and England, made by Thomas Lodge, Gent., and Robert Greene, in Artibus Magister,' 4to, 1594, 1598, 1602, 1617; a whimsical but animated dramatic picture, alluded to already in our notice of Greene. [GREENE, ROBERT.] But Lodge's own exertions as a dramatist, although they entitle his name to a place beside those of Greene and Peele, are less interesting to us than the assistance which one of his works furnished to a greater than himself. One of his novels is entitled 'Rosalynde: Euphues Golden Legacie; found after his death in his cell at Silixedra. Bequeathed to Philantus Sonnes, nourished up with their Father in England. Fetcht from the Canaries;' 4to, 1590, 1592, 1620, 1623, 1642, &c.; reprinted in Mr. Collier's 'Shakspeare's Library,' 1840. From this novel Shakspeare borrowed closely the leading incidents (indeed many also of the minor ones), the grouping of the characters, and many of the strokes of portraiture, for his 'As You Like It.' While a perusal of the novel cannot diminish our admiration of the play, it is yet an agreeable duty. In the midst of much that is unskillful, somewhat that is dull, and a good deal in the bad taste of Lyly's Euphues, the novel is yet interesting, lively on the whole, and in many places finely poetical, both in its prose descriptions and narratives, and in the interspersed verses.

LOGAN, JOHN, was born at Fala, in the county of Edinburgh, in 1748. He was the son of a small farmer, and, being destined to the clerical profession, was educated in the University of Edinburgh; after which he became tutor to Sir John Sinclair. In 1773, almost immediately on being licensed as a preacher in the Established Church of Scotland, he was appointed to be one of the ministers of the town of Leith. In 1770 he had edited the posthumous poems of his friend Michael Bruce, incorporating with them some pieces which he claimed (and probably justly) as his own, and among which was the well-known 'Ode to the Cuckoo.' His poetical talents were further shown by several pieces of sacred poetry, some of which are inserted in the collection of hymns and paraphrases of Scripture annexed to the psalmody of the Scottish Church. In 1779, patronised by Blair, Robertson, and other literary men, he delivered in Edinburgh a course of lectures on the 'Philosophy of History;' the reputation of which justified him next year in aspiring, though unsuccessfully, to the professorship of Universal History in the university. Outlines of a part of his lectures were published under the title of 'Elements of the Philosophy of History, Part I,' 1781. In the same year appeared his 'Dissertation on the Government, Manners, and Spirit of Asia;' and a volume of poems, which reached a second edition before the year was closed.

Logan, if not a learned divine, or a very profound thinker, was a man of much eloquence, and a highly popular preacher. But his poetical endowments, strongly lyrical in their tendency, were the highest he possessed; and unfortunately he was tempted to apply these in a path where he was ill calculated to shine, and the adoption of which proved fatal not only to his professional usefulness, but to his happiness. In 1783 he printed and caused to be acted in Edinburgh a tragedy called 'Runnameda,' which had been rehearsed at Covent Garden, but refused a licence by the Lord Chamberlain. This publication brought on him the anger of his Presbyterian associates; and these and other annoyances, aggravated by an hereditary tendency to hypochondria, drove him to intoxication for relief. In 1785 he quitted his parochial charge, and repaired to London. There, retaining by agreement a part of his clerical income, he eked out his livelihood by literary labour, writing papers for the 'English Review,' and publishing in 1788 two works. The one was 'A Review of the principal Charges against Mr. Hastings,' which brought on Mr. Stockdale, the publisher, a prosecution for breach of privilege; the other was a useful summary entitled 'A View of Ancient History,' including 'The Progress of Literature and the Fine Arts, by William Rutherford, D.D., Master of the Academy at Uxbridge,' 2 vols. 8vo. He died in London on the 28th of December, 1788. His friends, Drs. Blair, Robertson, and Hardy, published a volume of his sermons in 1790, and a second in 1791. These sermons long enjoyed very great popularity, and have been several times reprinted. They are among the most eloquent that the Scottish Church has produced. A third edition of his poems, with an account of his life, appeared in 1805; and the poems are included in Dr. Anderson's collection.

LOGGAN, DAVID, a line-engraver and designer of considerable eminence, was born at Danzig in 1635. He appears to have first learnt his art from Simon de Pas in Denmark, and to have worked subsequently with Hondius in Holland. He came to England during the Commonwealth, and spent some time in engraving heads in London. But his first work of consequence in this country was a set of plates of the colleges of Oxford—'Oxoniam Illustrata,' for the sale of which he had fifteen years' privilege; he executed afterwards a

similar series of the colleges of Cambridge. He also engraved on eleven folio plates 'Habitus Academicorum Oxonia h Doctore ad Servientem.' Loggan is himself entered on the books of the University; in the matriculation registry there is the following entry—'David Loggan Gedanensis, Universitate Oxon. Chalographus, July 9, 1672.'

He married Mrs. Jordan, of a good family, near Witney, Oxfordshire, by whom he had a son, who became a fellow of Magdalen College, Oxford. He died at his house in Leicester-fields in 1693.

Loggan engraved many portraits of illustrious persons in the time of Charles II., many of the drawings of which were executed in lead by himself from the life—as George, Prince of Denmark; the Duke of Albemarle; the Earl of Clarendon; the Earl of Argyll; the Duke of Ormond; the Lord Keeper Guildford; Archbishop Sancroft; the Bishops Mew, Seth Ward, and Pearson; and many others. There are prints also by Loggan of Archbishops Usher and Boyle, and of Bishops Sprat of Rochester, Lake of Chichester, Crew of Durham, Compton of London, Gunning of Ely, Reynolds of Norwich, and Lloyd of St. Asaph. He engraved also three portraits of Charles II., in one of which the king is leaning his hand on Archbishop Sheldon; James, duke of York; the Duke of Monmouth; the Queen Catherine and Henrietta Maria; Pope Innocent XI.; the Earl of Derby, Sir Edward Coke, Sir John Chardin, Thomas Barlow, Titus Oates, and many others, which are enumerated by Vertue.

Loggan had the following assistants—A. Blooteling, G. Valck, Vanderbanck, and Peter Williamson; the first two came from Holland with Loggan.

LOIR, NICOLAS, a distinguished French painter and etcher, was born at Paris in 1624. His father was an eminent jeweller, and he placed Nicolas with Sebastian Bourdon, and sent him afterwards, in 1647, to complete his studies in Rome. Here Loir studied chiefly the works of N. Poussin, and so carefully, that in some instances it is said to be scarcely possible to distinguish Loir's copies from the originals. He had great facility of execution, and excelled in various styles, as history, landscape, and architecture. He also composed with elegance, and his colouring is agreeable; but his design is somewhat affected, and is not always vigorous or correct in its outline. He painted at Rome an excellent picture of 'Darius opening the Tomb of Semiramis,' which obtained him a great reputation. He returned to Paris in 1649, and was shortly afterwards employed by Louis XIV., at the Tuileries and at Versailles. He painted two apartments in the Tuileries—the Antichambre du Roy and the Salles des Gardes, where, by the mythical representation of the sun and other figures, he illustrated the distinctive character of the life and reign of Louis XIV.; and so far to the monarch's satisfaction, that he obtained by these works a life-pension of 4000 francs.

In 1663 he was elected a member of the French Academy of Painting, and he presented on the occasion, as his reception-piece, a picture representing the 'Progress of Painting and Sculpture during the reign of Louis XIV.:' but his masterpiece is considered to be 'Cleobis and Biton drawing their Mother in a chariot to the temple of Juno,' from the story of Herodotus (i. 81); Loir himself has made an etching of it. Another of his best works is 'Elymas the Sorcerer struck with Blindness,' in the cathedral of Notre Dame at Paris. He excelled in painting women and children, and particularly the Virgin Mary. He is said to have designed twelve Holy Families in a single day, which did not contain two figures alike. He died at Paris, rector of the Academy, in 1679. Loir's own etchings amount to 159 pieces, which, together with 80 engravings after his works by other artists, make a total of 239 prints. Several of the latter were engraved by his brother Alexis Loir.

Felibien describes several of the works of Loir at considerable length. Felibien and Loir were at Rome together, and Felibien's dates have been for this reason adopted in this article, where they differ from those of D'Argenville and Gault De Saint-Germain.

(Felibien, *Entretiens sur les Vies et sur les Ouvrages des Peintres, &c.*; D'Argenville, *Abrégé de la Vie des plus fameux Peintres, &c.*)

LOKMAN is represented in the Koran and by later Arabian tradition as a celebrated philosopher, contemporary with David and Solomon, with whom he is said to have frequently conversed. He was, we are told, an Arabian of the ancient tribe of Ad, or, according to another account, the king or chief of that tribe, and when his tribe perished by the Seal-ol-Arim he was preserved on account of his wisdom and piety. Other accounts, drawn mostly from Persian authorities, state that Lokman was an Abyssinian slave, and noted for his personal deformity and ugliness, as for his wit and a peculiar talent for composing moral fictions and short apologues. He was considered to be the author of the well-known collection of fables in Arabic, which still exist under his name. There is some reason to suppose that Lokman and Æsop were the same individual. This supposition is founded on the close correspondence of the traditional accounts of the person, character, and life of Lokman with those of Maximus Planudes respecting Æsop. [Æsopus, vol. i., p. 51.] Even the name of Lokman may, by a slight transposition, be derived from the Greek Alkman. If Lokman is not altogether a fictitious person, his history seems to have been mixed up with that of Æsop. The monk of Constantinople probably engrafted many incidents of his life on the few circumstances recorded by the classic writers respecting

that of the Greek fabulist. He may have been induced to do it by the apparently Asiatic origin of Æsop and the derivation of his name (from *αἶσος* and *ωπ*, which to a Greek would seem no forced derivation), and this assumed Asiatic origin might afterwards give rise to his dull buffooneries, his bodily defects, and Æthiopic extraction.

The fables of Æsop have by no means the character of ancient and original Greek compositions. Many of them are strongly marked with an Oriental character. They bear a very striking resemblance to the Indian fables in the 'Panchatantra'; they allude to Asiatic manners and customs; and animals are mentioned in them, which are only found in Upper Asia, as monkeys, peacocks, &c. In the fables of Lokmān the same peculiar features frequently occur. Hence we may safely infer that both collections were originally derived from one common source, the Indo-Persian entertainment of this description: from this source certainly came the fabulous work attributed to Syntipas (who was no other than the Sindbad of the 'Arabian Nights'), and other works of that kind, which during the middle ages so powerfully attracted the attention of Europe.

(See Boissonnade, 'Præf. ad Syntipam,' p. vi.; Grauert, 'De Æsopo et Fabulis Æsopicis,' Bonnæ, 1825.)

The fables of Lokmān show, in many instances, evident marks of a later and traditional origin; the moral or application is frequently misunderstood, or at least ill adapted to the apologue; a few ancient expressions had then become obsolete and are interpreted by words of more modern origin; and the language in general exhibits some slight deviations from grammatical accuracy, and approaches nearer to the modern Arabic idiom; as for instance, in the use of the oblique case instead of the first case. The style is easy and flowing. The fables have often been reprinted for the use of those who are beginning to study the language: after the first edition with a Latin interpretation, by Erpenius, Lugd. Batav., 1615; the best and latest editions are by Couain, Paris, 1818; Freytag, Bonnæ, 1823; Roediger, Halia, 1830, &c.

LOLLARD. The religious sect known as the Lollards, which had numerous adherents in this country towards the close of the 14th century, and differed in many points of doctrine from the Church of Rome, more especially as regarded the mass, extreme unction, and stonement for sin, is frequently said to have taken its name from a Walter Lollard or Lolhard, who was burnt alive for holding heretical doctrines at Cologne in 1322. But it would seem that Walter rather received his name from the sect, than gave a name to it: just as in the 'Prognosticatio' of Johannes Lychtenberger (a work very popular in Germany towards the close of the 15th century), great weight is attached to the predictions of one Reynard Lollard (Reynhardus Lolhardus), who was no doubt so called from the sect to which he belonged. The real origin of the term appears to be the German 'lullen,' 'lollen,' or 'lallen,' to sing, with the well-known termination of 'hard' which is subjoined to so many German words; and it implied a person who was continually praising God in sacred songs. Lollard subsequently became a term of reproach for all heretics, who were supposed to conceal erroneous doctrines under the appearance of piety; and, in England, at the close of the 14th century, it was given to the followers of Wycliffe. Knighton, noticing the success of that reformer's doctrines ('Twysd. Script.' x. col. 2664) says, "more than half of the people of England in a few years became Lollards." But the term was in use in England before Wycliffe began to preach; and though the name may have been derived from Germany, it is pretty certain that the opinions of the English Lollards were very different from those of the German sect. The German Lollards appear to have been pietists, such as have frequently sprung up in the Romish Church, who devoted themselves to a more than usually strict observance of devotional duties and works of charity, mingled with something both of asceticism and mysticism, but in no way presuming to impeach the doctrines or discipline of the church. The English Lollards on the contrary were filled with what might be properly called 'Protestant' opinions, and they appear to have circulated numerous predictions directed against the higher clergy and the priestly orders, and in process of time they seem to have ventured on political as well as theological prognostications; and hence numerous acts of parliament and orders in council were directly or indirectly promulgated against them. It seems indeed probable that the Lollard prophecies and traditions served to keep alive among the common people the old Wycliffite doctrines, and thus smoothed the way for the easy progress of the Reformation in England.

On the Continent the Lollards long remained as a permitted order in the Church. Mosheim, in his 'Ecclesiastical History' (b. iii., part ii., ch. 2), observes, "Charles, duke of Burgundy, obtained a decree from Sixtus IV., in the year 1472, by which the Cellites, or Lollhards, were admitted among the religious orders, and were withdrawn even from the jurisdiction of the bishops; and Julius II., in the year 1506, conferred on them still greater privileges. Many societies (he adds) of their kind still exist at Cologne and in the cities of the Netherlands, though they have essentially departed from their ancient manner of life." This of course was previous to the French revolution.

(Furetiere, *Dictionnaire Universel*; Mosheim, *Institutes of Ecclesiastical History*, by Murdock, 8vo, Lond., 1832, vol. ii., pp. 454-456.)

LOMBARDUS, LAMBERT, the designation of a painter whose

actual name is not known. He is sometimes called Lamprecht Susterman or Suterman, and, according to some, Lambert Suavius, and also Lamprecht Schwab. The place of his birth is equally unknown; it is said to be Liege or Amsterdam, more probably Liege, as he settled there after his return from Italy in 1538, and he died there in 1560, aged fifty-four. Vasari mentions Lamberto Lombardo as the most distinguished of all the Flemish painters, and styles him a great *letterato*, a judicious painter, and an excellent architect; but his account of him is contradictory: he had it from D. Lamponius, who wrote Lambert's life in Latin; it was published at Bruges in 1565, five years after his death. Lombardus studied under Jan de Mabuse before he visited Italy. Frans Floris, Hubert Golzius, and Willem Key were his scholars. His works consist chiefly of drawings with the pen in chiaroscuro. His coloured paintings are scarce; there are two of small dimensions in the Gallery of Berlin; there is a Pieta in the Pinacothek at Munich, which used to be attributed to Daniele da Volterra. Lambert's style is strictly Italian; he is said to have studied under Titian at Venice, and he lived some time in Rome. The surname of Lombardus was probably given to him by his Flemish countrymen on account of his style, which, different from their own, they distinguished as the Lombard style; Lombardy being formerly the general name for the northern part of Italy. (Vasari, *Vite de' Pittori*, &c.; Van Mander, *Het Leven der Schilders*, &c.; Sandrart, *Teutsche Academie*, &c.; Heineken, *Nachrichten von Künstlern*, &c.; Fiorillo, *Geschichte der Zeichnenden Künste*, &c.)

LOMONOSOV, MICHAEL VASILIEVICH, the father of modern Russian poetry and literature, was born in 1711, near Kholmogor, in the government of Archangel. His father, who was a serf of the crown, was by occupation a fisherman, and Michael more than once accompanied him in fishing excursions in the White and Northern seas. The long winters were devoted by him to study, in which he was assisted by the instruction he received from a priest; and although his stock of books was exceedingly limited, being nearly confined to a grammar, a treatise on arithmetic, and a psalter, he made such diligent use of them, that at last he had them all by heart. What he thus acquired served only to increase his desire for further information: he accordingly determined to make his way at once to Moscow, to which capital he journeyed in a cart that was conveying thither a load of frozen fish. Having greatly distinguished himself, first in the Zaikonopaski School there, and afterwards in the University of Kiev, he was sent to complete his education at the Academy of St. Petersburg in 1734, where he applied himself more particularly to mathematics, physics, chemistry, and mineralogy. After two years spent in those studies he was sent to Marburg, in order that he might perfect himself under the celebrated philosopher Christian Wolff, under whom he continued three years, and then proceeded to Freyburg, for the purpose of acquiring a practical knowledge of metallurgy and mining. Yet although chiefly occupied by such pursuits, he did not neglect literature, but diligently read all the best German poets of that period, and determined to rival them. One of his first literary efforts was an ode on the taking of Khoten, which he sent to the empress Anna, and which obtained for him general admiration. In the meanwhile he had married during his residence at Marburg, the consequence of which was that he so involved himself in pecuniary difficulties, that he was obliged to lose no time in returning to his own country. After his arrival at St. Petersburg he was made an associate of the Academy in 1741; and in 1746, professor of chemistry, besides which other appointments and honours were conferred upon him, and in 1760 he was made rector of the gymnasium and university. He died April 4 (16), 1765.

The complete collection of his works, published by the Academy, which has passed through several editions, extends to sixteen volumes; and the titles alone of his works would serve to show the great range and diversity of Lomonosov's studies. It would in fact be difficult to name any one who can be compared with him for the encyclopaedical multifariousness of his writings. Chronology, history, grammar, rhetoric, criticism, astronomy, physics, chemistry, meteorology, poetry—all engaged him by turns, and he showed himself competent for all. Later discoveries and improvements in science have of course dimmed the lustre which his writings of that class at first shed upon his name; but the service he rendered to the literature of his country, both by precept and example, no length of time can obscure. His grammar entitles him to be considered the legislator of the language, and as the first who gave regularity and stability to its elements: in poetry he has scarcely been surpassed among his countrymen in energy of style and sublimity of ideas. Polevoi's biographical novel, entitled 'M. V. Lomonosov,' 2 vols. 8vo, 1836, contains, with some admixture of fiction, almost all that can now be collected regarding the life of this remarkable man, together with notices of his chief literary contemporaries.

LONDONDERRY, ROBERT STEWART, MARQUIS OF, was born at the family seat of Mount Stewart, in the county of Down, Ireland, on the 18th of June 1769 (the same year which gave birth to the Duke of Wellington and to Napoleon Bonaparte). His father, of the same name, after representing the county of Down for many years in the Irish parliament, was made Baron Stewart of Londonderry in 1789, Viscount Castlereagh in 1795, Earl of Londonderry in 1796, and Marquis of Londonderry in 1816—all in the peerage of

Ireland. Robert was his only child that survived by his first wife, Sarah Frances, daughter of Francis Seymour, first marquis of Hertford, whom he married in 1766, and who died in 1770. He received the first part of his education at the grammar-school of Armagh, whence he was removed in 1788 to St. John's College, Cambridge. He was not yet of age when, on his father being raised to the peerage in 1789, he offered himself for the vacant seat in the representation of the county of Down, and was returned, though not without a severe contest, which lasted for three months, and is said to have cost the family 25,000*l.* or 30,000*l.* Nor did he come in without pledging himself, in contradiction to what had hitherto been the family politics, to the cause of parliamentary reform, which had for some time been a popular watchword in Ireland. For three or four years accordingly he was considered as belonging to the party of the opposition, though to the aristocratic and more moderate section of it. He very early began to take part in the debates. His conversion from liberalism seems to have taken place about 1793 or 1794; and it may be fairly considered to have been the natural result of his family position co-operating with the more alarming aspect which popular politics in Ireland were every day assuming; but he in consequence became excessively unpopular.

In the summer of 1794 he was returned to the British parliament for the borough of Tregony; and after remaining silent for a session he made his maiden speech in the House of Commons in seconding the address on the 29th of October 1795. It is said to have greatly disappointed the expectations excited by the reputation he had brought over with him. He was to the last a remarkably unequal speaker, at one time rising above, at another time—sometimes on the same night—falling below his ordinary or average style of execution in a degree scarcely credible, and the more wonderful in a person of so much nerve and self-possession.

He does not appear to have ever spoken again during this parliament, which was dissolved after the close of that its sixth session, in May 1796. That year he became Viscount Castlereagh; and he was again returned to the next British parliament, which met in September, for the borough of Orford. But he vacated his seat in July 1797; upon which he was re-elected to the Irish parliament for the county of Down, and was made Keeper of the Privy Seal for Ireland. In the beginning of 1798 he was appointed Secretary to the Lord Lieutenant and an Irish privy councillor; and from this date he may be regarded as having been distinctly the ministerial leader in the Commons. The credit or discredit of the measures adopted for the suppression of the rebellion, which broke out and was put down in this year, has also been commonly assigned to him, although it does not appear that he really did more than carry out the system which he found already in action when he came into office. He was no doubt one of the principal managers of the project of the Union, which followed two years after.

He was returned for the county of Down to the first Imperial Parliament, which met in February 1801; and also to the second, which met in November 1802; though, upon the latter occasion, not till after a severe struggle with the interest of the Downshire family, whose hostility had been provoked by the dismissal of the late marquis from the command of his militia regiment and the lord-lieutenancy of the county for his opposition to the Union.

In the beginning of 1802 he had been made a privy-councillor of Great Britain, and President of the Board of Control; and he retained that office after Mr. Pitt retired and throughout the Addington administration. After Mr. Pitt returned to power, Viscount Castlereagh was, in July 1805, promoted to be one of his majesty's principal secretaries of state (taking the department of War and the Colonies). He was now however thrown out of the representation of Down, but obtained a seat for the borough of Boroughbridge, for which he was returned in January 1806, on a vacancy made by the death of the Hon. John Scott, son of Lord Eldon. He resigned with the rest of the cabinet on the death of Mr. Pitt shortly after this; and to the next parliament, which met in December, with a new ministry, he was returned for the borough of Plympton Earle.

Upon the formation of the Portland administration, in April 1807, Lord Castlereagh was reappointed to his former office of secretary of state; and he was again returned for Plympton to the parliament which met in May of this year. He was now considered the individual principally answerable for the conduct of the war; and the failure of the disastrous expedition to Walcheren in the summer of 1809 not only drew upon him much general unpopularity, but involved him in a personal quarrel with his colleague Mr. Canning, the secretary for foreign affairs, which led first to the resignation of both, and then to a duel between them, in which Canning, on the second fire, was severely wounded. In the earlier part of this same year also, some sensation had been made by two reports of select committees of the Commons, which charged Lord Castlereagh, along with other persons, the one with corrupt practices in obtaining the returns of members for Irish boroughs, the other with irregularities in the disposal of Indian patronage.

Lord Castlereagh remained out of office till February 1812, when, on the resignation of the Marquis Wellesley, he was appointed secretary of state for the foreign department. After the death of Mr. Perceval, which followed in May, he was regarded as ministerial leader

in the Commons. To the new parliament which met in November 1812 he was once more returned as representative for the county of Down; and he also retained that seat in the next two parliaments, which met in August 1818 and in April 1820. The return to office of Mr. Canning however, in 1816, had relieved him from a considerable part of his labours in the conduct of public business in the House, till that gentleman again retired in 1820.

Meanwhile in the end of the year 1818 Lord Castlereagh had gone as British plenipotentiary to take part in the negotiations opened with the French government at Châtillon, which however broke off after a few weeks without any result; and he had also appeared as representative of the king of England at the Peace of Paris in May 1814; at the Congress of Vienna in October of the same year; at that of Paris after the battle of Waterloo in the following year; and at that of Aix-la-Chapelle in 1818. On such occasions as these his fine figure and grace of manner showed to great advantage. He likewise attended George IV. to Ireland in 1820, where he had for the moment the gratification of being extremely popular among his countrymen. He had been made a Knight of the Garter in 1818, and he became Marquis of Londonderry by the death of his father on the 8th of April 1821.

Lord Londonderry, who had for some time shown symptoms of mental disease, died by his own hand at his seat of North-Cray-Place, in the county of Kent, on the 12th of August 1822. The coroner's jury which sat upon the body brought in a verdict of lunacy. He had married in 1794 Lady Emily-Anne Hobart, youngest daughter of John, second Earl of Buckinghamshire, but he died without issue, and the title went to his half-brother, the subject of the following notice.

There was no brilliancy of intellect in Lord Londonderry, scarcely even the ordinary amount of literary cultivation and taste. His speaking, though fluent, and sometimes spirited, was always inelegant and slovenly, and occasionally so to a ludicrous degree. To any acquaintance with the philosophy of politics he made no pretension; nor did even his practical views commonly evince any superior sagacity. But he had great business talents; and that qualification, with his charm of manner, fitted him admirably for managing men, and was the main secret of his success in life. Something too however is to be attributed to certain moral qualities which he possessed. Whatever difference of opinion might be entertained about some of his political proceedings or acts done in his political capacity, his personal character was admitted by all who knew him to be that of an honourable and high-minded man, upon both whose firmness and fearlessness every reliance could in all circumstances be placed. His integrity in this sense had even something of a roughness or sternness that might almost be said to contrast with the amenity of his manner.

'The Correspondence of Robert, Second Marquis of Londonderry,' was edited by his brother, the third marquis, in 1850.

LONDONDERRY, CHARLES WILLIAM VANE, THIRD MARQUIS OF, K.G., G.C.B., only son of Robert, first Marquis, by his second wife, Frances, daughter of Lord Chancellor Camden, and half-brother of the second Marquis above noticed, was born in Dublin May 18, 1778. He was in his fifteenth year when he received his first commission as ensign in a foot regiment, and embarked under the Earl of Moira (afterwards Marquis of Hastings), to relieve H.R.H. the Duke of York from the perilous position in which he found himself after the reduction of Ypres and the capture of Charleroy. Having held for a few months the post of assistant quartermaster-general to a division of the forces under General Doyle, he was attached in the following year to Colonel Crawford's mission to the court of Vienna; and while thus occupied, he received a severe wound at the battle of Donauwerth. Returning home, he became aide-de-camp to his uncle, Earl Camden, during his Lord Lieutenancy in Ireland; having gained his majority in 1796, he was made in the following year lieutenant-colonel of the 5th Dragoon Guards, and while encamped on the Curragh of Kildare succeeded in bringing into partial discipline and order "the worst of bad regiments," which he commanded through the trying period of the Rebellion of 1798. The regiment having been subsequently disbanded for insubordination, Charles Stewart was appointed to the command of the 18th Light Dragoons, which he accompanied to Egypt under Sir Ralph Abercrombie; and in this expedition he was again severely wounded. In 1803 he became full colonel, and aide-de-camp to his Majesty, and for a short time occupied the post of under secretary of state for the war department. This post he quitted in order to accept the command of a hussar brigade under Sir John Moore in Portugal, as brigadier-general, and he did good service by covering the march of Sir John Hope's division into Spain, and the retreat of Sir John Moore, during which he successfully repulsed an attack of the French Imperial Guard. On reaching Corunna he was labouring under severe ophthalmia, and Sir John Moore, who had the highest opinion of his abilities, sent him home to report progress. In a few months however he returned to the seat of war as adjutant-general under Sir Arthur Wellesley, which post he held until May 1813. During the pursuit of Marshal Soult's army across the Douro, and again at Talavera, he rendered important services, for which he received the thanks of the House of Commons. During all this time, since the meeting of the first parliament of the United Kingdom in 1801, he had represented the county of Londonderry, and continued to do so until 1814, when he was raised to the Peerage as Lord Stewart, and sworn a member of the Privy Council. In the meantime he had risen

to the rank of lieutenant-general, and had received the order of the Bath, besides Portuguese, Russian, and Prussian honours, in recognition of his services not only in the field, but also in the capacity of envoy extraordinary and minister plenipotentiary at the court of Berlin, where he acted as commissioner to the allied sovereigns, and was specially charged with the supervision of Bernadotte, the Swedish king, who had armed his troops with English supplies, but was thought to be wavering in his allegiance.

The secret history of the time shows what kind of remonstrances the British envoy found it necessary to employ at so critical a moment as that which immediately preceded the battle of Leipzig. In 1814 he was appointed ambassador to Austria, and in the following year was one of the plenipotentiaries at the Congress of Vienna, together with his brother, Lord Castlereagh, the Duke of Wellington, and Lords Cathcart and Clancarty. Having been left some years a widower, in 1819 Lord Stewart married the only daughter of Sir Harry Vane Tempest, Bart., and assumed the name and arms of Vane; and having succeeded to the marquise on the death of his brother in 1822, was soon afterwards created Earl Vane, with remainder to his sons by his second marriage. In right of his wife he became possessed of large estates in the county of Durham, and applied himself actively to the development of their mineral and commercial resources. With this view he constructed the harbour of Seaham, a vast undertaking for private enterprise, and one which will long be regarded as a wondrous achievement of engineering science. After this time the marquis never accepted any public office or employment, with the exception of the embassy to Russia, which he undertook during Sir Robert Peel's brief tenure of office in 1834-35, but relinquished before proceeding to his destination. In 1837 he obtained the rank of general, and became colonel of the 2nd Life Guards in 1843. In 1852 the Earl of Derby bestowed on him the Garter vacated by the death of the Duke of Wellington. His lordship was the author of a 'History of the Peninsular War,' published in 4to, 1808-13, and he also edited the correspondence of his brother Robert, the second marquis, which he published in 1850. During upwards of half a century Lord Londonderry advocated in the Upper and Lower House the strongest Tory principles, and not always in the way best calculated to disarm opposition. He died at Holderness-house, London, March 1, 1854, from an attack of influenza, and was buried at Long Newton, near Wynyard Park, his princely seat in the county of Durham. He was succeeded in the marquise and Irish estates by his eldest son William Robert, who represented the County of Down for many years as Viscount Castlereagh; the earldom of Vane and his English property passed to the eldest son of his second marriage, George, viscount Seaham, M.P. for the Northern Division of the county of Durham.

* LONG, GEORGE, was born at Poulton in Lancashire in 1800. He received his early education at Macclesfield Grammar School under Dr. Davis, whence he removed to Trinity College, Cambridge, where he obtained a Craven scholarship in 1821, and the Chancellor's first medal in 1822. In the same year he was one of the Wranglers; in 1823 one of the Middle Bachelors' prizemen; and he subsequently obtained a fellowship at Trinity. In 1824 the University of Virginia had been established chiefly through the exertions of Mr. Jefferson, and as the best scholars were to be obtained from England as professors, Mr. Long was strongly recommended, and was induced to accept the office of Professor of Ancient Languages in the University of Virginia. The University of Virginia was well endowed by the State. At the special invitation of some eminent persons in London, he returned to England, and became professor of the Greek language, literature, and antiquities in the London University (now University College), founded in 1826. This office he held till 1831, when he resigned.

The Society for the Diffusion of Useful Knowledge having been instituted in 1826, Mr. Long, on his return from America, joined it, and was an earnest and active member. He edited for the Society the 'Journal of Education,' which was published at the cost of Mr. C. Knight from 1831 to 1835. In 1832 the 'Penny Cyclopædia' was commenced; it was completed in 29 volumes, including two volumes of Supplement, in 1846. As the editor of this work, which was wholly original, and was produced under the superintendence of the Society, but at the sole charge of the publishers, Messrs. C. Knight and Co., the exertions of Mr. Long were unremitting. In the address at the conclusion of the 27th volume, the committee of the Society and the publishers offered their thanks "to the editor, by whose learning, unwearied diligence, and watchfulness, unity of plan has been maintained during eleven years, error as far as possible has been avoided, and regular monthly publication, without a single omission, has been accomplished." In 1844 Mr. Long began a translation from Plutarch of 'Select Lives,' forming a history of the 'Civil Wars of Rome,' which was issued in 'Knight's Weekly Volume,' and was completed in five volumes in 1848. In 1850 he wrote 'France and its Revolutions: a Pictorial History,' also published by Mr. C. Knight. From 1842 to 1844 he had likewise been engaged in editing for the Society for the Diffusion of Useful Knowledge 'The Biographical Dictionary,' published by Messrs. Longman, which however was only carried on to the end of letter A, forming seven half-volumes. During the progress of these various labours Mr. Long had entered himself as a student of the Inner Temple, and was called to the bar in 1837. On the appointment of lecturers by the inns of court, he was the first

appointed in 1846 by the Society of the Middle Temple to deliver a course on Jurisprudence and the Civil Law. No choice could have been more judicious. It presented to Mr. Long the prospect of an employment for which he was eminently fitted; and he, not without reluctance, resigned the Latin professorship at University College, upon which he had entered in 1842. But the attendance of students at the law lectures was not then compulsory, and the system received so little encouragement that Mr. Long relinquished an appointment which the indifference of the authorities of the Inn rendered inefficient. 'Two Discourses delivered in the Middle Temple Hall, with an Outline of the Course, by G. Long,' a valuable exposition of the Roman law to an English student, was published early in 1847. In 1849 he was appointed Classical Lecturer at Brighton College, where he has since resided. While here he has been engaged in editing several classical works, particularly 'Caesar's Gallic War' and Cicero's 'Orations,' enriched with many valuable notes, for which his knowledge of the Roman law rendered him peculiarly qualified. He has also edited a 'Classical Atlas,' and has been a large contributor to Dr. W. Smith's 'Classical Dictionaries.' Mr. Long's reputation as a distinguished scholar is not confined to this country.

LONG, ROGER, was born in the county of Norfolk about the year 1680. At the age of seventeen he entered Pembroke Hall, Cambridge, took the degree of Master of Arts in 1704, and that of Doctor of Divinity in 1728. The following year he was elected a Fellow of the Royal Society and Vice-Chancellor of the University; in 1749 he was appointed Lowndes's Professor of Astronomy, and in 1751 he was presented to the rectory of Bradwell in Essex, which he held until his death, December 16, 1770. His principal work is a treatise on astronomy, in two large quarto volumes, the first of which was published in 1742, the other in 1764: a second edition appeared in 1784. This work contains very good descriptions of the apparent motions of the heavens. Besides his astronomy he wrote, under the signature of 'Dicaiphilus Cantabrigiensis,' a pamphlet entitled 'The Rights of Churches and Colleges defended,' 1731; 'Reply to Dr. Gally's Pamphlet on Greek Accent,' 1755; 'Life of Mahomet,' prefixed to Oakley's 'History of the Saracens,' 1757; 'Music Speech spoken at the Public Commencement, July 6, 1714,' and other poems, London, 1719, to which is prefixed a short notice of the author's life. With a view to popularise the science of astronomy, he caused to be constructed a hollow sphere, wherein thirty persons could sit conveniently, and on the inner surface of which was a representation of the heavens as they would appear to an observer in north latitude. The keeper of this sphere, who is generally an undergraduate, receives 6*l.* per annum. The habits of Dr. Long were peculiarly moderate, his ordinary drink being water; and for some years previous to his death he abstained altogether from eating animal food. By his will he bequeathed 600*l.* for the benefit of his college. (*Biog. Brit.; Memoir of Dr. Wood mentioned above.*)

* LONGFELLOW, HENRY WADSWORTH, was born at Portland, Maine, United States of North America, on the 27th of February 1807, the son of the Hon. Stephen Longfellow of that place. In his fifteenth year he entered Bowdoin College, Brunswick, at which college he graduated with high honours in 1825. While at college he contributed various pieces of verse to the 'United States Literary Gazette.' He was intended for the study of the law, and spent some time in his father's office for that purpose; but a professorship of modern languages having been founded in Bowdoin College and offered to him, he accepted the office as more congenial to his tastes. In order to qualify himself for the office, being then quite a youth, he came over to Europe, where he spent three years and a half in travelling through France, Italy, Spain, Germany, Holland, and England, and in acquiring a knowledge of the languages and literature of those countries. His residence in Germany, in particular, had a powerful influence upon him—an influence visible throughout his subsequent writings. It begot in him a kind of eclectic theory of literature, and a love for European and especially mediæval and German themes and sentiments, as distinct from that intense American nationalism which some of his countrymen advocated. "All that is best," he has said, "in the great poets of all countries is not what is national in them, but what is universal. Their roots are in their native soil, but their branches wave in the unpatriotic air." This was a state of feeling very proper in one who was to fill the office of Professor of Modern Languages in an American College; which office he returned to occupy in the year 1829, while yet only in his twenty-third year. While discharging the duties of the post, he wrote various articles of literary biography and criticism for the 'North American Review;' in 1833 he published a translation of a Spanish poem, with an Essay on Spanish Poetry; and in 1835 appeared the first of his regular prose-works—'Outra-Mer, or a Pilgrimage beyond the Sea,' containing sketches of his travels in France, Spain, and Italy. In this same year, Mr. George Ticknor having resigned the Professorship of Modern Languages and Literature at Harvard University, Mr. Longfellow, then twenty-eight years of age, was called upon to succeed him. Before entering on the office he spent another year in European travel, visiting Germany again, and also Switzerland, Denmark, and Sweden, and thus adding a knowledge of the Scandinavian tongues and literature to his previous acquirements. From the year 1836 to the present time Mr. Longfellow has held, with high distinction, the chair in

Harvard University; and it is during this period that he has published the series of works by which he is best known. In 1839 he published his prose-romance of 'Hyperion'; in 1840 his 'Voices of the Night,' a collection of poems; in 1841 his 'Ballads and other Poems,' including translations from the German and Swedish; in 1842 (in which year he again visited Europe) a drama called 'The Spanish Student'; in 1843 his 'Poems on Slavery'; in 1845 his 'Belfry of Bruges,' and also an extensive work entitled 'The Poets and Poetry of Europe,' consisting of translations from various languages, with introductions and biographical notices; in 1847 his poem of 'Evangeline,' a story of early American colonial life, written in English Hexameters; in 1848 his 'Kavanagh,' a kind of poetico-philosophical tale; in 1849 a political series entitled 'The Sea-Side and the Fireside'; in 1851 the 'Golden Legend,' a mystical and dramatic version of a mediæval German story; and lastly, in 1855, his 'Song of Hiawatha,' a kind of American Indian mythical epic, written in a very peculiar metre.

From the nature of some of the subjects in this long series, it will be seen that Mr. Longfellow, while true in the main to the cosmopolitan theory of poetry and literature with which he set out in his career, has yet exhibited his genius again and again in national American topics. No poem indeed is so thoroughly American in its scope and associations as the 'Song of Hiawatha.' Of all American poets Mr. Longfellow is the most popular on this side of the Atlantic. Almost all his works have been reprinted separately, some of them in various forms by various publishers; and there are at present (1856) several editions of his collective works in the market, one or two of which are illustrated. Though the influence of Goethe, Jean Paul, and other Germans is to be traced both in the matter and in the method of some of his writings, there can be no doubt that he is a man of fine original faculty, a highly-cultivated scholar, and a genuine literary artist.

LONGHI, GIUSEPPE, an Italian painter, and one of the most distinguished engravers of the 19th century, was born at Monza in 1766. His father was a silk-merchant, and intended his son for the Church; but, through his own determination, Giuseppe was finally placed with the Florentine Vincenzo Vangelisti, professor in the Brera at Milan, under whom he learnt engraving. He studied afterwards some time in Rome, where he became acquainted with Raphael Morghen, a very celebrated engraver; and Longhi soon obtained a reputation himself by his print from the 'Genius of Music,' a picture by Guido in the Chigi Palace.

After his return to Milan he was chiefly employed in miniature painting, until he was ordered by Napoleon I. to make an engraving of Gros's portrait of him; and he was appointed about the same time (1798) to succeed Vangelisti, deceased, as professor of engraving in the Academy of the Brera, to which, during Longhi's professorship, many distinguished engravers of the present time in Italy owe their education. It was one of Longhi's first principles to make the means subservient to the end, and not the end to the means; he always deprecated cleverness of line as a principal object, and in his own works manual dexterity is invariably subordinate to conformity of style. His first object was to give, as nearly as possible, the general character, colour, and texture of the original, and the etching-needle was accordingly his chief instrument. He excelled in light and shade. Among his principal works are—the 'Vision of Ezekiel,' after Raffæle; the 'Sposalizio, or the Marriage of the Virgin,' and a 'Holy Family,' after the same; the 'Entombment,' after D. Crespi; the 'Magdalen,' after Correggio; the 'Madonna del Lago,' after Da Vinci; 'Galatea,' after Albani; and many heads, after Rembrandt. The 'Sposalizio' was engraved as a companion-piece, or *pendant*, to Morghen's large print of the 'Transfiguration,' by Raffæle. He commenced in 1827 to engrave the 'Last Judgment,' by Michel Angelo, from a drawing by the Roman painter Minardi, but he died before it was quite finished. Longhi died of apoplexy in 1831. He was a Knight of the Iron Crown, and member of many academies.

Besides a few poems and other essays, there is a treatise on engraving by Longhi ('La Calcographia'), which has been translated into German by C. Barth, and contains a life of the author by F. Longhena. A life of him also, with a list of his works, was published at Milan in 1831; and there are notices of him in the 'Kunstblatt,' and in Nagler's 'Neues Allgemeines Künstler-Lexicon.'

LONGMONTANUS, the author of a treatise in Greek 'On the Sublime,' is said to have been born either in Syria or at Athens, but at what time is uncertain. His education was carefully superintended by his uncle Fronto, a celebrated teacher of rhetoric; and he also received instruction from the most eminent teachers of philosophy and rhetoric of his age, especially from Ammonius and Origen. He afterwards settled at Athens, where he taught philosophy, rhetoric, and criticism to a numerous school, and numbered among his disciples the celebrated Porphyry. His school soon became the most distinguished in the Roman empire. After remaining at Athens for a considerable time, he removed to Palmyra at the invitation of Zenobia, in order to superintend the education of her sons. He did not however confine his attention to this duty, but also took an active part in public affairs, and is said to have been one of Zenobia's principal advisers in the war against Aurelian, which proved so unfortunate to himself and his royal mistress. After the capture of Palmyra by Aurelian A.D. 273, Longinus was put to death by order of the emperor.

Longinus wrote many works on philosophical and critical subjects, now known only by their titles, none of which have come down to us, with the exception of his treatise 'On the Sublime,' and a few fragments preserved by other writers. There is however some doubt whether the treatise 'On the Sublime' (*περὶ ὑψους*) was in reality written by this Longinus. Modern editors have given the name of the author of this treatise as 'Dionysius Longinus;' but in the best manuscripts it is said to be written by Dionysius, or Longinus, and in the Florence manuscript by an anonymous author. Suidas says that the name of the counsellor of Zenobia was Longinus Cassius. Some critics have conjectured that this treatise was written by Dionysius of Halicarnassus, or by Dionysius of Pergamum, who is mentioned by Strabo (625, Casaub.) as a distinguished teacher of rhetoric; but the difference of style between this work and the acknowledged works of Dionysius of Halicarnassus renders this conjecture very improbable, and as to the other Dionysius, the conjecture has no foundation. The treatise 'On the Sublime' has for its object the exposition of the nature of the sublime, both as to the expression and the thought, which the author illustrates by examples. As a specimen of critical judgment the work has always maintained a high rank, and in point of style is perspicuous and precise.

The best editions of Longinus are by Pearce (1724), Morus (1769), Toup (1778), with improvements by Ruhken (Oxford, 1806), Weiske (1809), and Eggerix (1837); the best translations are the German by Schlosser, the French by Boileau, and the English by W. Smith.

LONGLAND, or LANGELANDE, ROBERT, the reputed author of the 'Visions of Piers Plowman.' He was a secular priest, born at Mortimer's Cleobury in Shropshire, and afterwards Fellow of Oriel College in Oxford. He lived in the reigns of Edward III. and Richard II.; and, as Bale assures us, was one of the earliest disciples of Wycliffe. Longland, according to the same author, completed the 'Visions' in 1369, when John Chichester was mayor of London. The poem here named consists of 'XX. Passus' (pauses or breaks), exhibiting a series of dreams supposed to have happened to the author on the Malvern Hills in Worcestershire. It abounds in strong allegorical painting, and censures with great humour and fancy most of the vices incident to the several professions of life, and particularly inveighs against the corruptions of the clergy and the absurdities of superstition; the whole written, not in rhyme, but in an uncouth alliterative versification. Of the 'Visions of Piers Plowman' there are two distinct versions, or rather two sets of manuscripts, each distinguished from the other by peculiar readings. Of one, no fewer than three editions were printed in 1550, by Robert Crowley; and one in 1561, by Owen Rogers, to which is sometimes subjoined a separate poem, entitled 'Pierce the Plowman's Crede,' a production of a later date than the 'Visions,' inasmuch as Wycliffe, who died in 1384, is mentioned (with honour) in it as no longer living. Of the other version of the 'Visions,' the first edition was that published by Dr. Thomas Dunham, Whitaker, 4to, London, 1813, who, in the following year, republished the 'Crede,' from the first edition of that poem printed by Reynold Wolfe, in 1553. The best edition of the 'Visions of Piers Plowman' is one admirably edited by Mr. T. Wright, and published in a very convenient form, and at a remarkably moderate price, by Mr. Russell Smith.

(Bale, *Script. Illustr.*, 4to, Bas., 1559, cent. vi. p. 474; Percy, *Reliques*, edit. 1794, ii. 272; Ellis, *Specim. of Engl. Poet.*, i. 147; Whitaker and Wright's editions of *P. Ploughman*, *Introd.*)

LONGMONTANUS, CHRISTIAN SEVERIN, better known as Christian Longomontanus, from the latinised form of his native village, Langberg, in Denmark, was born in 1562. His early education was probably wholly due to his own exertions, as the circumstances of his father, who was a poor ploughman, would scarcely have enabled him to incur much expense on that account; but upon the death of this parent, which took place when he was only eight years old, he was sent for a short time to a good school by his maternal uncle. This improvement in young Severin's condition excited so much jealousy among his brethren, who thought themselves unfairly dealt with, that he determined, in 1577, upon removing to Wyborg, where he lived eleven years, "working by night to earn a subsistence, and attending the lectures of the professors during the day." After this he went to Copenhagen and there became known to Tycho Brahe, who employed him in reducing his observations and making other astronomical calculations up to the time of his quitting the island of Høe in 1597, when he sent him to Wandenburg, and thence to his residence at Benach, near Prague. His stay here was not of long duration, in consequence, it is said, of his attachment to his native country, though it is perhaps attributable to the death of his patron, which happened in 1601. [BRAHE, TYCHO.] He returned by a circuitous route, in order to visit the place which had been honoured by the presence of Copernicus, and reached Wyborg about the year 1603, where he was appointed superintendent (*recteur*) of the gymnasium, and two years after was promoted to the professorship of mathematics in the university of Copenhagen, the duties of which he continued to discharge till within two years of his death. He died at Copenhagen, 8th October 1647.

The following list of his published works is taken from the 18th volume of the 'Mémoires des Hommes Illustres,' Paris, 1732; 'Theses summan doctrinæ Ethicæ completentes,' 1610; 'Disputatio Ethicæ

de Animæ Humanæ Morbis,' 1610; 'Disputationes duæ de Philosophiæ origine, utilitate, definitione, divisione, et addiscendi ratione,' 1611-18; 'Systematis Mathematici,' part 1; 'Arithmetican Solutam duobus libris methodice comprehensam,' 1611; 'Cyclometria à Lunulis reciproce demonstrata, unde tam areæ, quam perimetri Circuli exacta dimensio et in numeros diductio secuta est, hactenus ab omnibus Mathematicis unice desiderata,' 1612, 1627, and 1664; 'Disputatio de Eclipsibus,' 1616; 'Astronomia Danica in duas partes tributa, quarum prima doctrinam de diuturna apparente Siderum Revolutione super Sphæra armillari veterum instaurata duobus libris explicat; secunda Theorias de Motibus Planetarum ad Observationes Tychonis de Brahé, &c. itidem duobus libris complectitur,' 1622, 1640, and 1663 (Gassendi, in his 'Life of Tycho Brahé,' says that this work belongs rather to that astronomer than to Longomontanus, since the tables of the planetary motions were either calculated by Longomontanus under the immediate superintendence of Tycho, or copied by him from those which Tycho had previously caused to be computed); 'Disputationes quatuor Astrologiæ,' 1622; 'Pentast Problematum Philosophiæ,' 1623; 'De Chronolabio Historico,' 1627; 'Disputatio de Tempore trium Epocharum, Mundi Conditi, Christi Nati, et Olympiadis primæ,' 1629; 'Zetemata septem de summo hominis bono,' 1630; 'Disputatio de summo hominis malo,' 1630; 'Geometria quæsitæ xlii. de Cyclometria rationali et vera,' 1631; 'Inventio Quadraturæ Circuli,' 1634 (this work gave rise to a very animated dispute between the author and Dr. John Pell, an English mathematician, who proved that the demonstration there given of the quadrature of the circle was fallacious, but notwithstanding Longomontanus died in the conviction that he had effected that which has since been shown to be impracticable); 'Disputatio de Matheseos Indole,' 1636; 'Coronis Problematica ex Mysteriis Trium Numerorum,' 1637; 'Problemata duo Geometrica,' 1638; 'Problema contra Paulum Guldinum de Circuli Mensura,' 1638; 'Introductio in Theatrum Astronomicum,' 1639; 'Rotundi in Plano, seu Circuli absoluta Mensura,' 1644; 'Energeia Proportionis sesquialtertiæ,' 1644; 'Controversia cum Pello de vera Circuli Mensura,' 1645.

LONGUS is the name of the author, or supposed author, of a Greek pastoral romance, 'The Loves of Daphnis and Chloë,' or, according to the literal version of the Greek title (Ποιμενικά τὰ κατὰ Δάφνον καὶ Χλόην), 'Pastoral Matters concerning Daphnis and Chloë,' which has been generally admired for its elegance and simplicity, and is one of the earliest specimens of that kind of composition. We know nothing of the author, who is supposed to have lived in the fourth or fifth century of our era. The 'Daphnis' of Gesner approaches the nearest of any modern composition to an imitation of the work of Longus. This pastoral has gone through numerous editions, the best of which are—that of Leipzig, 1777, called 'Variorum,' because it contains the notes of former editors; Villoison's, with numerous notes by the editor, Paris, 1778; Schäfer's, Leipzig, 1803; that of Courier, Rome, 1810; that of Passow, Leipzig, 1811, Greek and German; and by Sinner, Paris, 1829, and Seiler, Leipzig, 1853. Courier discovered in the manuscript of Longus, in the Laurentian library at Florence, a passage of some length, belonging to the first book, which is wanting in all the other manuscripts. He first published the fragment separately at his own expense and distributed the copies gratis. He afterwards embodied it in his edition of the whole pastoral, of which he published only 52 copies, most of which he sent to distinguished scholars of various countries. He also republished Amyot's French translation of Longus, adding to it the translation of the discovered passage. [COURIER, PAUL LOUIS.]

LOPE DE VEGA. [VEGA.]

LORENZO, or LORENZETTO, AMBROGIO AND PIETRO DI, two celebrated Italian painters of the 14th century, were born at Siena about 1300. They were brothers, as we learn from the following inscription, formerly in the Hospital of Siena:—"Hoc opus fecit Petrus Laurentii et Ambrosius ejus frater, 1330." It was attached to pictures of the 'Presentation' and of the 'Marriage of the Virgin,' which were destroyed in 1720, and was preserved by the Cav. Pecci. This inscription explains the name given by Vasari to Pietro, whom he calls Petrus Laurati or Laurenti, which is evidently an erroneous reading of Petrus Laurentii—Pietro di Lorenzo.

Some of the works of these painters still remain, though the principal of their works, by Ambrogio, which is described by Ghiberti (in 'Cod. Magliabecchiana,' f. 8 & 9), is destroyed. It was painted in the Minorite convent at Siena, and represented the fatal adventures of some missionary monks. In the first compartment a youth was represented putting on the monastic costume; in another, the same youth was represented with several of his brother monks about to set out for Asia, to convert the Mohammedans; in a third, these missionaries are already at their place of destination, and are being chastised in the sultan's presence, and are surrounded and mocked by a crowd of scoffing infidels; the sultan judges them to be hanged; in a fourth the young monk is already hanged to a tree, yet notwithstanding he continues to preach the gospel to the astonished multitude, upon which the sultan orders their heads to be cut off; the next compartment is their ceremonious execution by the sword, and the scaffold is surrounded by a great crowd on foot and on horseback; after the execution follows a great storm, which is represented in all the detail of wind, hail, lightning, and earthquake, from all of which the crowd are protecting themselves as they best can, and this miracle,

as it was considered, is the cause of many conversions to Christianity. Such is the description of this picture by Lorenzo Ghiberti, the first sculptor of his time, and he finishes by declaring it to be, as a painted story, a wonderful thing—"per una storia picta mi pare una maravigliosa cosa;" many of the actors, he says also, appeared to be living beings. There is still in the Sala delle Balestre, in the public palace of Siena, a *tempera* painting of 'Peace,' represented by a view within and without the city of Siena, with numerous inhabitants variously occupied in business and in pleasure. War was likewise represented in this hall, but is now defaced; there are however other allegorical works still remaining, and Rumohr observes that what remain justify Ghiberti's praises of what have disappeared, speaking with relation to the time of their production—1337, 1338.

Of the several pictures by Ambrogio Lorenzetti mentioned by Ghiberti, only one remains—the 'Presentation of the Virgin in the Temple,' in the Scuole Regie, and in this some of the women are excellent.

Ghiberti does not mention any works by Pietro Lorenzetti, and there is only one authenticated work by him; it is in the Stanza del Pilone, a room against the sacristy of the cathedral of Siena, and is marked "Petrus Laurentii de Senis me pinxit, a. M.CCC.XLII." It represents, according to Rumohr, some passages from the life of John the Baptist, his birth, &c.

Vasari mentions many works by Pietro in various cities of Tuscany, where he says his reputation was greater than either Cimabue's or Giotto's. He attributes to him a picture of the early fathers and hermits in the Campo Santo at Pisa; it is engraved in Lasinio's 'Pitture del Campo Santo di Pisa.'

In 1355 Pietro was invited to Arezzo to paint the cathedral, in which he painted in fresco twelve stories from the life of the Virgin, with figures as large as life and larger, but they have long since perished; they were however in good preservation in the time of Vasari, who completely restored them. He speaks of parts of them as superior in style and vigour to anything that had been done up to that time.

The works of these painters, though relatively good, are not exempt from any of the errors or defects of the prevailing style in Italy previous to Donatello, Masaccio, and Ghiberti; and they display even some of the barbarities of the Byzantine school. Several pictures are attributed to them in various collections, but wholly without evidence as to their authorship.

(Vasari, *Vite de' Pittori*, &c.; Della Valle, *Lettere Sanesi*; Lanzi, *Storia Pittorica*, &c.; and especially Rumohr, *Italienische Forschungen*, in which the two Lorenzetti are treated of at considerable length.)

LORENZO DE' MEDICI. [MEDICI.]

LORRAINE, CARDINAL DE. [GUISE.]

LORRAINE, CLAUDE. [CLAUDE.]

LOTTO, LORENZO, a celebrated Venetian painter of the 16th century. He is supposed to have been one of the scholars of the Bellini, and also an imitator of Lionardo da Vinci. He lived long at Bergamo, and was generally considered a native of that place; "but," says Lanzi, "we are indebted to Sig. G. Beltramelli for showing, in a work published in 1800, that Lotto was a native of Venice." He found him thus noticed in a public contract, "M. Laurentius Lottus de Venetiis nunc habitator Bergomi" (Master Lorenzo Lotto, of Venice, now a resident of Bergamo). Lotto lived also some time at Treviso, at Recanati, and at Loreto, where he died. His works range from 1513 to 1554. Lanzi ventures an opinion that Lotto's best works could scarcely be surpassed by Raffaële or by Correggio, if treating the same subject. His masterpieces are the Madonnas of S. Bartolomeo and Santo Spirito, at Bergamo. (Vasari, *Vite de' Pittori*, &c.; Tassi, *Vite de' Pittori*, &c.; *Bergamaschi*; Lanzi, *Storia Pittorica*, &c.)

LOUDON, JOHN CLAUDIUS, was born at Cambuslang in Lanarkshire, on the 8th of April 1783, where his mother's only sister, who was the mother of Dr. Claudius Buchanan, author of 'Christian Researches in Asia,' then resided. His father was a farmer, and lived at Kerse Hall, near Gogar, about five miles from Edinburgh. As a child, Loudon exhibited a taste for gardening. He was early sent to reside with an uncle at Edinburgh in order that he might be educated, and here he attended a public school, and also the classes on botany and chemistry. In addition to the Latin he learned at school, he obtained a knowledge of French and Italian, and paid his masters himself out of the proceeds of translations from these languages, which he sold. At the age of fourteen he was placed with a nurseryman and landscape gardener, and continued his attendance on the classes of botany and chemistry, and to these he added agriculture, in the University of Edinburgh. During this period he acquired the habit of sitting up two nights every week for the purpose of study, a habit which he continued for many years.

In 1803 Loudon first came to London, and, as he brought good recommendations from Edinburgh, he found no difficulty in getting employment in his profession of a landscape gardener. One of his earliest literary efforts was made this year in the form of a paper contributed to the 'Literary Journal,' entitled 'Observations on Laying Out the Public Squares of London.' It was the practice when this article was published to adorn the squares of London with a very sombre vegetation, consisting of yews, pines, and other heavy plants.

This practice the author strongly condemned, and recommended the lighter trees, as the oriental plane, the sycamore, the almond, and others, which are now generally cultivated, and add greatly to the beauty of London squares. In 1804 he returned to Scotland, and in the same year he published his first work, entitled 'Observations on the Formation and Management of Useful and Ornamental Plantations,' 8vo, London. He returned to England in 1805, and published a small work, entitled 'A Short Treatise on some Improvements lately made in Hothouses,' 8vo, Edinburgh. In 1806 he published a 'Treatise on Forming, Improving, and Managing Country Residences, and on the Choice of Situations appropriate to every Class of Purchasers,' 8vo, London. This work was illustrated with thirty-two copper-plate engravings of landscape scenery drawn by the author.

In 1806 an accident turned his attention to farming. Travelling one night on the outside of a coach, exposed to the rain, and neglecting to change his clothes, he became attacked with rheumatic fever, which left him so debilitated that for the sake of his health he took lodgings at Pinner, near Harrow. Here he had an opportunity of observing the inferior farming then practised in England, and persuaded his father to take a farm near London. The result was that, conjointly with his father, he rented Wood Hall; and such was their success that the following year Loudon wrote a pamphlet entitled 'An Immediate and Effectual Mode of Raising the Rental of the Landed Property of England, &c., by a Scotch Farmer, now Farming in Middlesex.' This led to his introduction to General Stratton, the owner of Tew Park in Oxfordshire, and his undertaking the management of this estate as a tenant. Here he established a kind of agricultural college, in which he engaged to teach young men the principles of farming; and in 1809 he wrote a pamphlet on the subject entitled 'The Utility of Agricultural Knowledge to the Sons of the Landed Proprietors of Great Britain, &c., by a Scotch Farmer and Land-Agent.' He carried on his farming so successfully that in 1812 he found himself worth 15,000*l.*, and being more anxious for the cultivation of his mind than the improvement of his circumstances, he determined to give up his farm and travel on the Continent. He left England in March 1813, and after visiting the principal cities of Germany and Russia, experiencing a variety of adventures, and recording with his pen and pencil all that he found worthy of notice in his own profession, he returned to his own country in 1814. On his return to London, finding that the chief part of his property was lost through unfortunate investments, he devoted himself with renewed energy to his old profession of landscape-gardening. He now determined to publish a large work on the subject of gardening; and in order to complete his knowledge of continental gardens, for the purpose of rendering his work more valuable, he visited France and Italy in 1819. In 1822 appeared his great work, 'The Encyclopædia of Gardening,' which contained not only a vast amount of original and valuable matter on every department of horticulture, but was copiously illustrated with woodcuts in the text. This work had a very extraordinary sale, and fully established the reputation of the author as one of the most learned and able horticulturists of his day. A second edition was published in 1824. The success of this work led him to engage in another equally laborious and extensive, and on the same plan, devoted to farming. This was published in 1825, with the title 'Encyclopædia of Agriculture.' Another work, though not exactly on the same plan, but similar in design and comprehensiveness, was edited by him, and published in 1829, with the title 'Encyclopædia of Plants.' This however contained less of the author's own work than the preceding, the plan and general design being all that he claimed as his own. This was followed by another, the 'Encyclopædia of Cottage, Farm, and Villa Architecture,' which was all his own labour. "The labour," says Mrs. Loudon, "that attended this work was immense; and for several months he and I used to sit up the greater part of every night, never having more than four hours' sleep, and drinking strong coffee to keep ourselves awake." This book was published in 1832, and was very successful. He then planned a work of still greater extent, which demanded more time than any of the preceding: this was his 'Arboretum et Fruticetum Britannicum,' comprehending an account, with engravings, of all the trees and shrubs growing wild or cultivated in Great Britain. This work was brought out in 1838, and, with the preceding, was published at his own expense. After paying artists and other persons engaged in the work, "he found at its conclusion that he owed ten thousand pounds to the printer, the stationer, and the wood-engraver who had been employed." The sale of this work was slow, and seemed to have involved him in pecuniary difficulties, which, although they did not abate his energy, still preyed upon his mind, and hastened his death.

During the time that these works were going on he edited several periodicals. In 1826 he established the 'Gardener's Magazine,' which he carried on till his death. In 1828 he commenced the 'Magazine of Natural History,' which he edited till 1836, when it passed into other hands. In 1834 he started the 'Architectural Magazine,' which he gave up in 1838. In 1836 he commenced the 'Suburban Gardener,' a monthly publication; so that he had four monthly works, in addition to the 'Arboretum,' going on at the same time.

These labours would appear very extraordinary for a man in perfect health and with the use of his limbs, but they become more extraordinary when the circumstances are known under which he

wrote them. His first attack of rheumatic fever, in 1806, was so severe as to produce permanent anchylosis of his left knee. Subsequently his right arm became affected, and this was so severe that after trying the usual remedies he was induced to submit to sham-pooling, during which process his arm was broken so close to the shoulder as to render it impossible to have it set in the usual manner; and on a subsequent occasion it was again broken, when it was found necessary, in 1826, to have recourse to amputation. In the meantime his left hand became so affected that he could only use the third and little finger. After this period he was obliged to employ for all his works both an amanuensis and a draftsman. With this infirm and maimed body, his mind retained its vigour to the last. Early in 1843 he was attacked with chronic inflammation in his lungs, which terminated his existence on the 14th of December of that year. He continued working till the day of his death, and "died standing on his feet."

Few literary men have attempted or executed so much as Loudon, and that under circumstances of the most depressing and afflictive nature. The tendency of his mind was essentially practical, and in this will be found the cause of the success and the influence of his writings. In his works on gardening he displays great anxiety for the mental improvement and welfare of the class of men who make this their occupation; and the book on which he was employed at the time of his death is devoted to them, and is entitled 'Self-Instruction for Young Gardeners.' In all his works he never lost the opportunity of pointing out the bearing of his subject on the moral and social improvement of his fellow-creatures.

He married in 1831 Jane, daughter of Mr. Thomas Webbs, of Ritwell House, near Birmingham. Mrs. Loudon had already (in 1827) published 'The Mummy,' a novel, which attracted much notice, and led Mr. Loudon to seek an introduction to the authoress. To her husband, as already intimated, she was an invaluable assistant in his literary labours, all his subsequent and more important works owing much to her taste and industry. After his death Mrs. Loudon edited more than one reprint of his more popular works, and some of his more elaborate and costly ones. In her own name Mrs. Loudon has published 'The Ladies' Flower Garden,' 'Botany for Ladies,' 'Gardening for Ladies,' 'The Lady's Companion to the Flower Garden,' 'The Lady's Country Companion,' 'The Isle of Wight,' &c.; all of which are written in a remarkably pleasing and perspicuous style. In consideration of her own and her husband's literary services a pension of 100*l.* a year has been awarded to her out of the Civil List. The materials for the above notice of Mr. Loudon have been chiefly collected from a Memoir by Mrs. Loudon in 'Self-Instruction for Young Gardeners.' We may add that their only daughter Agnes Loudon is the authoress of several brief tales and children's books.

*LOUGH, JOHN GRAHAM, sculptor, was born early in the present century at Greenhead, in Northumberland, where his father was a small farmer. Employed from his earliest days in the fields he received but little school education, yet he became very fond of books, taught himself to draw, and eventually to mould figures in clay. Some of his models accidentally caught the eye of a gentleman in the neighbourhood, who, becoming interested in the youth, invited him to his house, showed him casts and engravings from the great sculptors of ancient and modern times, and thoroughly aroused his opening ambition. Young Lough laboured hard in his spare hours till he felt himself strong enough to venture on the hazardous step of proceeding to London and there maintaining himself while he mastered the sculptor's art. Under many privations he toiled on, until success began to reward his labour. In London he found friends and advisers, among the most ardent of whom was Haydon the painter, who from the first prognosticated his future eminence. As a matter of course Haydon urged the earnest study of the Elgin marbles, and to these Lough devoted himself for some time with great advantage. After one or two more modest ventures, Mr. Lough in 1827 sent to the Royal Academy exhibition a colossal statue of 'Milo,' which excited a very vivid impression, and brought the sculptor patrons and commissions. The 'Milo' he executed in marble for the Duke of Wellington, and the cast of it in the Crystal Palace at Sydenham will suffice to show that the self-taught sculptor had caught the old Greek spirit, though not perhaps the manner, better than many a carefully-trained academician.

In 1834 Mr. Lough visited Italy, where he remained four years diligently occupied in studying the great works there, but, as in England, without placing himself under the direction of any master. During these four years he executed several commissions for the dukes of Northumberland and Sutherland, Lord Egremont, and other English noblemen and wealthy commoners. On his return he exhibited (1838) a marble group of 'A Boy giving Water to a Dolphin,' in which the influence of his Italian studies was plainly visible. In 1840 he exhibited 'A Roman Fruit Girl;' in 1843 a marble statue of 'Ophelia,' a group, also in marble, of 'A Bacchanalian Revel,' and a 'Bas-Relief from Homer;' in 1844, a marble group, 'Hebe Banished,' a statue of 'Iago,' and a 'Design for the Nelson Monument.' He also in this year sent to the Westminster Hall Exhibition his now well-known poetic group entitled 'The Mourners;' but for some reason he was not one of the sculptors employed in the decoration of the New Houses of Parliament. From this time monumental statues

and portrait-busts came more and more to employ his chisel, though not to the exclusion of the ideal. The first to be mentioned of this order is the statue of 'Her Majesty' (1845), which stands in the centre of the Royal Exchange area. The companion statue of Prince Albert which Mr. Lough was commissioned to execute, was placed in 1847 in the great room at 'Lloyds': both are works of much merit. In 1848 he executed a colossal marble statue of the 'Marquis of Hastings' for Malta, and a recumbent statue of 'Southey' for Keswick church. From 1845 to 1856 Mr. Lough contributed nothing to the exhibitions of the Royal Academy, though fully occupied during that period. But to the Great Exhibition of 1851 he sent his vigorous group of 'Fighting Horses,' and from his Shaksperian series (executed for Sir Matthew White Ridley), 'The Jealousy of Oberon,' 'Ariel,' 'Puck,' and 'Titania,' works of much quaint and original fancy; and a colossal marble group, 'Satan subdued by the Archangel Michael,' in many respects the grandest of his works—scarcely suffering even by comparison with Flaxman's famous group of a similar subject. Mr. Lough's chief contribution to the Academy exhibition of 1856 was a very admirable posthumous bust of 'Edward Forbes,' one of two executed for the Museum of Practical Geology, and King's College. In the Crystal Palace at Sydenham may be seen casts from his statues of 'Milo,' 'David,' 'Satan,' 'Ariel,' 'Titania,' and 'Puck'; his fine group of 'The Mourners'—a dead warrior by whom a female is kneeling in an agony of grief, while his charger stands beside him with drooping head; and a bas-relief entitled 'The Apotheosis of Shakspeare,' a cast from the original executed in marble for his munificent patron Sir M. W. Ridley, as a frieze for the room in which his series of Shaksperian statues is placed.

LOUIS (LUDWIG in German, LUDOVICUS in Latin) is the name of many kings of France. Louis I., called 'le Débonnaire,' and also 'the Pious,' son of Charlemagne, was made his father's colleague in the empire, A.D. 813, and after the death of Charlemagne, in the following year, he succeeded him as king of France and emperor of the West. Bernard, son of Pepin, elder brother of Louis, had been made by his grandfather king of Italy, or rather Lombardy ("quæ et Longobardia dicitur" are the expressions of the chroniclers), which kingdom was defined in Charlemagne's will as being bounded by the Ticino and the Po as far as the territories of Reggio and Bologna. All to the west of the Ticino and south of the Po was then annexed to the French crown. Bernard, having conspired to supplant his uncle in the empire, was seized by order of Louis, and his eyes were put out, in consequence of which he died in a few days. Louis showed great sorrow for this act of cruelty, to which he had been advised by his courtiers, and he did public penance for it before an assembly of bishops. In the year 820 Louis appointed his son Lotharius king of Italy and his colleague in the empire. To his son Louis he gave Bavaria, Bohemia, and Carinthia, and to his other son, Pepin, he gave Aquitania. In 830 Lotharius and Pepin revolted against their father, on the plea of the bad conduct of their step-mother Judith of Bavaria, a licentious and ambitious woman. At a diet however which was held at Aix-la-Chapelle, the father and sons were reconciled. The sons revolted again in 833, and their father, being forsaken by his followers, was obliged to give himself up to his son Lotharius, who took him as prisoner to Soissons, sent the empress Judith to Tortona, and confined her infant son Charles, afterwards Charles the Bald, the object of the jealousy of his half-brothers, in a monastery. A meeting of bishops was held at Compiègne, at which the archbishop of Rheims presided, and the unfortunate Louis, being arraigned before it, was found guilty of the murder of his nephew Bernard, and of sundry other offences. Being deposed, he was compelled to do public penance in sackcloth, and was kept in confinement. In the following year however Louis, king of Bavaria, took his father's part, his brother Pepin of Aquitania joined him, and they obliged Lotharius to deliver up their father, who was reinstated on the imperial throne. Lotharius, after some further resistance, made his submission and returned to Italy. The emperor Louis now assigned to Charles, son of Judith, the kingdom of Neustria, or Eastern France, including Paris, and Pepin having died soon after, Aquitania was added to Charles's portion. Lotharius had all Italy, with Provence, Lyon, Suabia, Austrasia, and Saxony. But Louis of Bavaria claimed all Germany as far as the Rhine, for himself, and invaded Suabia. The emperor Louis marched against him, and a diet was assembled at Worms to judge his rebellious son, but meantime the emperor fell ill, and died in an island of the Rhine near Mainz, in June 840, after sending to his son Lotharius the imperial crown, his sword, and his sceptre. Lotharius was acknowledged as emperor, and after a war against his brothers, he retained Italy, Provence, Burgundy, and Lorraine. Charles the Bald succeeded his father as king of France, and Louis of Bavaria had all Germany. Thus was the imperial crown separated from that of France. The emperor Louis was a weak prince. It was under his reign that the fiefs were first made transmissible by descent, which hitherto had been held for life only. Louis also allowed the popes elect to take possession of their charge without waiting for his confirmation.

LOUIS II., called 'Le Bègue,' or 'The Stammerer,' son of Charles the Bald, succeeded his father on the throne of France in 877. He claimed also the imperial crown against his cousin Carloman, son of Louis the German, but with no success. In France also he was opposed

by several great lords, among others by Boson, the brother of his step-mother, Richilda. In order to conciliate them, he followed the example of his father, by parceling out the domain of the crown into fiefs in favour of his vassals. He died at Compiègne in 879, at the age of thirty-five, leaving three sons, Louis, Carloman, and Charles, called 'The Simple.'

LOUIS III. succeeded his father Louis II., together with his brother Carloman. Louis had Neustria, and Carloman Aquitania. Boson founded the kingdom of Arles, which included Provence, Dauphiny, Lyon, Savoy, and Franche Comté. The Normans ravaged the northern coasts of France, where at last they settled. Louis died in 882, and his brother Carloman remained sole king of France.

LOUIS IV., son of Charles the Simple, ascended the throne of France in 936. He sustained several wars against the emperor Otho I. on the subject of Lotharingia or Lorraine, and also against the Normans, whose duke William, son of Rollo, died, leaving an infant son, Richard. Louis's reign was also disturbed by revolts of the great vassals, especially of Hugo, count of Laon, the father of Hugo Capet. Louis died in 954, and was succeeded by his son Lotharius.

LOUIS V., styled 'The Fainéant,' or 'Do Nothing,' son of Lotharius, succeeded him in 986. He reigned only one year, and died of poison, administered, as it was said, by his wife, the daughter of an Aquitanian lord. With him ended the Carolingian dynasty, and Hugo Capet took possession of the throne.

LOUIS VI., called 'Le Gros,' son of Philip I., succeeded his father on the throne of France in 1108. The larger part of the kingdom was then in the hands of the great vassals of the crown, over whom the king's supremacy was but nominal. The king's direct authority extended only over Paris, Orleans, Etampes, Compiègne, Melun, Bourges, and a few more towns, with their respective territories. The duchy of Normandy was in the possession of Henry I. of England, who had taken it from his brother Robert during the preceding reign of Philip I. Henry and Louis quarrelled about the limits of their respective states, and thus began the wars between the English and the French in France, which lasted for more than three centuries. Louis had the worst in several encounters. In 1120 he made peace, but war broke out again, when Henry of England was joined by his son-in-law the emperor Henry V., who entered Champagne, where he was met by Louis at the head of all his vassals, lay and ecclesiastical; even Suger, abbot of St. Denis, was there with the subjects of the abbey. These united forces are said to have amounted to 200,000 men, and the emperor thought it prudent to retire. Louis however could not depend on the same zealous assistance from his vassals in his quarrel with Henry of England as duke of Normandy, because the vassals considered it as their interest not to increase the power of their king. Meantime Henry of England having given one of his daughters in marriage to Conan, son of the Duke of Brittany, the latter did homage to Henry for Brittany as a fief of Normandy. Louis le Gros, assisted by his able minister l'Abbé Suger, succeeded in recovering for the crown some of the power which the great vassals had usurped: he revived the practice of Charlemagne of sending into the provinces commissioners called 'missi dominici,' who watched the judicial proceedings of the great lords in their respective domains, and received appeals and complaints, which they referred to the king for judgment at the great assizes. In most cases however the king had not the power of enforcing his own judgments. But another and a more effective measure of Louis le Gros was the establishment of the communes, for which he deserves to be remembered among the earliest benefactors of the French people. He granted charters to many towns, the inhabitants of which were thereby empowered to choose their local magistrates, and administer the affairs of the community, subject however to the sanction of the king. By this means he began the creation of the third estate, or commons, as a check on the overgrown power of the feudal nobles. Louis le Gros died at Paris in 1137, at the age of sixty, and was buried at St. Denis. He was succeeded by his son Louis VII.

LOUIS VII., called 'Le Jeune,' son of Louis le Gros, succeeded his father in 1137. He married Eleanor, daughter and heiress of William, duke of Aquitania, a lady who was handsome and inclined to gallantry. Thibaut, count of Champagne, having revolted against the king, Louis took and burnt his town of Vitry. St. Bernard, abbot of Clairvaux, advised Louis, in order to atone for this cruelty, to go on a crusade; but the Abbé Suger, who was minister of Louis, and had also served the king's father, opposed this project. The zeal of St. Bernard however prevailed, and the king set off with his wife and a large army in 1147. Suger and Raoul, count of Vermandois, Louis's brother-in-law, were left regents of the kingdom. The crusade proved unsuccessful: the Christians were defeated near Damascus, and Louis, after several narrow escapes, returned to France in 1149. His first act after his arrival was to repudiate Eleanor, whose conduct during her residence in the East had been improper; but the bishops, to avoid scandal, dissolved the marriage on the plea that it was not valid because the king and queen were cousins. Suger, who was now dead, had strongly opposed on political grounds the dissolution of the marriage, and the event proved the justness of his foresight, for Eleanor married Henry of England and Normandy, afterwards Henry II., who by this marriage became possessed of Aquitania, Poitou, Maine, and in fact of one-third of France, comprising the whole maritime

territory from Dieppe to Bayonne. Louis married Constance of Castile for his second wife. A war now broke out between him and Henry II. of England, which lasted several years, and ended by a peace in 1176, after which Henry as duke of Normandy and peer of France attended the coronation of Louis's son, Philip II., called 'Auguste,' in 1179. Louis died in September, 1180, at Paris, being sixty years of age.

LOUIS VIII., styled 'Cœur de Lion,' succeeded his father Philippe Auguste in 1223. Like his father, he was engaged in wars with the English, from whom he took the Limousin, Perigord, Aunis, and all the rest of the country north of the Garonne. At the request of the pope, he made war against the Albigenes, and laid siege to Avignon, where he died in 1226.

LOUIS IX., called St. Louis, succeeded his father, Louis VIII., when he was twelve years of age, under the regency of his mother, Blanche of Castile. During the minority of the king there was a constant struggle between the crown and the great feudatories, at the head of whom were Thibaut, count of Champagne, and the Count of Brittany. During this troubled period, Queen Blanche displayed much character and considerable abilities. Her son, as soon as he was old enough, putting himself at the head of his faithful vassals, reduced the most refractory lords, and among others the Count of Brittany, who came with a rope round his neck to ask pardon of the king, which was granted. Henry III. of England, who supported the rebels, was defeated by Louis near Saintes, upon which a truce of five years was signed between the two kings. During an illness Louis made a vow to visit the Holy Land, and in June 1248 he set out for the East. He landed in Egypt, and took Damiat, but being defeated at the battle of Mansoura, he was taken prisoner, compelled to pay a heavy ransom, and to restore Damiat to the Mussulmans. From Egypt he sailed to Acre, and carried on the war in Palestine, but with no success, till the year 1254, when he returned to France. The best account of this expedition is by Joinville, who was present, 'Histoire de St. Louis,' edited by Ducange, with notes, folio, 1668. Louis on his return found ample occupation in checking the violence and oppressions of the nobles, whom he treated with wholesome rigour. He published several useful statutes, known by the title of 'Etablissements de St. Louis;' he established a police at Paris, at the head of which he put a magistrate called 'prévôt;' he classed the various trades into companies called confrairies; he established the college of theology, called La Sorbonne from the name of his confessor; he created a French navy, and made an advantageous treaty with the king of Aragon, by which the respective limits and jurisdictions of the two states were defined. The chief and almost the only fault of Louis, which was that of his age, was his religious intolerance; he issued oppressive ordonnances against the Jews, had a horror of heretics, and used to tell his friend Joinville "that a layman ought not to dispute with the unbelievers, but strike them with a good sword across the body." By an ordonnance he remitted to his Christian subjects the third of the debts which they owed to Jews, and this "for the good of his soul." (Martennes, 'Thesaurus Anecdotorum,' vol. I., p. 980.) This same feeling of fanaticism led him to another crusade, against the advice of his best friends, in which he met his death. He sailed for Africa, laid siege to Tunis, and died in his camp of the plague in August 1270. Pope Boniface VIII. canonised him as a saint in 1297. Louis's brother Charles, count of Anjou and Provence, took the kingdom of Naples from Manfred of Suabia, and established there the dynasty of Anjou.

LOUIS X., called 'Hutin,' an old French word meaning 'quarrelsome,' son of Philippe le Bel, succeeded his father in 1314. His uncle Charles de Valois had the principal share of the government during his reign, although the king was of age. Louis imprisoned and put to death his wife Margaret in 1315, on the ground of adultery, and then married Clemence of Hungary. He carried on an unsuccessful war against the Count of Flanders, to maintain which he increased the taxes, sold the judicial offices, and obliged the crown serfs to purchase their freedom. Louis died after a short reign in 1316, not without suspicions of poison. He was succeeded by his brother, Philip V.

LOUIS XI., son of Charles VII., succeeded his father in 1461, being then thirty-nine years of age. He had early exhibited a duplicity of disposition, for which his father mistrusted him. He had revolted against his father in 1456, and being defeated, had taken refuge at the court of Philip, duke of Burgundy, who protected him and maintained him for six years, until his father's death. Louis, when king, became the bitterest enemy of Charles, the son of Philip. The cautious cunning and consummate hypocrisy of Louis gave him the advantage over the rash courage and headlong passion of Charles, which at last caused his ruin and death at the siege of Nanci, in January 1477. Louis was successful in depressing the power of the feudal nobles, several of whom he put to death, and in rendering the authority of the crown independent of them. He took into his service a body of Swiss, and kept also 10,000 French infantry, whom he paid out of his own treasury. He carried on a war against Maximilian of Austria, who had married Mary of Burgundy, daughter and heiress of Duke Charles, and took from him Artois and Franche-Comté; but at last peace was made between them by the treaty of Arras, in 1482. Louis also made peace with Edward IV. of England. Charles of Anjou, count of Provence, bequeathed that province to Louis XI., as well as

his claims to the thrones of Naples and Sicily—a bequest which led to the subsequent attempts of the French to conquer Naples. Louis XI. died in 1483, being sixty years of age. He was a strange compound of daring and superstition, of abilities and weakness, of firmness and perseverance in his political views, joined to an abject meanness of sentiment and habit. The taille, or direct taxation, was tripled under his reign. He was the first who assumed the title of 'Most Christian King,' which was given to him by the pope in 1469. The best account of Louis XI. is given by his contemporary and confidant Comines, in his 'Mémoires.'

LOUIS XII., son of Charles, duke of Orleans, descended from a younger son of Charles V., succeeded in 1498 Charles VIII., who had left no children. He had been obliged by Louis XI. to marry his daughter Joan in 1476, but after his accession to the throne he dissolved the marriage, and married Anne of Brittany, the widow of Charles VIII. Louis asserted his claims to the duchy of Milan, which were derived from his grandmother, Valentina Visconti, daughter of John Galeazzo, duke of Milan, and sister of the last duke, Filippo Maria, who had died without leaving legitimate children. But Filippo Maria left a natural daughter Bianca, who had married the famous condottiere Francesco Sforza, who succeeded his father-in-law as duke of Milan, and the Sforza family had been confirmed in the possession of the duchy by the emperor, Milan being considered as a fief of the empire. Francesco was succeeded by his son Galeazzo, who, being murdered in 1475, left an infant son Gian Galeazzo, whose uncle Ludovico assumed the government during his minority. After the death of Gian Galeazzo in 1494, Ludovico, who was suspected of having poisoned his nephew, was proclaimed duke, and confirmed by a diploma of the Emperor Maximilian I. Louis however marched with an army into Italy, and took possession of the duchy of Milan in 1499. In the following year he made Ludovico Sforza prisoner, and carried him to France, where he died in confinement. Emboldened by this success, Louis now put forward the claims of the crown of France to the possession of Naples derived from the Anjou. [LOUIS XI.] These claims had been already asserted by his predecessor Charles VIII., who however, after invading Naples, was obliged to give up his conquest. The Aragonese dynasty had resumed possession of that kingdom; and Frederic of Aragon, who was king of Naples, feeling that he was too weak to resist Louis XII., applied for assistance to his relative Ferdinand the Catholic, king of Spain, who sent him an army under the celebrated commander Gonzalo of Cordova. Louis had recourse to secret negotiations; he proposed to Ferdinand of Spain to dethrone his relative and protégé, and to divide the kingdom of Naples between them. Such a proposal was exactly suited to the character of Ferdinand, and he assented to it. Whilst Louis marched against Naples, Gonzalo, in consequence of secret orders from his master, was occupying in his name the towns of Calabria and Puglia; and a third worthy partner in such a transaction, Pope Alexander VI., gave to Louis the solemn investiture of the crown of Naples, which he had a few years before bestowed upon the unfortunate Frederic. The latter, perceiving the perfidiousness of his Spanish relative, surrendered himself to Louis, who gave him the duchy of Anjou and a pension for life. Louis and Ferdinand soon quarrelled about their respective shares of the spoil, and Ferdinand gave orders to Gonzalo to drive away the French from Naples. The two battles of Seminara and Cerignola, both fought in April 1503, in which the French were defeated by the Spaniards, decided the fate of the kingdom of Naples, which became entirely subject to Spain. A few years after, Pope Julius II. formed a league with Ferdinand and the Swiss to drive the French out of Italy altogether; and after three campaigns, Gaston de Foix, duke of Nemours, being killed at the battle of Ravenna, the French abandoned Lombardy; and Maximilian Sforza, son of Ludovico, supported by the Swiss, assumed the ducal crown of Milan in 1512. Louis sent a fresh army into Italy under La Trimouille, who was beaten at Novara by the Swiss in June 1513; and thus, after fifteen years of fighting, intrigues, and negotiations, the French lost all their conquests in Italy. Louis XII. has been styled by courtly historians "the father of his people;" he was in fact kind-hearted towards his subjects, and he reduced the taxes by one-half; but his foreign policy was unjust and imprudent. In order to forward his ambitious purposes he allied himself to the atrocious Borgias and the unprincipled Ferdinand; and the calamities which his troops inflicted upon Italy, the horrors of the storming of Brescia, the cruel execution of Count Avogadro and his two sons because they resisted the invaders, and other atrocities committed by the French commanders, are great stains on the memory of this 'paternal' monarch. Having lost his best troops, he reluctantly gave up his Italian schemes, made peace with Ferdinand and the pope, and, at the age of fifty-three, married Mary, sister of Henry VIII. of England. His young wife made him forget his years and the weakness of his constitution: "On her account," says the biographer of Bayard, "he changed all his mode of life; instead of dining at eight o'clock in the morning, or before, he fixed his dinner-hour at noon; and instead of going to bed at six in the evening, as heretofore, he often sat up till midnight." He did not live quite three months after his marriage, and died at Paris in January 1515, leaving no male issue. He was succeeded by Francis I.

LOUIS XIII., son of Henri IV. and of Mary de' Medici, succeeded

his father in 1610, being only nine years of age, under the regency of his mother. In October 1614, he was declared to be of age, and in the following year he married Anne, daughter of Philip III. of Spain. Concino Concini, *maréchal d'Ancre*, a Florentine, the favourite minister of the queen-dowager, had, by his insolence and his intrigues, excited the jealousy of many of the high nobility, with the prince of Condé at their head, who left the court and began a civil war. Louis XIII., who was impatient of the rule of his mother, and of the favourite, but had not spirit enough to shake it off, consulted with a young courtier called Luines, and by his advice ordered Vitri, an officer of his body-guard, to arrest the marshal. Vitri stopped him on the drawbridge of the Louvre; the marshal attempted to defend himself, upon which Vitri killed him. The people of Paris made great rejoicings at his death, dragged his body through the streets, cut it to pieces, and threw into the river. The parliament of Paris declared him to have been guilty of treason and sorcery, and on the same grounds sentenced his wife, who was also a Florentine, named Galigai, to be beheaded, and her body burned, a sentence which was executed on the 8th July 1617. This trial and sentence are amongst the most disgraceful of the old French judicature. The queen-dowager was sent to Blois under arrest. Luines now became the ruling favourite; for Louis was totally incapable of governing himself during the whole of his life. Some years after the queen-dowager escaped from Blois, and being supported by several nobles, the civil war broke out again; but Armand du Plessis, bishop of Luçon, known afterwards as Cardinal de Richelieu, acted as mediator between the king and his mother, in consequence of which he obtained a cardinal's hat, and in 1624 became minister, and lastly prime minister, which he continued to be till his death in 1642. Richelieu was certainly one of the greatest ministers of France under the old monarchy; fertile in resources, firm, sagacious, and unscrupulous, he succeeded in humbling and weakening the feudal nobility, and thus paved the way for the absolute government of Louis XIV. He checked the ambition of the house of Austria by assisting, first secretly and afterwards openly, the German Protestant states and the Swedes, by which means France acquired a considerable influence in the affairs of the Empire. In 1628 Richelieu took La Rochelle, the great stronghold of the Protestants of France, which had often withstood the kingly forces under the former reigns. The French armies took an important part in the Thirty Years' War; they acted on the Rhine in concert with the Swedes, whilst another French army carried on the war in Italy against the Spaniards, a third army was fighting in Flanders, and a fourth on the frontiers of Catalonia. The French were generally successful: they took Roussillon, Alsace, the duchy of Bar, and other provinces. In December 1642, Richelieu died at Paris, being fifty-eight years of age. His great object had been, during all his ministry, to render the government of the king absolute, and he succeeded. Richelieu at the same time patronised learning and the fine arts; he established the royal press; he embellished Paris; he was magnificent and high-minded: his ambition was not a selfish or a vulgar one. Among his agents and confidants there was a Capuchin, called Father Joseph, whom he employed in the most secret and important affairs, and who seems to have equalled his master in abilities.

Louis survived his minister only a few months; he died in May 1643, leaving his son Louis XIV. a minor, under the regency of the queen-mother.

LOUIS XIV. succeeded his father in 1643, being then hardly five years old. His reign, including his minority, lasted seventy-two years, a long and important period, marked by many events and vicissitudes all over Europe, in most of which Louis took an active part. The history of such a reign requires volumes, and has been written or adverted to and commented upon by numerous historians who have treated of the age. But the best works for making us acquainted with the character of Louis and of his government, and the condition of France under his reign, are the contemporary memoirs of St. Bimon, Dangeau, Louville, Noailles, Cardinal de Retz, Madame de Motteville, and others, and above all the writings of Louis XIV. himself, especially his 'Instructions pour le Dauphin,' which reveal his most secret thoughts. Cardinal Mazarin, an Italian by birth and a pupil of Richelieu, but inferior to his master, was the minister of the regency during the minority of Louis. He continued the war against Spain and the emperor of Germany in conjunction with the Swedes. Turenne, the marshal of Grammont, and the Duke of Enghien, afterwards the great Condé, distinguished themselves in those wars. The treaties of Münster and Osnabruck (1648) put an end to the Thirty Years' War, and Mazarin had the satisfaction of concluding this peace, called that of Westphalia, by which France acquired Alsace, the Suintgau, and the seignory of the bishoprics of Metz, Toul, and Verdun. The same year however that the war in Germany was terminated the civil war of La Fronde broke out in France. The parliament of Paris and several of the high nobility revolted against the authority of the cardinal. Louis, then ten years of age, the queen-regent, and Mazarin, were obliged to leave the capital in January 1649, and this humiliation seems to have made a deep impression on the mind of Louis, and to have contributed to render him mistrustful, arbitrary, and stern. After some fighting, peace was made, and the court re-entered Paris in the month of August. This was the same year in which Charles I. was beheaded in England and

the monarchy abolished. The prince of Condé, who had been the means of appeasing the civil war, having given offence to the queen and the cardinal, was arrested, and Turenne and other Frondeurs began again the civil war in the following year (1650). [CONDÉ, LOUIS DE.] In 1651 the queen ordered the release of Condé; Turenne made his peace with the court, and Mazarin was exiled by a sentence of the parliament of Paris. Condé however continued the war, and being joined by the Duke of Orleans, took possession of Paris, which the court had left again. In October, 1652, an arrangement took place, the king re-entered Paris, Condé emigrated to join the Spaniards, the Cardinal de Retz, one of the chief actors in the disturbances, was put in prison at Vincennes, and Mazarin himself returned to Paris in February 1653, and resumed the ministry. In 1654 Louis XIV. made his first campaign in Flanders against the Spaniards. In the following year he concluded a treaty of alliance with Cromwell against Spain. The war continued during that and the next year with various success; Turenne commanded the French troops, and the prince of Condé fought on the side of the Spaniards against his own country.

In 1657 the Emperor Ferdinand III. died, and Mazarin intrigued to prevent the election of his son Leopold, and to obtain the imperial dignity for Louis XIV. He began by supporting, through his agents at the Diet, the pretensions of the elector of Bavaria, and representing and exaggerating the danger to the liberties of Germany which would attend another election of an Austrian prince to the imperial throne. It was soon found however that the elector of Bavaria was not likely to be nominated, and Mazarin then intrigued separately with the electors in favour of Louis. He bribed, by actual disbursements of money and ample promises of territorial aggrandisement, the arch-bishops electors of Treves and Cologne, as well as the elector-palatine, and even the elector of Brandenburg. Had he succeeded in gaining over the elector of Mayence, John Philip de Schonborn, chancellor of the empire, Louis XIV. would have succeeded. Louis himself repaired to Metz, his army being cantoned in that neighbourhood, as if to support his pretensions. The cardinal sent to the Diet at Frankfurt the marshal of Grammont and M. de Lyonne to further his object. In his instructions he empowered them to offer to the elector of Mayence 300,000 livres, besides a revenue of 90,000 more for his relations, and, if necessary, to send at once to Frankfurt the value of 1,200,000 livres in plate and other valuable objects as a security. ('Instructions adressées de Stenay, le 29 Juillet, 1657, par Mazarin, à Messrs. de Grammont et de Lyonne,' quoted by Lemontey among the 'Pièces Justificatives' of his 'Essai sur l'Etablissement Monarchique de Louis XIV.')

The elector of Mayence however adjourned the election to the following year, and wrote to Leopold of Austria, king of Hungary and Bohemia, son of Ferdinand, promising him his vote. The other electors kept the money they had received from Mazarin, and turned also in favour of Leopold, who was unanimously elected in 1658. From that time began the bitter animosity of Louis against Leopold, which lasted half a century, and was the cause of three long and bloody wars.

Meantime the war with Spain was brought to a close in November 1659, by cardinal Mazarin, by the treaty of the Bidasoa, in which the marriage between the Infanta Maria Theresa, daughter of Philip IV. of Spain, and Louis XIV., was concluded. Spain gave up the Artois and Roussillon, and stipulated for a free pardon to the Prince of Condé. The new queen was married and made her entrance into Paris the following year (1660). She brought with her half a million of crowns as a dowry. She was extremely weak in her intellect and childish in her habits, but harmless and good-natured. Louis XIV. always behaved to her with considerate regard, but never felt any affection towards her, and he resorted to the society of a succession of mistresses, of whom Mademoiselle de la Vallière, Madame de Montespan, and Madame de Maintenon are the most known.

In February 1661 Mazarin concluded at Vincennes a third and last treaty with Charles, duke of Lorraine, by which Strasburg, Phalsburg, Stenay, and other places were given up to France. Nine days after this treaty Mazarin expired, at fifty-nine years of age, leaving a large fortune to his nieces Mancini, and to his nephew, whom he made duke of Nevers.

With the death of Cardinal Mazarin began the real emancipation of Louis XIV., who from that moment took the reins of the government entirely into his hands. He dismissed and imprisoned Fouquet, the superintendent or minister of finance, and had him tried on the charges of peculation and treason by an extraordinary commission, which condemned him to banishment; but Louis aggravated the sentence by shutting him up in the castle of Pignerol, in the Alps, where he died in 1680. In appointing Colbert in the room of Fouquet, Louis made a good choice, and much of the splendour of his reign is due to that able minister. [COLBERT, JEAN BAPTISTE.] The ruling principle of Louis XIV. was pure absolutism. The king, according to him, represented the whole nation; all power, all authority, were vested in him. "L'état, c'est moi!" was his well-known expression. This form of government, he said, was the best suited to the character of the nation, its habits, its tastes, its situation. In his written instructions to the dauphin he tells him that "all which is found in the extent of our dominions, of whatever nature it be, belongs to us. The monies in our treasury, as well as those which are in charge of the receivers and

treasurers, and those which we leave in the hands of our subjects for the purposes of trade, are all alike under our care. You must be convinced that kings are absolute lords, and have the full and entire disposal of all property, whether in the possession of the clergy or of laymen, and may use it at all times as wise economists. Likewise the lives of their subjects are their own property, and they ought to be careful and sparing of them. . . . He who has given kings to men has ordered them to be respected as his lieutenants, reserving to himself alone the right of examining their conduct. It is his will that whoever is born a subject should obey without discrimination or reservation. . . . The essential defect of the monarchy of England is that the prince cannot raise men or money without the parliament, nor keep the parliament assembled without lessening thereby his own authority." (*Œuvres de Louis XIV.*, vol. ii, Paris, 1816.)

Louis XIV. completed the work begun by Richelieu: he changed France from a feudal monarchy into an absolute one. Ximenes, Charles V., and Philip II. had effected the same change in Spain; but they had the clergy and the Inquisition to support and share their power, and the absolutism of Spain stood longer than that of France. Louis enticed the high nobility from their rural mansions, attracted them to court, employed them about his person, gave them pensions or placed them in his regular army, and completely broke down their former spirit of independence. With regard to the church, he distributed its temporalities to his favourites, both clerical and lay, bestowed livings and pensions and abbacies in commendam on courtly abbés, and thus rendered the clergy docile and subservient to the crown. He had several disputes with the court of Rome, in which he treated the pope with great asperity: twice he braved the pontiff, through his ambassador, in the middle of Rome [ALEXANDER VII.; INNOCENT XI.]; twice he seized upon Avignon, and twice he obliged the papal court to make him humble apologies. In his old age he became very devout, intolerant, and superstitious, and yet he mistrusted the papal court, and withstood its encroachments.

After the death of Mazariu, Louis admitted no more ecclesiastics into his council. The spirit of jealousy of the Gallican church made it less dependent on Rome and more subservient to the crown; and the hostility of the magistracy against the clergy furnished the king with an arm always ready to check any mutinous disposition in the clerical body.

The parliaments were also subdued, like the nobility and clergy, by the absolute will of Louis. When only seventeen years of age, in 1655, the parliament of Paris having made some remonstrances against an edict of the king concerning the coinage, he rode from Vincennes to Paris, entered the hall of the parliament, booted as he was, holding his whip in his hand, and, addressing the first president, told him that the meetings of that body had produced calamities enough, and that he ordered them to cease discussing his edicts. "And you, Mr. President," said he, "I forbid you to allow it." In 1657 Louis issued an edict forbidding the parliament of Paris from making any remonstrances concerning the royal edicts before registering them, and not until eight days after it had obediently registered them, after which the parliament might address him written remonstrances. From that time and to the end of his reign the parliament offered little or no impediment to the royal authority; it withdrew itself from state affairs, and confined itself to its judicial functions.

Having destroyed all opposition from the only orders which enjoyed any consideration in the state, Louis took care to make it known to the tiers état, or commons, that it was not for its advantage that he had humbled the privileged classes. In fact, he did not consider the tiers état as forming a class, but as an ignoble crowd of roturiers who were doomed to work for him and to obey his mandates, and from amongst whom he deigned from time to time to select some individuals as objects of his favour. In his celebrated edict of 1679, concerning duels, he speaks with the most insulting contempt of all persons "of ignoble birth" who are "insolent enough" to call out gentlemen to fight; and in case of death or serious wounds resulting therefrom, he sentences them to be strangled and their goods confiscated, and awards the same penalties to those gentlemen who shall presume to fight against "unworthy persons and for object causes." This law, most offensive to the great mass of the French people, was confirmed after Louis's death by the edict of February 1723, and continued in vigour till the fall of the old monarchy.

Louis established that system of centralisation in the administration which has been followed and rendered more complete by the various governments that have succeeded each other till our own days, and which renders France the most compact power in Europe: and in which the action of the executive residing at Paris is felt at every step by every individual in the most remote corners of the kingdom. He at the same time began the first labours for a regular system of legislation, by issuing separate ordonnances for civil and criminal process, for commercial matters, for the woods and forests, and for the marine, and which with all their imperfections formed the basis of distinct codes. The education of Louis had been very imperfect, and he was himself in great measure uninformed; but he encouraged science and literature, for which he was rewarded by numerous flatteries. His reign was a brilliant epoch of learning in France. With regard to the arts

he had more pomp than taste; he felt a pride in conquering obstacles, as the millions he lavished on Versailles, in a most unfavourable locality, amply testify.

Louis XIV. hated the Protestants, not so much from religious bigotry as because he considered them as rebellious subjects: he wanted uniformity in everything, in religion as well as politics. This led him to that most unjust and disastrous measure, the revocation of the edict of Nantes, in 1685, by which Protestantism was proscribed in France. France lost thousands of its most industrious citizens, who repaired to England, Switzerland, Holland, and Germany, carrying with them their manufacturing skill, and all the efforts of Colbert to encourage French industry were rendered abortive by that cruel and fanatical act, of which the revolt of the Cévennes and the war of extermination which followed were remote consequences. The persecution of the Jansenists was another consequence of Louis's intolerance.

The foreign wars of Louis XIV. proceeded in great measure from the same ruling principles or prejudices of his mind. He disliked the Dutch, whom he considered as mercantile plebeians, heretics, and republicans, "a body formed of too many heads, which cannot be warmed by the fire of noble passions" (*Instructions pour le Dauphin*, vol. ii, p. 201); and he carried his antipathy to the grave, without having succeeded in subjecting that small nation, whose wealth excited enemies against him everywhere. It is impossible not to be struck with the similarity of prejudices in two men, however dissimilar in some respects, Napoleon I. and Louis XIV. The hatred of Napoleon against England, which he designated as a nation of shopkeepers, was like that of Louis against the Dutch, and it produced similar results to his empire. The same determination of establishing uniformity in everything; the same mania for a unity and singleness of power, which both mistook for strength; the same ambition of making France the ruling nation of Europe under an absolute ruler, were alike the dominant principles, or rather passions, of the 'legitimate and most Christian king,' and of the plebeian 'child and champion of the Revolution.' Several of the plans and schemes of Louis XIV., relative to foreign conquests, were found in the archives, and were revived and acted upon by Bonaparte.

The first war of Louis XIV. against the emperor Leopold, Holland, and Spain, was ended by the treaty of Nymegen, 1678. Louis kept the Franche Comté and part of the Spanish Netherlands. The war broke out again in 1689, between Louis on one side, and the Empire, Holland, and England on the other. Louis undertook to support James II. in Ireland, but the battle of the Boyne and the capitulation of Limerick put an end to the hopes of the Stuarts, and James II. passed the rest of his life in exile at St. Germain-en-Laye, where he died a pensioner of the French king. In Germany Louis XIV. caused one of the most atrocious acts recorded in the history of modern warfare. This was no less than the devastation of the Palatinate by his commanders. A district of more than thirty English miles in length, with the towns of Heidelberg, Mannheim, Speyer, Oppenheim, Crutzenach, Frankenthal, Ingelheim, Bacharach, Sinzheim, and others, was ravaged, plundered, and burnt, in cold blood, under the pretence of forming a barrier between the French army and its enemies. A cry of indignation resounded throughout all Europe at the disastrous news. It was just about this time that James Stuart solicited, from his exile at St. Germain, the assistance of the emperor against William of Orange, in the name of legitimacy and the Catholic religion. Leopold in his answer observed, "that there are no people who injure so much the cause of religion as the French themselves, who on one side support the Turks, the enemies of all Christendom, to the detriment of the empire; and on the other, have ravaged and burnt innocent towns, which had surrendered by capitulations signed by the hand of the Dauphin: they have burnt the palaces of princes, plundered the churches, carried away the inhabitants as slaves, and treated Catholics with a cruelty of which the Turks themselves would be ashamed." (*Letter from the Emperor Leopold to James II.*, 9th of April 1689; in the *Mémoires de Jacques II.*, vol. iv.) In 1693 the unfortunate town of Heidelberg, which had been partly restored by the inhabitants, was taken again by the French marshal De Lorges, the women were violated, the churches set on fire, and the inhabitants in general, 15,000 in number, stripped of everything and driven away from their homes. On these news a 'Te Deum' was sung at Paris, and a coin struck, which represented the town in flames, with the inscription, "Rex dixit et factum est!" The treaty of Ryswick, in 1697, terminated the war, by which Louis gained nothing, acknowledged William III. as king of Great Britain, and restored the Duke of Lorraine to his dominions.

The third war of Louis was that of the Spanish succession. It began in 1701 and lasted thirteen years, convulsed all Europe, and was terminated at last by the peace of Utrecht in 1713. Louis succeeded in establishing a Bourbon dynasty in Spain, but this was the only advantage he gained; his armies had been repeatedly defeated by Eugene and Marlborough, his best generals were dead, his treasury was exhausted, his subjects were tired of war and of taxes, and he himself was broken down in health and spirits, a mere shadow of what he had been. He lingered about two years more, during which he legitimated his numerous natural children; made his will, by which he appointed his nephew, Philip, duke of Orleans, regent during the minority of his great-grandson and Louis XV.; fell ill in

August 1715, and died the 1st of the following September, seventy-seven years of age.

After divesting the character of Louis XIV. of the exaggerated praise bestowed on him by flattery or national vanity, after animadverting upon his numerous faults, and even crimes, it must be fairly acknowledged that he was a remarkable prince, and had many valuable qualities. He was active, intelligent, and regular in business; quick in discovering the abilities of others, an able administrator himself, endowed with a constant equanimity in adversity as well as prosperity, and a perfect self-command; a kind master, he was not prone to change his servants capriciously, was not harsh in rebuking them, and was ever ready to encourage merit, and praise and reward zeal for his service. Hence he had many faithful and devoted servants. His manner was noble, and his appearance imposing; he acted the king, but he acted it admirably, at least to the then taste of the people; he had a lively sense of decorum and outward propriety, which never forsook him. What he knew he learnt by himself: his natural gifts and the experience of his youth, passed among civil wars, made up for his want of learning and of study. If he carried his notions of absolutism to an extreme, he was evidently persuaded of his supposed right, and acted as much from a sense of duty as from inclination. In his reign of seventy-two years he reared the fabric of the absolute monarchy in France, which continued for seventy-two years more after his death; and when it was shaken to pieces in the storms of the Revolution, still the ruling principles of his administration, uniformity and centralisation, survived the wreck, and France is still governed by them.

LOUIS XV., born in February 1710, was the only surviving son of the Duc de Bourgogne, eldest son of Louis the Dauphin, son of Louis XIV. The dauphin died in 1711, and his son the Duc de Bourgogne died in 1712. The younger brother of the Duc de Bourgogne was Philip, duke of Anjou, afterwards Philip V. of Spain, who, except his nephew Louis XV., was the only legitimate descendant of Louis XIV. who survived that king. The mother of Louis XV. was Maria Adelaide of Savoy, who died in 1712. Philippe d'Orléans, son of Philippe de France, brother of Louis XIV., and the head of the actual Orléans branch of the Bourbons, was appointed regent. Louis XIV. had by his will appointed a council of regency, at the head of which was the Duc d'Orléans, but the parliament of Paris acknowledged the duke as sole regent. In gratitude the regent issued on the 15th of September a declaration, in the name of the king, restoring to the parliament the right of making remonstrances on the royal edicts, letters patent, and declarations, before it registered them.

The Duc d'Orléans had acquired an unfavourable reputation as a man of licentious habits, and as destitute of religious and moral principles. This corruption was partly ascribed to the Abbé Dubois, an unprincipled man, who had been his preceptor, continued to be his favourite, and was afterwards his minister. Vicious as the duke was, he was accused of crimes of which he was guiltless. The sudden death of the children and grandchildren of Louis XIV. at short intervals from each other had given rise to horrible suspicions, which have been since generally rejected. The 'Mémoires de St. Simon,' already quoted, which include the period of the regency, contain the most correct sketch of the character of the Duc d'Orléans, a character not rightly understood till the publication of that work.

The regent began well: he reformed several of the most outrageous abuses of the late reign; he liberated a number of individuals who had been for years immured in the Bastille; he enforced economy, reduced the army, supported the general peace of Europe, courted the friendship of England, concluded the triple alliance of the Hague in 1717, between France, England and Holland, and gave up altogether the cause of the Pretender. Unfortunately for him and for France, the disorder in which he found the finances, and the fearful deficiency in the revenue, made him listen to the wild schemes of Law, which ended in disappointment and the ruin of thousands of families. [LAW, JOHN.]

Philip V. of Spain, or rather his minister Alberoni, had encouraged a conspiracy against the Duc d'Orléans, the object of which was to excite a revolution against him, to deprive him of the regency by a resolution of the three estates of the kingdom, and to place Philip himself at the head of the regency. The plot was discovered, several of the leaders, who were chiefly in Brittany, were punished by death, and in 1719 the regent declared war against Spain. The war however did not last long: Alberoni was dismissed and banished by his sovereign, and Philip of Spain made peace with France in 1720. [ALBERONI.] In 1722 Dubois, who had been made a cardinal, became prime minister of France.

In February 1723, Louis XV., having completed his fourteenth year, was declared of age, and the regency of the Duc d'Orléans terminated. The same year Dubois died, and was followed to the grave by the Duc d'Orléans a few months after. The Duc de Bourbon, Condé, was made prime minister, and governed France until 1726. It was proposed to marry Louis XV. to Mademoiselle de Sens, the duke's sister; but she refused, and preferred a life of retirement to a throne. Louis married in 1725 Maria Leszinska, daughter of Stanislaus, ex-king of Poland, and in the following year the Duc de Bourbon was dismissed from the ministry, and the Abbé de Fleury, the king's preceptor, and

afterwards cardinal, was substituted for him. The seventeen years of Fleury's administration, which ended with his death in 1743, were the best period of the reign of Louis. [FLEURY, ANDRÉ HERCULES.] Fleury restored order in the finances, and credit and commerce revived. In 1733 the war of the Polish succession broke out, by the death of King Augustus II., when Louis XV. took the part of his father-in-law Stanislaus, the old rival of Augustus, against Austria and Russia, who supported the son of Augustus. [AUGUSTUS.]

The war was carried on between France and Austria both on the Rhine and in Italy. In the latter country the French, being joined by the Spaniards and the King of Sardinia, obtained great success. Don Carlos, son of Philip V., conquered the kingdom of Naples and Sicily, and thus a third Bourbon dynasty was founded in Europe. Peace was made in 1736, by which the duchy of Lorraine was given to Stanislaus for his life, to be united after his death to the crown of France. Francis, duke of Lorraine, had Tuscany in exchange. In 1741 the war of the Austrian succession broke out, in which France took part, against the advice of Fleury, who was overruled by the king and the courtiers. In 1743 Fleury died, and Louis declared that he would govern by himself, and without any prime minister. The war continued till 1748, when it was terminated by the treaty of Aix-la-Chapelle. France derived no advantage from this murderous and expensive war, and Maria Theresa remained in possession of her father's dominions. Louis XV. was present at the battle of Fontenoy, in May 1745, between the English, commanded by the Duke of Cumberland, and the French, commanded by Marshal de Saxe, in which both armies fought with the greatest obstinacy and suffered most severely; the French however claimed the victory.

In 1755 hostilities were begun by the English against the French in America, in consequence of disputes concerning the boundary-line between Canada and the English settlements. In the following year war was formally declared between the two powers. This war connected itself with the war in Europe called the Seven Years' War. The English were the allies of Frederick of Prussia, whilst the French joined the Empress Maria Theresa. This war proved most unfortunate to France. The French were beaten at Rosbach by Frederick in 1757, and were again defeated at Minden by the Duke Ferdinand of Brunswick, with the loss of 8000 men, cannon, baggage, military chest, &c. In America they lost Canada. A project of invasion of England by means of 6000 flat-bottomed boats, by which landings were to be effected on various points of the coast, was revealed to the English ministry by an Irishman called Macallister, and was abandoned. At last by the peace of Paris, February 1763, France formally ceded Canada, Nova Scotia, and its other North American colonies, besides Grenada, Dominica, and Tobago in the West Indies; its navy never after recovered from its losses, its finances were exhausted, and its commerce destroyed. This was the last war of Louis XV., a war which was undertaken rashly, and terminated in a disastrous and humiliating manner. The feeling of disgrace resulting from it sunk deeply into the heart of a people so vain and sensitive as the French, and it completely did away with the former popularity of Louis, which had once obtained him the title of 'Bienaimé,' or Beloved. The king had now abandoned himself to gross licentiousness, and had become careless of state affairs. The mad attempt of Damiens made him still more alienated from his people. [DAMIENS, R. F.] After the death of his mistress, the Marchioness of Pompadour, an ambitious intriguing woman, but who had still some elevation of mind, he became attached to more vulgar women [BARRY, MARIE JEANNE], and at last formed a regular harem after the fashion of the eastern sultans, but more odious from its contrast with European manners, which was called the Parc aux Cerfs, and upon which vast sums were squandered. The minister of foreign affairs, Choiseul, who had remonstrated with the king upon his degradation, was dismissed in 1770. He was the last man of some merit who served Louis XV. [CHOISEUL, ETIENNE FRANÇOIS, DUC DE.] The state of the finances was the most obvious difficulty of ministers, to whose remonstrances, urged sometimes in a tone of appalling and ominous seriousness, Louis used to answer, "Try to make things go on as long as I am to live; after my death it will be as it may."

Louis died at Versailles, on the 10th of May 1774, sixty-four years of age. Two sons whom he had had by his wife were both dead: the eldest, the dauphin, died in 1765, and left by his wife, a Saxon princess, three sons, who have been in succession kings of France, namely, Louis XVI., Louis XVIII., and Charles X. Louis XV. had also by his wife several daughters, besides illegitimate children.

It was under Louis XV. that the corruption of morals and principles spread in France to an alarming extent among all classes, being encouraged by the materialism and sensual philosophy which were taught by several men of letters. Both these causes, added to the general poverty, national humiliation, and ruined finances, prepared the way for the explosion which took place under his unfortunate successor.

(Lacretelle; Fantin des Odards; Voltaire, *Vie Privée de Louis XV.*)
LOUIS XVI., grandson of Louis XV., succeeded him in 1774, being then twenty years of age. He had married in 1770 Marie Antoinette, archduchess of Austria, sister of Joseph II. He chose for his minister of finance Turgot, an honest and enlightened man, who, in concert with his colleague Malesherbes, perceiving the temper of the times, wished the king to take the reform into his own hands, by abolishing

the *corvées* and other feudal exactions, equalising the direct taxes all over the kingdom, granting liberty of conscience and recalling the Protestants, reforming the criminal code, compiling a uniform civil code, giving freedom of trade, rendering the civil power independent of all ecclesiastical jurisdiction, suppressing the greater part of the convents, and establishing a new system of public instruction. These were the real wants of France; if they could have been satisfied, the revolution would have become unnecessary. But the clergy and the nobility strongly opposed these projects, the parliaments themselves were averse to changes which would reduce their own importance, and the old Count de Maurepas, who was also one of the cabinet, dissuaded the young king from them. Turgot was dismissed. Louis however, following his own natural disposition, effected much partial good; he abolished the *corvées* and the practice of torture, granted liberty of trade in corn in the interior of the kingdom between one province and another, made many reforms in the administration, established a system of economy and order, and gave the first example of it himself in his own household. He also granted toleration to the Protestants. But all these were little more than palliatives, and did not strike at the root of existing evils.

The deficiency in the treasury, and the debt of four thousand millions of livres left by Louis XV., were the great stumbling-block of Louis's administration. He however went on for some years, during which he engaged in a war against England, which was very popular with the French, humbled as they had been in the preceding struggle with that power. The object of this war was a singular one for an absolute monarchy to embark in: it was in support of the revolted colonies of North America, which had declared their independence of Great Britain, and it has been since generally regarded as a great political blunder on the part of the French monarch. On the 6th of February 1778 a treaty of commerce and alliance was signed at Paris between the French cabinet and Franklin and Silas Deane on behalf of the United States, by which the latter were acknowledged by France as an independent community. In the following May a French fleet under Count d'Estaing sailed for America, in June the first hostilities took place at sea, and on the 10th of July France declared war against England, and 40,000 men were assembled in Normandy for the invasion of England. This plan however was not carried into effect, because the French and Spanish fleets, which were to protect the landing, were dispersed by contrary winds. In America the French auxiliary troops, joined to the Americans, were successful against the English. [LAFAYETTE.] At sea many engagements took place between the French and English, both in the Atlantic and the Indian seas, without any very decisive advantage on either side; but on the 12th of April 1782 the French Admiral De Grasse was completely defeated by Admiral Rodney off the island of Dominica, with the loss of five ships of the line, and was taken prisoner. In September of the same year the attack of the French and Spaniards upon Gibraltar failed. [ARCON; ELLIOTT, GEORGE AUGUSTUS.] In September 1783 peace was concluded at Versailles; England acknowledged the independence of the United States, and gave up to France Tobago and the coast of Senegal.

Meantime the financial embarrassment of the French government went on increasing. Necker, a Genevese banker [NECKER], wealthy and retired from business, having become minister of finance in 1776, made many reforms, effected a new and more equitable assessment of the direct taxes, established provincial assemblies of notables, who apportioned the taxes, and put an end to the enormous gains of the *Fermiers-Généraux*. After five years of war his 'compte rendu' showed a surplus of ten millions of livres; he had borrowed 530 millions at a less interest than had ever been known in times of war; the discount on exchequer-bills, which had been 16 per cent, was reduced to 8, and all this without any addition to the burdens of the people. In November 1783, by a court cabal, Necker was dismissed, and Calonne, a more pliant and courtly person, was substituted. He managed to go on a little longer, involved himself in a dispute with the parliament of Paris, and at last, being unable to proceed any further, he proposed to the king to call together an assembly of the notables selected by the king from the various provinces, to consult upon the means of supplying the deficiency in the revenue, which Calonne stated to amount to 110 millions of livres. This assembly met at Versailles in February 1787, rejected Calonne's proposal of laying additional taxes upon property (the notables themselves were all landed proprietors), and proposed instead several measures, among others a loan on life annuities, and the formation of a council of finance. The king adopted their measures, and then dissolved the assembly. A paper war now took place between Necker and Calonne on the respective merits of their administrations, and Calonne, being detected by the king in a falsehood, was dismissed. Several successive ministers followed for short periods, but they could do nothing to retrieve the ruinous state of affairs, and at last Necker was recalled. He stated to the king that the only resource left was to call together the states-general of the kingdom, which had not been assembled since 1614. The king convoked them at Versailles in May 1789. These states had always consisted of the three orders—clergy, nobility, and the third estate, or commons. Every order formed a separate house, in which it discussed the measures proposed by the government, and decided by a majority of votes. By this means any project of law displeasing to the two privileged orders was sure not to pass those

two houses, and was therefore lost. Necker, to obviate this difficulty, proposed to give to the third estate a double vote, so as to balance the votes of the other two houses. The king, after some hesitation, gave this double vote to the third estate, and this was in fact the beginning of the revolution. It is remarkable that Monsieur, the king's brother, afterwards Louis XVIII. was one of those who supported this organic change.

On the 5th of May, the three estates having assembled in the common-hall, the king opened the session by a temperate speech, which was much applauded, after which the clergy and nobility withdrew to their separate rooms to deliberate among themselves. The third estate remained in the common-hall, and in the following sittings proposed that the three orders should assemble and deliberate together, which the other two refused. On the 10th the third estate elected Bailly for their president; and on the following day they were joined by several deputies of the clergy. On the 17th, on the motion of the Abbé Sieyès, the third estate, joined by many of the clergy, constituted themselves as a national assembly, and resolved that as soon as that assembly should be prorogued or dissolved all taxes not sanctioned by it should cease to be legal. The court was alarmed at these innovations, and the king announced that he was going to hold a royal sitting. Meantime the doors of the hall of the assembly were closed, and a guard placed there to prevent the deputies from entering. Bailly led them, on the 20th to the 'Jeu de paume,' where they swore not to separate until they had framed and enforced a new constitution for the kingdom, and the redress of existing grievances. On the 23rd the king convoked the three estates in the common-hall, and after qualifying the resolutions of the 17th preceding as illegal, ordered the estates to leave the hall, and withdraw each to their appropriate chamber, to deliberate there upon certain subjects which he laid before them. After the king's departure, the third estate, joined by part of the clergy, refused to leave the hall, and when the grand-master of the ceremonies came to enforce the king's order, Mirabeau answered him, that they were there to fulfil their duty towards their constituents, and that force alone should disperse them. On the 25th, part of the deputies of the nobility joined the third estate, and the name of National Assembly was publicly recognised.

The events that followed rapidly are too numerous and too generally known to be inserted in this article. The National Assembly, by the constitution it formed, changed the old French monarchy into a representative republic, with a single chamber and an hereditary magistrate with the name of king, whose power however was rendered insignificant and nugatory. They suppressed not only the feudal jurisdictions, but also the manorial dues and fees, the titles of nobility, the tithes, convents, and the corporations of trades; they confiscated the property of the Church; they abolished the old division of the kingdom by provinces, and ordered a new one by departments; they changed entirely the social relations of the country, so that even Mirabeau was startled at the rapidity with which they were legislating, and began to express ominous doubts of the result, (Dumont, 'Souvenirs de Mirabeau.') "It is easy to destroy," he said, "but we want men able to reconstruct." Paine's pamphlet on the supposed 'Rights of Man' was gravely assumed by that assembly as the basis of their political theory. Meantime insurrections broke out in Paris and in the provinces; not only the abominable Bastille was taken and destroyed (July 1789), but the châteaux, or manorial residences of the nobility, all about the country, were attacked and burnt, with many acts of atrocity. On the 6th of October the palace of Versailles was entered by a mob from Paris, the body-guards were murdered, the royal family were in great danger, and at last the king consented to remove to Paris, whither he was escorted by the armed populace. On the same day the famous club of the Jacobins began its meetings at Paris. The emigration of the nobles had already begun: several members of the royal family repaired to Germany and Italy. The year 1790 was passed amidst alarms and insurrections in the interior, and rumours of foreign war, amidst which the assembly continued its labours for the new organisation of France. It passed a law requiring of all the clergy the oath of fidelity to the new constitution: the pope forbade the oath as schismatic, and many of the French clergy refused to take it, but they were dismissed from their functions and replaced by others more docile, who however had not the confidence of the more religious among their flocks: thus religious schism was added to civil feuds. The king himself was obliged to send away his chaplains. He had by this time become weary of being a mere puppet in the hands of the assembly, which had despoiled him of almost every royal prerogative, even of the right of pardoning; the 'veto,' or power of suspending for a time the passing of an obnoxious law, had also become illusory, for whenever he attempted to exercise it an insurrection broke out, which, by frightening the court, obliged the king to submit.

In June 1791, Louis, with his consort, his sister, and his children, endeavoured to escape from France, but was stopped at Varennes, and brought back to Paris. In the following September the assembly, having completed the new constitution for France, presented it to Louis, who, after making some remarks on what he conceived to be its deficiencies, swore to observe it. This act acquired him a few moments' popularity: and the assembly, having stated that the object for which it had met was completed, closed its sittings on the

30th September. If that assembly committed errors, they were errors of judgment, for the majority were certainly sincere in wishing to maintain the kingly office, which they thought compatible with democratic institutions. Through a mistaken delicacy however they committed a very serious blunder before they parted; for they resolved that no member of that assembly should be eligible to the next assembly of the representatives of the nation, which became known by the name of the legislative assembly, and which was composed of much worse materials. The majority in the legislative assembly were men hostile to the monarchical principle altogether; they were divided between Girondins and Jacobins. They began by sequestrating the property of the emigrants; they issued intolerant decrees against the priests who would not swear to the constitution, and by these means obliged them to run away from France; they treated the king with marked disrespect, dismissed his guards, provoked the war against Austria and Prussia, encouraged republican manifestations in various parts of the country, and even in the army, established extraordinary courts to judge the emigrants and other people disaffected to the new order of things (the word "incivism" was invented to designate this new offence), and issued an enormous quantity of paper money, which quickly becoming depreciated, added to the general misery.

The king endeavoured, by the use of his "veto," to check this headlong career. An insurrection, in June 1792, was the consequence; the palace of the Tuileries was assailed and entered by the mob, which treated the royal family with the greatest insolence, threatened their lives, and obliged the king to put on a red cap and show himself at the window to the crowds below. A second insurrection, better organised, with the avowed object of abolishing the kingly office, was supported by a party in the legislative assembly. The mob again attacked the Tuileries on the 10th of August, and after a desperate defence by the Swiss guards, entered it, and massacred all the inmates. The king and royal family had time to escape and take refuge in the hall of the legislative assembly. The assembly deposed the king, sent him and his family prisoners to the Temple, proclaimed a republic, and convoked a national convention to exercise the sovereignty in the name of the people. In September the massacres of the political prisoners began; the cry of "aristocrat" became a sentence of death against any obnoxious person. On the 21st of September the national convention opened its session, and shortly after prepared to bring the king to trial. The principal heads of accusation were, his attempt to dissolve the states-general in 1789, his escape to Varennes, and other acts previous to his accepting the constitution of 1791. Since his acceptance of it there was no charge that could be substantiated against him except the exercise of the prerogatives given to him by the constitution, such as the "veto," and changing his ministers. The rest were mere insinuations and surmises of having bribed deputies, corresponded with the hostile powers, &c. The trial was opened in December. The Girondins and the Jacobins united against Louis, and he was found guilty of "treason and conspiring against the nation." The sentence was pronounced on the 16th January 1793. Of 721 members present who voted in the convention, 366 voted for death unconditionally, 288 voted for imprisonment and banishment, and the rest voted for death, but with a respite, hoping thereby to save his life. The majority which sent Louis to the scaffold was only five.

On the 21st of January 1793 Louis XVI. was taken in a coach to the Place Louis XV. where the guillotine was fixed. He appeared silent and resigned, and engrossed by religious thoughts. Having ascended the scaffold, he attempted to address the people, but Berruyer, the commander of the national guards, ordered the drums to beat. Louis then gave up the attempt, took off his coat and cravat, and laid his head on the block. He was beheaded at ten o'clock in the morning. His consort Marie Antoinette was tried, condemned, and beheaded in the following October. The character of that unfortunate princess has been rescued from unmerited obloquy and the malignity of her enemies by Madame Campan in her 'Mémoires sur la Vie privée de Marie Antoinette,' London, 1823. Louis left one son, styled Louis XVII., and one daughter, who married her cousin the Duke of Angoulême.

LOUIS XVII., Duc de Normandie, second son of Louis XVI., styled Dauphin after his elder brother's death in 1789, remained in prison in the Temple after the death of his parents, and there he died of disease, in consequence of ill-treatment and privation, on the 9th of June 1795. He was then ten years of age. He had been styled Louis XVII. by the royalists after his father's death.

LOUIS XVIII. (Stanislas Xavier), Count of Provence, born in 1755, was also styled 'Monsieur' during the life of his brother Louis XVI., who, just before his death, wrote to him, appointing him regent of France. After the death of his nephew Louis XVII. in 1795, he assumed the title of King of France and of Navarre, although he was then an exile, and he was acknowledged as king by the royalist emigrants, who composed a small court around his person. He had shown his liberal disposition in favour of rational reforms in France in the first period of the Revolution, but the violence of the Jacobins obliged him to emigrate in 1791. He lived for some time at Verona, in the Venetian territories, which he was obliged to quit when Bonaparte invaded Italy in 1796. He resided successively in various parts

of Germany, and at last settled at Warsaw, but in 1803 removed to Mittau in Courland, under the protection of Russia. By the peace of Tilsit (1807) he was obliged to leave the Continent, and he repaired to England, where he fixed his residence at Hartwell in Buckinghamshire till 1814, when events in France opened the way for his return to the throne of his ancestors. He landed at Calais in April of that year, and proceeded to St. Ouen, from whence he issued a proclamation acknowledging himself as a constitutional, and not an absolute king; promising the speedy publication of a charter, a total oblivion of all the past, and guaranteeing all the possessors of what was called national property. On the 4th of June he laid before both the senate and legislative body a charter which he had drawn up with the assistance of his ministers, and which was unanimously accepted, and became the fundamental law of the kingdom.

Louis was sincere in his professions, but he was surrounded by disappointed emigrants and old royalists, whose imprudence injured him in the public opinion; whilst on the other side he had against him the Bonapartists, a formidable body, including the greater part of the army. A conspiracy was hatched against Louis, Bonaparte returned from Elba, and Louis, forsaken by all, retired to Ghent [BONAPARTE, NAPOLEON I.] The battle of Waterloo (June 1815) opened again to Louis the way to Paris; but this time he appeared as an insulted and betrayed monarch. Those officers who, in spite of their oaths to Louis, had barefacedly favoured Bonaparte's usurpation, were tried and found guilty of treason; some were shot, and others exiled. The new Chamber of Deputies, which was elected under the excitement of this second restoration, proved ultra-royalist in principle, and went further than the sovereign. They banished all those who had voted in the convention for the death of Louis XVI., as well as those who had accepted office under Napoleon after his return from Elba. Meantime sanguinary reactions took place in various parts of France, especially in the south, where the old animosity of the Catholics against the Protestants was revived by political feuds. At last Louis himself saw the danger to which the violence of his pretended friends exposed him, and he dissolved the Chamber, which was styled 'La Chambre Introuvable.' In the new elections the moderate constitutional party regained the ascendancy, and the king in 1818 appointed a liberal ministry, at the head of which was Count Decazes. But the assassination of his nephew, the Duc de Berry [BERRY, JEAN, DUC DE], by a fanatical republican, in February 1820, again alarmed the court, and restored the influence of the ultra-royalists. Decazes was dismissed, and Villèle was placed at the head of the ministry. The law of election was altered, the newspapers were placed under a censorship, and other measures of a retrograde nature were adopted. No open violation of the constitution however was committed. In 1823 Louis, in concert with the Northern powers, sent an army into Spain under his nephew the Duc d'Angoulême, to rescue Ferdinand from what he termed his state of thralldom. [FERDINAND VII.] The expedition was successful; it restored Ferdinand to the plenitude of his power, but it did not succeed in restoring to Spain order and good government. In September 1824, Louis XVIII. died, having been a long time ill and unable to walk: he retained to the last his mental faculties and his self-possession. He left no issue, and was succeeded by his brother Charles X.

Louis had a tolerably cultivated mind, considerable abilities, and a pleasing address: his ideas were, for a Bourbon, enlightened and liberal, and in ordinary and settled times he would have proved a very respectable constitutional king; as it was, he managed to steer safely between extreme opposite parties, and in a most critical period. He published in 1823 the account of his emigration, 'Relation d'un Voyage de Paris à Bruxelles et Coblenz,' which is curious.

LOUIS PHILIPPE, King of the French, Duc d'Orléans and Chartres, and Count de Neuilly, was the eldest son of Louis Philippe Joseph, Duc d'Orléans, the Philippe Egalité of the Convention [ORLEANS, HOUSE OF], and Louise Marie de Bourbon, daughter of the Duc de Penthièvre.

Louis Philippe himself was born at Paris, October 6th, 1773. His youth was marked by many acts of benevolence, and the judicious training of Madame de Genlis was well calculated to draw out the good qualities of those who were brought up under her charge. In his infancy he bore the title of Duc de Valois and afterwards of Chartres. In 1791 the young Duc de Chartres, having been nominated to the colonelcy of the 14th regiment of dragoons, assumed the command of that corps. It is said that almost his first act of authority was the rescue from the fury of the mob of two priests, who had refused to take the oath at that time exacted by the government from all ecclesiastics. On this occasion he showed great tact and presence of mind, and he subsequently received the honour of a civic crown from the municipality of Vendôme for rescuing M. de Siret, an engineer of that place, from drowning. By these means he became popular among the French people. In August 1791 the young duke quitted Vendôme in command of his regiment for Valenciennes. Whilst he was stationed there, war was proclaimed against Austria, and in the April following he entered on his first campaign. He fought his first battle at Valmy on the 20th of September, and on the 6th of November was again engaged under Dumourier at Jenappes. At this period the Revolution was rapidly advancing to a crisis at Paris. A decree of banishment had been passed (October 1792) against

the Bourbon race; and though his father, the Duc d'Orléans, had renounced his titles and had been enrolled as a citizen under the name of Philip Egalité, his son in vain attempted to dissuade him from returning to Paris, where, having been made the dupe of the revolutionary party, and having voted for the death of Louis XVI., he was dragged to the scaffold in his turn, January 21, 1793. For seven months after this date the young duke remained at his post with the army; but in the following October the Committee of Public Safety summoned before them both the Duc de Chartres, and his faithful friend Dumourier. Aware of the sanguinary character of the tribunal before which they would have to plead, they fled to the Belgian frontiers, and made their escape into the Netherlands, then in possession of Austria. The Austrian authorities gladly received the fugitives, and even offered to bestow on the duke a commission in their army; but he refused to take up arms against his country, and retired into private life. In April he set out disguised as an English traveller, on a tour through Germany, and journeyed through Liege, Aix-la-Chapelle, Cologne, and Coblenz, towards Switzerland. The resources at his command were small, and he was beset by dangers wherever he went. His sister Adelaide, known in history as Mademoiselle d'Orléans, at the same time fled the country together with Madame de Genlis, and met her brother at Zurich. The authorities of that canton, in fear of the French government, declining to harbour them, the exiles took up their abode in Zug; but being discovered, the duke placed his sister and Madame de Genlis in the convent of St. Claire, near Baumgarten, adopted the disguise of a traveller, and started on a fresh journey of danger and adventure.

His funds were nearly exhausted, when he received from M. de Montesquieu the offer of a post as professor in the college of Reichenau, close by the conflux of the Upper and the Lower Rhine. He at once offered himself for examination, and was accepted, under the assumed name of M. Chataud, in October 1793. Here he remained eight months, during which he was engaged in lecturing on mathematics and geography. At this time he accepted the friendly offer of M. de Montesquieu of an asylum at Baumgarten, where he remained in concealment till the close of 1794. His retreat being again discovered, he next went to Hamburg, in the hope of being able to procure a passage to America: but being disappointed, he crossed over via Copenhagen to Norway, Sweden, and Finland, which he traversed almost entirely on foot, as far as the North Cape. Meantime the course of circumstances at Paris had changed, and the Directory became anxious to compromise matters with the Orléans family, by procuring their voluntary removal to America. For the sake of his two brothers, the Duc de Montpensier and the Comte de Beaujolais, who had been thrown into prison as dangerous subjects; and at the same time in order to procure the restoration of his mother's estates which had been confiscated, Louis Philippe (whom we shall henceforth term the Duc d'Orléans) accepted a passage to the United States, and having left the Elbe in September 1796, reached Philadelphia, where he was joined by his two brothers. The next year the three brothers spent in travelling through the western provinces of America. In the course of this excursion, the duke gained great repute for his medical skill, by lancing a vein in his arm in an attack of fever. He afterwards performed the same operation for an Indian chief; in reward for which he was allowed to pass the night upon the large rug at the feet of the wild sovereign and his relatives. Having made the acquaintance of Washington at Mount Vernon, they returned to Philadelphia, whence they proceeded to New Orleans, and thence to Havannah. Here the Spanish authorities declining to treat them with respect, or even with civility, they went on to the Bahamas, where the Duke of Kent was in command. His Royal Highness entertained them with true British cordiality, though he did not feel at liberty to grant them a passage to England in a man-of-war. Accordingly they took ship to New York, and crossing to England in a sailing packet, they landed at Falmouth in February 1800. The royal exiles were welcomed in London by the King, the Prince of Wales, Lord Grenville, the Marquis of Hastings, and the leaders of the politics and fashion of the day. An Orléans mania prevailed through London, and an invasion of France to effect the restoration of the Bourbons was even talked of. After a short time the brothers settled at Twickenham, in a house formerly occupied by General Pollock, and since known as Orléans Lodge.

The Duc de Montpensier, whose health had long been declining, died at Twickenham in May 1807, and was buried in Westminster Abbey. Soon afterwards the health of the Comte de Beaujolais failed also, and having gone to a warmer climate in obedience to the order of his physicians, accompanied by the duke his brother, he died at Malta in 1808. Being now rejoined by his sister, who for fifteen years had lived in retirement in Hungary, and by his mother, whom he met at Minorca, the Duc d'Orléans took up his residence at Palermo. It so happened that Ferdinand, king of Naples and Sicily, was dwelling in that city under the protection of the British flag, while Murat occupied his throne in Italy. During his residence there, he gained the affections of the Princess Amelie, the second daughter of the king, to whom he was married November 25, 1809. For upwards of four years the Duc d'Orléans resided at Palermo without taking any part in the public affairs of Europe, if we except a visit which he paid to Spain in 1810, in the illusive idea that negotiations commenced by the Spanish and English authorities might eventuate in

an offer on their part to entrust to his hands the regency of that country.

In 1814 tidings reached Palermo of the downfall of the emperor Napoleon I., and of the intended restoration of the Bourbons. The duke returned to Paris without delay, and was reinstated in his honours and military rank. The return of Napoleon in the early part of the following year again disturbed the tenor of his life; and having sent away his family to England for safety, the duke took the command of the army in the north in obedience to the orders of Louis XVIII. Rather than endanger the peace of France by family feuds, he resigned his command in the following March, and retired to Twickenham, whence he returned to Paris after the Hundred Days, in obedience to a decree compelling the attendance of princes of the blood in the Chamber of Peers. He conciliated the popular esteem and respect by liquidating the debts of the Orléans estates, and by other politic measures. Louis Philippe, in his place in parliament, publicly protested against the extreme measures proposed by the government against those who had taken part in the revolution, and procured their rejection. Louis XVIII., who regarded him with especial jealousy, in disgust and revenge, forbade princes of the blood royal to appear in the Chamber of Peers. The Duc d'Orléans revenged himself upon the court by entering his son in one of the public colleges as a simple citizen of Paris. He returned to England, and continued to live in privacy at Twickenham during the remainder of that king's life and the first few years of the reign of Charles X. He did not return to France until 1827, when he took up his abode at the palace of Neuilly, where he continued to live in seclusion until the year 1830, when the revolution occurred which ended in his elevation to the throne as King of the French. Charles, whose weakness and duplicity were his ruin, was now in effect discredited; and the cause of the elder branch of the Bourbons being pronounced hopeless, the struggle of the three days of July was followed by a provisional government, in which Lafayette, Lafayette, Thiers, and other politicians, took the lead. They naturally turned to the Duc d'Orléans, and in the name of the French people offered to him the crown. After a day's deliberation he accepted it, and came to Paris on the 31st of July; and, the preliminary forms having been passed through, on the 9th of August the crown was formally accepted by the Duc d'Orléans, who was proclaimed as Louis Philippe. For seventeen years he sat on his elective throne, and if an increase of the wealth and physical progress of a nation be a test, the results of his reign may be advantageously compared with those of the first empire. Peace was preserved abroad, order was maintained at home, and commerce increased steadily. His foreign policy was in like manner successful: his sons, the Duc de Nemours and the Prince de Joinville, carried the French arms into Algeria; Abd el-Kader was made a prisoner, and the Bey of Constantine forced to sue for peace, after a spirited resistance, and Algiers became a French military colony. Yet the king was not popular at home. He was hated alike by the Legitimist party, in whose eyes he was but a usurper, and by the revolutionists, who sighed for entire emancipation from kingly rule. Besides, there are deep and dark stains upon the reign of the "Napoleon of Peace," as Louis Philippe liked to be called. His reign was a period of corruption in high places, of jealousy and illiberal restriction towards his own subjects, of a fraudulent and heartless policy towards the allies of his country, whose goodwill he more especially forfeited by his over-reaching conduct in regard to the marriage of the Duc de Montpensier to a Spanish princess. And thus it came to pass that the heart of the nation became alienated from their king; and when a trifling disturbance in February 1848 was aggravated into a popular riot through the audacity of a few ultra-republicans, Louis Philippe felt that he stood alone and unsupported as a constitutional king, both at home and abroad, and that the soldiery were his only means of defence. He shrunk from employing their bayonets against his people: he fell in consequence, and his house fell with him. The king fled in disguise from Paris to the coast of Normandy, and taking ship again found a safe refuge on the shores of England, to which his family had already made their escape. He landed at Newhaven, March 3rd 1848. The Queen of England—who, in 1843, had enjoyed the hospitality of Louis Philippe at the Château d'Eu, his royal residence near Dieppe, and who had entertained him in the following year at Windsor, and conferred on him the order of the Garter—immediately assigned Claremont, near Esher, as a residence for himself and his exiled family. From the time of his arrival in England, his health began visibly to decline, and he died on the 26th of August 1850, in the presence of Queen Amelie and his family, having dictated to them the conclusion of his memoirs, and having received the last rites and sacraments of the church at the hands of his chaplain. He was buried on the following 2nd of September at the Roman Catholic chapel at Weybridge, Surrey, and an inscription was placed upon his coffin, stating that his ashes remain there, "Donec Deo adjuvante in patriam avitos inter cineres transferantur."

LOUTHERBOURG, PHILIP JAMES DE, a distinguished landscape painter, born at Strasbourg on the 31st of October 1740, was the son of a miniature painter who died at Paris in 1768. He at first studied under Tischbein, afterwards under Casanova, whose name as an historical painter was then in great vogue. While his own peculiar

forte lay in landscape, he was enabled by his education to give to that branch of the art a greater compass and range of subjects than usual, as in his various battle and hunting pieces, besides others that claim to be considered as strictly historical in subject; for instance, his 'Storming of Valenciennes,' and 'Lord Howe's Victory in June 1794.' His works are stamped by great vigour and mastery of pencil, and by excellent management in regard to composition. After having obtained considerable reputation at Paris by the works which he exhibited at the Louvre, and having been admitted a member of the Academy there in 1768, Louthembourg came over to England (where he was afterwards elected a Royal Academician) in 1771, and was engaged as scene-painter at the Opera-House, a department of art for which his vigorous style of execution, his poetical imagination, and his knowledge of scenic effect well qualified him. Soon after his settling in this country, Louthembourg got up, under the name of the 'Eidophusikon,' a novel and very ingenious exhibition, displaying the changes of the elements and their phenomena in a calm, a moonlight, and a sunset and a storm at sea. Of this very interesting pictorial contrivance, which may be said not only to have anticipated, but in some respects to have surpassed our present dioramas, although upon a smaller scale, a tolerably full account is given in Pyne's 'Wine and Walnuts.' His best landscapes are his views of Lake and Coast scenery. Louthembourg etched several of his own compositions. Late in life Louthembourg became a disciple of the 'prophet' Brothers [BROTHERS, RICHARD], and even set up as a prophet and curer of diseases on his own account; but the mob having broken the windows of his house at Hammersmith on account of the failure of some of his promises, which he had announced by a public advertisement, he thenceforth abandoned the publication of his predictions. He died at his residence at Hammersmith-terrace, on the 11th of March 1812.

LOUVOIS, FRANÇOIS-MICHEL-LETELLIER, MARQUIS DE, Prime Minister to Louis XIV., during the more brilliant part of his reign, was born on the 18th of January 1641, at Paris. His father, the Chancellor Letellier, the subject of one of Bossuet's 'Oraisons Funèbres,' served the same monarch in high offices of trust, during a course of forty-one years, until his death in 1685. So powerful was Letellier's influence at court, that as early as 1654, when the youth François-Michel was only in his fourteenth year, the king consented that the office of secretary of war, then filled by the father, should in due time be transferred to the son, the youth being trained to all his duties in the interim under his father's eye. He married in 1662 Anne de Souvère, marquise de Courtanvaux, who brought him an ample fortune and great connections. Hitherto he had been of idle habits, but he henceforth became remarkable for the diligence with which he prosecuted his duties. Nothing was in fact left unexplored which belonged to his military functions, nor did any abuse escape his vigilance, while for every evil which he denounced he was ready with a remedy. He thus gradually won the esteem of the king, who was induced to believe that he had in some sort formed the minister whose abilities were so eminent, while to the last Louvois used to flatter the monarch by intimating that all his most successful measures had really emanated from the suggestions of his Majesty. At first the office of war minister had been held jointly by Louvois and his father, but from 1666 until 1691, comprising all the chief campaigns of Turenne, and several of the most brilliant of those of Condé [LOUIS XIV.], Louvois alone directed the administration of war. Meanwhile a still greater minister, Colbert, was expanding to the utmost all the resources of the kingdom.

In 1667 the king opened the campaign, with the Vicomte de Turenne as second in command, and captured several fortified places, which Louvois was afterwards commissioned to garrison with French troops. In 1668 the conquest of Franche Comté increased his credit, and he was made Surintendant-Général des Postes. In 1671 he became Chancelier des Ordres du Roi; in 1673, Administrateur-Général des Ordres de Saint-Lazare et du Mont Carmel, and then Grand Veneur, or Master of the Hounds—honorary places awarded to him for his services, but none of which remained secure in the hands of a man whose energy seemed indefatigable. Whatever may and must be said of his ambition, his lust of power, and disregard of the French people, whom he oppressed with burdens, it must be acknowledged that the military glory of Louis XIV. was mainly due to Louvois. It must also be added to his credit that he founded some hospitals, restored others, and provided asylums for hundreds of old and disabled officers. It was he who conceived the plan of the Hôtel des Invalides, and began its erection in 1671.

The arrogance of Louvois rendered him as unpopular with the courtiers as his harsh measures did with the people. His hatred of Turenne is said to have led him to thwart and impede that commander's great military successes when they were at their height; and to Louvois, rather than to Turenne, recent historians have attributed the atrocious devastation of the Palatinate. [LOUIS XIV.] But Louvois shared in the honours of the capture of Ghent (March 4th, 1678), his own plan having been preferred for the siege of the place. The peace of Nimègue being concluded in 1678, the minister was at length able to turn his attention to domestic improvements. A war of twelve years' duration had not yet exhausted those resources and expedients which the sagacity of Colbert had collected; and, prompted by Louvois, the king commenced the foundation of those national

edifices which have ever since been identified with his name. The palace of Versailles, the two Trianons, the magnificent Place Vendôme, where Napoleon's column of Austerlitz now stands, and the great aqueducts of Maintenon, involving an outlay of many millions sterling, were all erected at the instigation of Louvois. This prodigal expenditure, after the great charges of the war, was vainly resisted by Colbert, who, having to provide the means to support it, was compelled to lay heavy burdens on the people, whereby he became the object of unmerited aversion during the last days of his life. [COLBERT.]

On the death of that illustrious financier, September 6th, 1683, the power of Louvois became almost absolute. Colbert had always fostered and protected the Protestants, even against the king, who disliked them. This was enough to provoke Louvois to persecute them, from a feeling of rivalry. He began by employing Roman Catholic missionaries to argue with the reformed (les réformés); but this was too slow for his impatience, so he replaced them by dragoons. A ruthless system of extermination was begun: the unhappy Protestants in vain sought concealment in the woods and amidst the rocks; men, women, and children were killed unarmed, sometimes singly, at others in families or parties. To one governor of a province Louvois wrote—"His Majesty orders you to employ the utmost rigour against those who refuse to be converted." In October 1685, chiefly by means of this inflexible man, the Edict of Nantes, which Henri IV. had passed to secure the lives and estates of his Protestant subjects, was revoked—a measure which dealt a fatal blow to the interests of agriculture and commerce, and was not unfelt either in the army or navy. This revocation was followed by a vast emigration: great numbers of Protestants of every rank fled from France, more particularly those who belonged to trade and commerce.

A new league, headed by the Prince of Orange, was formed against Louis XIV., and the war was renewed. In October 1688 Philippsburg surrendered to Louvois and Vauban after a siege of nineteen days; after which several other fortresses fell into their hands. In February 1689 the Palatinate was invaded a second time, the open country wasted, the towns and villages burned, and all the licence of war indulged in still more inhumanly than during Turenne's campaign of 1674-75. This war, fanned by religious discord, extended so rapidly as soon to embrace Germany, Holland, Belgium, Italy, and a part of Spain; whilst the active minister found means to raise well-appointed armies for each, without regard to the clamour of the suffering people. Stern and cruel as he was, his reputation for capacity increased; even his enemies acknowledged his talents and his vigour. Meanwhile every year strengthened the confederacy against the French monarch, and the Prince of Orange, now become king of England, united his troops to the armies of the allies, whilst his fleets threatened the French coast along the whole seaboard. But the minister's fall was approaching. After the campaign of 1691 had been opened by Louis XIV., and during the siege of Mons, Louvois, whose long administration had raised his pride above all bounds, ventured to provoke his master by repeated contradictions. After the capture of Mons, Louvois followed the king to Versailles, and resumed his usual functions; but the frigid behaviour of Louis made him sensible that his power was drawing to an end. Still he persisted in going to the palace; though on one occasion, it is said the king was so incensed at his arrogance as to lift his hand against the minister, but Madame de Maintenon interposed to prevent the indignity. From the disgrace of dismissal he was however saved by his sudden death. His health, broken by prolonged labour and anxiety, had wholly given way under the repeated mortifications he had lately been made to endure. Having fainted in the royal council-room at Versailles, on the 16th of July 1691, he was removed to his hotel, where, after being bled, he expired in the course of a few hours. The Marquis de Louvois was then in his fifty-first year, and had been thirty-six years in the service of the 'grand monarque.'

LOVAT, LORD. SIMON FRASER, afterwards Lord Lovat, was born in 1668, at Beaufort, near Inverness, in Scotland. He belonged to the family of the Frasers, who were powerful as early as the reign of Malcolm IV. about 1153, and who had large possessions in Tweeddale and elsewhere in the south of Scotland. Simon Fraser's father died when his son was very young. After receiving the usual instruction at a grammar-school, he was sent to the University of Aberdeen, where he distinguished himself by his acquirements in classical learning.

In 1692 Fraser, through the interest of the Marquis of Athol, received a commission as captain of a company in Lord Tullibardine's regiment, but soon afterwards resigned in consequence of a dispute with the marquis, who was grandfather to the eldest daughter of the last Lord Lovat, and claimed the estates for her. Simon Fraser, on the contrary, asserted his own right, as nearest male heir, not only to the estates, but to be chief of the Frasers. In 1694 he succeeded in winning clandestinely the affections of the heiress, then fifteen years of age, and living with her mother, the dowager Lady Lovat, near Inverness, and she consented to elope with him. She did elope, but the man whom Fraser had engaged to conduct her changed his mind, took her back, and disclosed the plot to Lady Lovat. The heiress was immediately sent under an escort to Dunkeld, the seat of the Marquis of Athol. Fraser made some daring efforts to obtain possession of her, but without success.

About 1700 Fraser went to France, and to ingratiate himself with

James II., then living at the court of St. Germain, formally renounced the Protestant faith, and embraced that of the Roman Catholics. James II. having died in 1701, his son, James Francis Edward, resolved to make an attempt to regain his father's kingdom, and Fraser was appointed by the courts of Versailles and St. Germain to stir up an insurrection in the Highlands of Scotland. He was made a colonel (some say a major-general), was furnished with credentials to treat with noblemen, gentlemen, and chiefs of clans, and was supplied with arms, ammunition, and money. He embarked at Dunkirk, and landed in Scotland about the end of 1702. He pretended to perform his engagement, but after his return to France in 1703 it was discovered that he had abused his trust, and had disclosed the plot to the Duke of Queensbury. He was confined in the Bastille, where he remained till 1708, when, in order to obtain his release, he offered to enter into holy orders. By the influence of the pope's nuncio and other Roman Catholic clergymen he was set at liberty, took orders, retired to St. Omer, entered the College of Jesuits, and discharged for some years the duties of a priest with apparent sincerity and much diligence.

When the Rebellion broke out in 1715 Fraser repaired to London, and with some difficulty and risk got to the Highlands of Scotland under the assumed name of Captain Brown. His great object was to obtain his hereditary estates. A large part of the clan of the Frasers received him as their chief, and were willing to act according to his decision; and as Fraserdale, who had married the heiress and held the estates, had joined the Pretender, Fraser adhered to the king. He took Inverness from the rebels, and after the rebellion was suppressed his services were rewarded with the title of Lord Lovat and the grant of the forfeited estates.

In 1717 Lord Lovat married a daughter of the Laird of Grant, and by her had two sons and two daughters, who survived him. His wife having died, he married a young lady nearly related to the Argyll family, and had a son by her, but treated her with so much cruelty that a separation was the consequence. He was appointed governor of Inverness and lord-lieutenant of Inverness-shire, and lived in tolerable quietness till the second rebellion broke out in 1745, when he joined the side of Charles Edward, the young Pretender, but kept himself at home, and sent his son with the Frasers, pretending, in his reply to the Lord President, who, on the 28th of October 1745, wrote to reproach him, that his son had acted without his authority. There was however abundant evidence of his participation, and he fled and concealed himself in the wildest parts of the Highlands; but after many escapes he was caught and conveyed to London. He was confined in the Tower, and was not brought to trial till the 9th of March 1747. The trial lasted seven days, and he was then found guilty and sentenced to be beheaded. Both before and after his trial he amused every one near him with his jests. When he had received sentence he exclaimed on quitting the bar, "Farewell, my Lords, we shall never all again meet in the same place;" a retort which, as Lord Mahon notices, is transferred by Byron, without acknowledgment, to his Israel Bertuccio. ('Doge of Venice,' act 5, scene 1.) On the 9th of April 1747 Lord Lovat was led to the scaffold on Tower-hill. He was then eighty years of age, and after sitting awhile in a chair, and talking deliberately to those about him, he laid his head quietly down on the block, and gave the sign quickly; and though he was very fat and his neck unusually short, his head was cut off at a single blow.

LOVELACE, RICHARD, born in 1618, was the son of a Kentish knight. Educated at the Charterhouse and at Oxford, he was placed at court, and entered the army under the patronage of Goring. On the close of the civil war, he retired to his paternal seat, Lovelace Place, near Canterbury. The county deputed him to present their petition in favour of the king to the Long Parliament; and for doing this he was imprisoned in the Gatehouse, and released only on giving bail in forty thousand pounds. In 1646 he raised a regiment in the French service, commanded it, and was wounded at Dunkirk; and it is said that the lady he celebrated in his poems married another person, on a false report that Lovelace had died of his wound. Returning to England in 1648, he was again imprisoned, and remained in confinement till after the king's death. In 1649 he published a volume of poems, entitled 'Lucasta's Odes, Sonnets, Songs,' &c. He had spent his fortune freely in serving the Royal cause. He now fell into embarrassment and sickness, and lived for some years wretchedly. He died of consumption, in a mean lodging in Gunpowder-alley, Shoe-lane, Fleet-street, London, in 1658, and was buried at the west end of St. Bride's church. Lovelace was the author of two plays, which have never been printed. His lyrical poems, with much inequality and many other faults, are full of spirit and vigour. Specimens of them are in all the common collections; and one or two of them, such as the fine verses 'To Althea from Prison,' furnish some of the most hackneyed of quotations.

* LOVER, SAMUEL, painter, novelist, poet, and musician, was born at Dublin in 1797. His earliest successes were in painting, and were sufficiently marked to secure his election as academical of the Royal Hibernian Academy of Arts in 1828. A portrait of Paganini, exhibited in the Royal Academy, London, in 1833, procured Mr. Lover various commissions; but a roving taste seconding varied accomplishments, induced him to almost abandon art. Literature succeeded, and the 'Legends and Stories of Ireland,' and the novels 'Rory O'Moore' and 'Handy Andy,' obtained equal success in their way. During these

years Mr. Lover had written and composed very many ballads, since published in a volume. He was also the author of several light dramas and operettas. In 1844, in an entertainment called 'Irish Evenings,' Mr. Lover illustrated Irish life with his own songs and music; and the great success which he obtained led to his making a visit to the United States. Mr. Lover's literary services have been recognised by a pension from government, which he now enjoys in rural retirement.

LOWTH, WILLIAM, born 1661, is the elder of two divines of the Church of England, father and son, both distinguished by eminent attainments in biblical literature and by their useful publications. The elder is the less eminent, though he is supposed to have been the profounder scholar; but he lived less in the public eye, and attained to none of the dignities which were bestowed on the son. Early in life he became chaplain to Mew, bishop of Winchester, who gave him a prebend in the cathedral of Winchester, and the rectory of Buriton in that diocese, where he lived, died, and was buried. He had been a pupil of Merchant Taylors' School, whence he had passed to St. John's College, Oxford. He died in 1732.

If we would form an idea of the extent of his laborious reading, we must look rather to the works of other persons than his own, and particularly to Potter's edition of the works of Clemens Alexandrinus, and Hudson's edition of the works of Josephus. To both these editors he communicated valuable notes. Of his own writings, those which are now most read are his 'Directions for the Profitable Reading the Holy Scriptures,' which was first published in 1708, and has been often reprinted, and his 'Commentary on the four greater Prophets.' This last-named work usually accompanies Bishop Patrick's Commentary on the other books of Scripture, to which it was prepared as a supplement.

LOWTH, ROBERT, a prelate of the English Church, son of the Lowth last named, and, like his father, distinguished by his knowledge of the books of Scripture and his valuable writings in illustration of them, was born in 1710. He was educated in the school of Winchester founded by William of Wyckham, whence he passed to New College, Oxford, which was also founded by the same munificent prelate. He went abroad with members of the Dartmouth and the Devonshire families, who, especially the latter, favoured his advancement in the Church; and having the good fortune to secure also the patronage of Hoadley, bishop of Winchester, he rose by regular gradations till he became Bishop of London, and in a situation to decline the offer which was made to him by King George III. of the archbishopric of Canterbury. A few dates of his preferments may suffice. Early in life he had the rectory of Ovington; in 1750 he was made Archdeacon of Winchester; in 1753 rector of East Woodhay in that diocese; in 1766 he became Bishop of St. David's; in the same year he was translated to Oxford; and in 1777 he was made Bishop of London. He died in 1787.

In speaking of the writings with which Bishop Lowth has enriched the literature of his country, we shall pass over his minor tracts, even those which belong to his controversy with Bishop Warburton, arising out of a trifling difference of opinion respecting the Book of Job. The controversy was conducted on both sides with a virulence rarely witnessed in these days in the disputes of literary men, and the pamphlets may be recommended to any one who can relish angry disputations seasoned by learning and wit. Writings on which we can dwell with greater satisfaction are his 'Life of William of Wyckham,' first published in 1758, a good specimen of the results to be attained by curious and recondite biographical research; and his 'Lectures on the Poetry of the Hebrews,' which were delivered by him in the university when he was professor of poetry. These lectures may be said to have opened an almost new subject, little attention having been previously paid to the laws of Hebrew poetry, or even to the fact that large portions of the books of the Old Testament are poems, in the strict and proper sense of the word, though presented to the English reader in a mere prose version, and as if there was no difference between them and the parts of those Scriptures which are really prose. They were received when published with great respect by the learned, not of England only, but of the Continent, where they were reprinted, with a large body of valuable notes, by the learned biblical scholar, J. D. Michaelis. These lectures were published by Lowth in Latin, the language in which they were delivered, but there is an English translation of them by Dr. Gregory, published in 1787. In 1778, the year after he was promoted to the bishopric of London, he published a 'Translation of the Prophet Isaiah,' distinguishing the poetical from the parts written in prose, and exhibiting the various forms of Hebrew parallelisms which occur in that prophet, and which he had explained and illustrated in his lectures. He gave a large body of valuable notes. These were his greater works; but he published also an 'Introduction to English Grammar,' which was thought valuable at the time, and was often reprinted, but is now nearly superseded and forgotten. There are also a few poems of his, chiefly in the nature of academical exercises, which in their day were greatly admired. A volume containing memoirs of his life and writings was published soon after his decease.

LOYOLA, IGNATIUS, DON INIGO LOPEZ DE RECALDE, more generally known under the name of Loyola, was the youngest child of Don Bertram, lord of Oñez and Loyola, a nobleman of high birth and distinction in his province, and of Marina Saéz de Baldi. He was born

in the year 1491, at the castle of Loyola, in that part of Spanish Biscay afterwards called the province of Guipuscoa. In early youth he was attached to the court of Ferdinand and Isabella, in the quality of a page; but the vivacity of his disposition little suited him for a situation so devoid of excitement, while the recital of the noble deeds of the Spanish knights, who had lately freed their country from the yoke of the infidel, rendered him desirous of emulating their fame. His father, when he sent him to the court of Spain, had placed him under the care of his relation, Don Antonio Manriquez, duke of Najara. This nobleman, perceiving the military bias of his young ward, got him instructed in the art of war, and afterwards received him in his suite. The ardent imagination of Ignatius was in the meanwhile kept in constant excitement by the eager perusal of the various romances in which were idealised the religious spirit of Spanish chivalry; to this was added the example of his brothers, who were following with distinction the profession of arms. After joining the army he soon rendered himself conspicuous by his gallant bravery on every occasion; his conduct, in other respects, is described as having partaken in all the dissipations generally incident to a military life; one vice however, that of gambling, he appears constantly to have avoided.

He was in his thirtieth year when he assisted in the defence of Pampeluna, against the French; in the assault he was severely wounded, his right leg having been fractured by a cannon-ball, and his left, at the same time, injured by a splinter. The French, into whose hands he had fallen prisoner, respecting his misfortune and admiring his bravery, had him conveyed to the castle of Loyola, which was situated at a small distance from Pampeluna. A long and painful confinement was the result of his wounds, and a cruel operation was resorted to, which, though endured with characteristic courage, reduced him to the last extremity. His recovery from the effects of the operation, though he saw in it a miracle, appears to have produced no change of conduct. A second operation however became necessary, owing to a deformity which had resulted from the first, and its consequences entailed a longer and more tedious confinement. To relieve its weariness he requested to be provided with those records of ancient chivalry which had been the delight of his former years, but instead of them he was furnished with works of mystical devotion and the lives of saints. Of a disposition naturally visionary and romantic, deprived of the means of pursuing a career in which he hoped to attain the highest honours, the attentive perusal of these records of the zeal and suffering of holy men infused in his mind an ardent desire to imitate them. As he eagerly pondered over the recital of the actions of a St. Dominick, or a St. Francis, he was wont to ask himself what prevented him from imitating their deeds? But often were these heavenly aspirations clouded by the intervention of worldly thoughts and of temporal affairs. At other times, when in this spiritual combat the spirit was obtaining a mastery over the flesh, his vivid imagination would portray to him visions of celestial glory which, in that hour of struggle, encouraged and inspired him. He has graphically described the various scenes through which he passed in his introduction to a religious life, in his 'Spiritual Exercises,' the origin of which may be referred to the same time as his first awakening from worldly slumber. This remarkable work is not a book of doctrine, it is the description, to use his own words, of "the longings of a soul seeking to be appeased, not by much knowledge, but by the sense and relish of inward things." He first minutely details a variety of rules for the guidance of spiritual life; he then exhorts to the study of sacred history, to whose events he too frequently gives a fanciful interpretation; he afterwards gives an allegorical representation of the convert's progress from the prison of this world to the realms of celestial bliss. Loyola but detailed his own feelings in this extraordinary production.

From this time all his desires were directed to one great object, an entire devotion to the service of God. For this purpose, renouncing all worldly pursuits, he tore himself from the paternal home, from his kindred, and from his friends. Regardless of the kindly opposition of his eldest brother, become by the death of his father the head of the house of Loyola, he resolved upon retiring to a Benedictine monastery at Mount Serrat, in order to prepare himself for a pilgrimage to the Holy Land. He became acquainted in that monastery with one of the brothers named John Chanones, of high reputation for austere and self-denying piety, and he was anxious to unfold to him the confession of his former sins and the confidence of his religious aspirations. While journeying towards Mount Serrat, he arrived at a village at the base of the hill on which it is situated, and he was then struck with the reflection that, though a destined pilgrim for Jerusalem, he was still clad in the garments of Babylon, and he exchanged his usual dress for the coarse raiment of a beggar.

The night of the 24th of March 1522, the vigil of the Annunciation, was a memorable period in the life of Loyola; he passed it in the exercise of the most austere devotions in the church of the Holy Virgin at Mount Serrat; on its altar he hung up his arms, the trophies of his worldly triumphs, and, in the spirit of chivalry, vowed constant obedience to the demands of God and of his church. The better to put into execution his holy resolutions he determined to perform barefoot his intended pilgrimage, in order that this severe penance might excite in his mind a deeper remorse for sin. On leaving Mount Serrat, he directed his steps towards Manresa, a small town within

three leagues of this monastery. There he repaired to the hospital of the Dominican convent, and, while attending upon the poor and sick, imposed upon himself a series of new and severe penances. His deeds of charity soon acquired for him celebrity in that town, and, though clad in the rags of destitution, he was unable to walk the streets without attracting the importunate admiration of the multitude. To avoid the temptation of vain glory, he retired to a cavern hollowed in a rock at a short distance from Manresa, where he redoubled the severity of his penances, and was one day found in a state of inanimate exhaustion at the door of his cell, and was borne back to the Dominican hospital. On his recovery, his mind, weakened by mortifications and fastings, fell into a state of spiritual despondency. His doubts and despair, his fears and temptations, are described with edifying minuteness in his own writings and by his early historians. It does not appear that any particular doctrine had made an impression on the mind of Loyola. He lived, as it were, within himself, and his emotions were actuated by the alternate inspirations of good and evil; he has taught us in his 'Spiritual Exercises' the manner in which he distinguished their influences; the soul being gladdened by the one and depressed by the other. One day, at length, he awakened as from a dream, his imagination had portrayed to his mind the visible representation of heavenly mysteries. With tears of joy, he gratefully acknowledged the blessings vouchsafed to him, and, refreshed in spirit, he arose a new and a mightier man.

After residing ten months at Manresa, he left that town for Barcelona, from whence he embarked for Rome. In that city he remained a few days, in order to obtain the blessing of the Pope Adrian VI. upon his enterprise; he then resumed his journey, passing through Padua and Venice, travelling alone and on foot, fasting daily, and begging alms as he went. His voyage from Venice to Cyprus presented a fresh trial for his patience and constancy, his pious efforts for the conversion of the crew of the vessel in which he sailed being met by coarse insults and contumelies. From Cyprus he embarked with some pilgrims for the Holy Land, and reached Jerusalem on the 4th of September 1523. He there visited with holy veneration the hallowed spots which religious tradition has consecrated. To accomplish the objects of his journey, he was desirous not only of contributing to the edification of the believers, but also to the conversion of the infidels. His projects however were defeated by the refusal of a permission of residence from the primate of the Church of Rome at Jerusalem. He then re-embarked for Europe, and arrived at Venice in January 1524, and from thence he returned to Barcelona. In this town he determined upon making some stay, in order to acquire by study a greater influence in the conversion of souls. He addressed himself for that purpose to Jerome Ardebala, while a pious lady, Isabella Rosel, undertook to provide him with the necessary means. His early education had been greatly neglected, and the dissipations of a camp had obliterated from his mind the little he had learnt. At the age of thirty-three he began with zealous industry to apply himself to the rudiments of grammar. But his active mind found extreme difficulty in applying itself to its tedious minutiae; and, absorbed in religious contemplation, each word he met with excited a train of pious thoughts. Still by constant application he appears to have made some progress in learning. He continued at Barcelona till the zealous attempts on his part to reform some irregularities which existed in a convent of nuns exposed him to the vengeance of those who had partaken in their disorders. He then retired to the University of Alcalá, which had lately been founded by Cardinal Ximenes, in order to prosecute his studies. A religious address which he delivered to the students was the occasion of his dismissal from that university, and the obligation to study theology during four years, before he could again be permitted to teach in public, was imposed upon him. In 1527 he retired to Salamanca, where, having imprudently resumed his public teaching, he fell under the displeasure of the Inquisition, who punished him by a severe confinement, and dismissed him from their city with a similar injunction.

Discouraged by the rude reception which his pious labours had met with in his native country, he repaired to Paris, at that time the most renowned seat of learning in Europe. He arrived in February 1528. The slender means which had been provided for him by the charitable generosity of his friends were perjured by the dishonesty of a fellow-student, and he was again compelled to have recourse to begging for his subsistence. He however zealously applied himself to the studies of the university: obliged to recommence his rules of grammar and the principles of philosophy before he could be admitted as a theological student, he humbly placed himself in the class of the youngest and least advanced scholars, and besought their teacher to treat him as one of them. His time in Paris appears to have been spent partly in the laborious acquisition of knowledge, and partly in the endeavour to obtain a salutary influence over his companions. In the latter pursuit he was eminently successful. Two students shared his rooms, Peter Faber, or Le Fevre, a native of Savoy, of humble origin and simple manners, and Francis Xavier of Navarre, of noble ancestry and aristocratic demeanour. These young men, of such different dispositions and habits, were the first-fruits of Loyola's labours. From that time the three companions formed the closest intimacy, dividing their gains, and sharing each other's toils. Shortly after three more students, named Lainez, Bobadilla and Rodriguez, acknowledged the influence

of Loyola, and joined his small society. On the 15th of August 1534 they assembled together at the church of Montmartre, in one of whose subterraneous chapels Faber, who was a priest, administered to them the Sacrament of the Eucharist. They then took the solemn vows of chastity, absolute poverty, devotion to the care of Christians, and to the conversion of infidels. They further resolved on proceeding to Jerusalem, but, in case impediments to the accomplishment of this object should be put in their way, they decided upon placing themselves under the guidance of the pope, and implicitly submitting to his directions. Such was the humble origin of the famous Order of the Jesuits, so called because they placed themselves under the banners of Jesus, as soldiers under their chief. The history of the founder now becomes mingled with that of the Order itself, which for distinctness we have placed apart at the end of this article. We here therefore only state the principal events in Loyola's life, which are of a more private character.

After revisiting his native country, where he religiously repaired the effects of some early faults, he proceeded to Venice, in which city he was joined by his companions, and from thence proceeded to Rome. Their intended departure for Palestine was interrupted by the war which broke out, in 1537, between the Venetians and the Turks; they therefore presented the offer of their services to the See of Rome. They were gratefully accepted by the reigning pontiff, who gladly availed himself of the support of a society of men full of zeal and enthusiasm, and bound together by the common tie of implicit obedience to his orders. "Deeply shaken by open schism and lurking disaffection, the Church of Rome found an unexpected source of strength in her own bosom, a green shoot from the yet living trunk of the aged tree." (Hallam.) On the 27th of September 1540, Paul III. published a bull sanctioning, under some limitations, the establishment of the Order; another was finally issued in 1543, which removed these limitations, and made the sanction unconditional. Meanwhile six of the oldest members met together to elect a president subject to no control but that of the See of Rome; their choice fell on Loyola. He remained at Rome as the centre from which he was to control and direct the movements of the society. His time was spent there in revising its rules and constitutions, and in works of charity. He founded an asylum for the protection of Jews who had become proselytes to Christianity, and a penitentiary where the victims of sensual seductions might, without binding themselves by any religious vow, lament their sins and reform their lives. In the year 1546 Francis Borgia, whom the Church of Rome honours as a saint, caused their first college to be founded at Gandia in Spain; the statutes were drawn up by Loyola, and the same privileges were accorded to it which belonged to the universities of Alcalá and Salamanca. Not twenty years had elapsed since from these very universities Loyola, then a poor and despised student, had been contumeliously expelled as a factious and illiterate pretender.

On the 31st of July 1556 this extraordinary man, worn down by infirmities and self-inflicted mortifications, left a world which for so many years he had looked upon only as the scene of charitable labours. It were a useless task to attempt a delineation of Loyola's character; it is best known by his works. Whatever difference of opinion may be entertained respecting the order of the Jesuits, there can be but little respecting their founder.

The memory of Ignatius was consecrated by a ceremony known in the Church of Rome by the name of Beatification in 1609, and he was canonised as a saint by Pope Gregory, XV. in 1622. His festival is celebrated on the 31st of July.

His Life has been written by Gonzales and Ribadeneira, two of his early companions, the latter his confessor; also by Maffeus in Latin, Bartoli and Bouhours in French, and by Mr. Isaac Taylor in English. His 'Spiritual Exercises' were published at Rome in 1548, and have been translated into French by Drouet de Maupertuis and Clément. His 'Maxims' translated were published at Paris in 1633.

The SOCIETAS JESU, or Order of the Jesuits as it is commonly called, was the result of the reflections of Loyola on the best means of reclaiming such of his fellow-creatures as had strayed either from the path of moral purity or the doctrines of his church. Musing on this subject, he conceived the plan of establishing a religious order, which should be entirely devoted to the four following objects: 1. The education of youth. 2. Preaching and otherwise instructing grown-up people. 3. Defending the Catholic faith against heretics and unbelievers. 4. Propagating Christianity among the Heathens and other infidels by means of missionaries. Loyola, led thereto no doubt by his military experience, based the rules of his intended order upon the principle of a strict subordination, carried through several gradations, terminating with the prepositus generalis, or general superior, who was to have absolute sway over the whole society, and from whose decisions there was to be no appeal. The general was to be subject to the pope only. Most of the old monastic orders had a considerable share of democracy in their institutions; they assembled in chapters and elected their local superiors, and decided upon other questions concerning their community by a majority of votes, and although they had also their respective generals residing at Rome, yet their authority over the distant convents of the various provinces was very limited. Their chapters occurred frequently, and their generals

and provincials were mostly changed every three years. All this gave them something of a popular character; they had their canvassing for elections, their personal ambition, and intrigues. But Loyola's projected order was strictly monarchical, and therefore adapted to be a more effective support to the Roman see, at a time when support was most wanted in consequence of the spreading of the Reformation. Besides this, the wealthier of the monastic orders, such as the Benedictines, employed their leisure in scientific and speculative studies, living retired and knowing little of political affairs; and the mendicant orders of friars, had degenerated from their first zeal, and had become obnoxious by the sale of indulgences, and despised for their corruption, ignorance, and vulgarity. The prelates of the court of Rome, such as Bembo and Leo X. himself, spoke with open scorn of the friars, and called them hypocrites. Another advantage of the proposed constitution for the Jesuits was, that they were not bound to keep canonical hours in the choir like other monks, and therefore had more uninterrupted leisure for study or business.

Pope Paul III., after deliberating with his cardinals, some of whom were not favourable to Loyola's plan, approved of it, and it was decided that the new order should be called the Society of Jesus, that the members should wear no monkish garb, but dress in black, like the secular priests, and should in fact differ essentially from the monastic orders then existing. The bull of the pope authorising the new society was issued in 1540, and in it, by a remarkable privilege, the general of the Jesuits was authorised to issue such regulations as he judged fit, and to alter the existing ones according to time, place, and circumstances. The original 'Constitutiones' of Ignatius were written in Spanish, but afterwards translated into Latin. The first edition of them appeared at Rome, 'Constitutiones Societatis Jesu,' 1558, two years after the death of the founder. At his death the society was already established in Italy, Spain, Portugal, and Germany, and had above 100 schools, besides numerous missionaries in the East and in Africa and America. Ignatius was succeeded as general of the society by James Laines, a man of more extensive information and greater elasticity of character than his predecessor. It is to Laines that the principal share in framing the 'Constitutiones' is attributed, and that work bears the impress of a master mind. Cardinal Richelieu said that it was a model of administrative policy. The 'Constitutiones' are divided into ten parts, subdivided into chapters. Part i., 'De admissione ad probationem,' concerns the mode of admission of applicants for the novitiate; the qualifications required in the applicant, such as health, no grievous deformity or mutilation, or other physical imperfection; certificates of good conduct and temper, natural abilities, and fourteen years of age complete. Birth, wealth, and other accidental circumstances are to be considered as null where the physical and mental qualifications fail; but should they be united with these in the same individual, they render him more acceptable. Then comes a list of absolute impediments to admission, such as having committed murder, apostacy, and other grievous offences, having been subjected to a degrading sentence, having belonged to some monastic order, being married, and lastly, labouring under insanity or decided weakness of intellect. Defects of temper, obstinacy, injudicious enthusiasm or visionary devotion, being involved in debt, and other civil ties, are not absolute impediments, but the consideration of them is left to the discretion of the general or of any of his subordinates, to whom he may give the power of admitting probationary pupils. The candidate, if approved of, is admitted to a first probation, as a sort of guest for a few weeks in one of the houses of the society, in order that he may become acquainted with the mode of living. He afterwards assumes the dress of the order, and is examined by proper examiners upon the numerous points contained in the printed form, 'Primum ac Generale Examen in omnibus qui in Societatem Jesu admitti petunt proponendum,' Rome, 1558. Should the examination prove satisfactory, the applicant is shown the constitutions and regulations of the society; and after confessing himself and receiving the sacrament, he signs a declaration that he will observe the rules and discipline thereof, and he is then admitted into one of the houses of second probation, or novitiate. Part ii., 'Quæ ad eos dimittendos pertinet, qui ad probationem admisi fuerunt et parum apti ad Societatem inveniuntur.' Those who during their novitiate are found, after mature experience, not to be fit subjects for the society, on account of mental or bodily defects or vices, are to be dismissed privately, without scandal or exposure, and with kind advice and exhortations. Those who leave of their own accord are not to be sought after, unless they have qualities which make it desirable for the society to retain them. Part iii., 'De iis conservandis et promovendis qui in probatione manent.' This part treats of the mental and moral discipline to which novices are subject; docility and obedience are to be inculcated, pride and obstinacy to be conquered: it treats also of the physical education, cleanliness, wholesome diet, proper exercise, &c. The term of probation lasts generally two years. Part iv., 'De iis qui in Societate retinentur instruendis in literis.' This part treats of the colleges and schools. The colleges have revenues derived from donations or bequests of benevolent persons; those colleges which can support twelve scholars besides teachers are not to collect alms or receive other eleemosynary offerings. After two years' probation, those who intend to enter the society are received as scholastici in one of the colleges, and take the

vows of chastity, poverty, and obedience. The courses are humanities and rhetoric, logic, natural and moral philosophy, metaphysics, and theology (both scholastic, and positive or dogmatic), and the study of the Scriptures. Besides the colleges or seminaries for the society, there are classes and schools for lay or external pupils. Every college is under the direction of a rector, appointed by the general or by the respective provincials, and chosen from the class of coadjutors, and removable at pleasure. The Christian doctrine or Catechism is to be read and explained by the rector. Subsequent regulations were published at various times concerning the mode of instruction in the 'Ratio Studiorum' of Acquaviva, and the 'Methodus Docendi et Discendi a P. Juvencio in usum Magistrorum Societatis Jesu,' which was approved of by the 14th general congregation of the society. Another chapter treats of the universities which belong, or may belong, to the society; of the faculties of arts, philosophy, and theology; of the examinations and degrees, &c. The society did not concern itself with the faculties of law and medicine. Part v., 'De iis quæ ad admittendum in corpus Societatis pertinent,' treats of the admission of scholars into the body of the society, either as professi or coadjutors. The professi must have studied theology for four years, and be past twenty-five years of age. The formula of the profession is given. The vows taken on making profession before the reverend father-general, 'locum dei tenenti,' or any other superior appointed by him, are perpetual chastity, poverty, obedience, and a peculiar care of the education of youth; besides which the professi promise an especial obedience to the sovereign pontiff with respect to any missions which he may send them to. This last promise, or vow, is not made by the coadjutors. Part vi., 'De iis qui admitti et in corpus Societatis cooptati sunt, quod ad ipsorum personas attinet,' gives regulations for the manner of living in the professed houses, which, unlike the colleges, cannot have any property or settled income, but the inmate must live upon the alms given by the faithful. The coadjutors who are not employed in the colleges as rectors or teachers must live in the professed houses of charity, like the professi. The professi and the coadjutors must renounce all claims to hereditary succession, nor can the society succeed to any of their claims. But there were also lay or secular coadjutors, who took the simple vows, yet continued to enjoy their property, and lived in the world at large. Part vii., 'De iis quæ pertinent ad admissos in corpus Societatis, ad proximorum utilitatem, in vineam Domini distribuendos,' treats of the various kinds of missionaries, those sent by order of the pope, and those sent by the general of the society, and gives them directions, &c. Part viii., 'De iis quæ conferunt ad eorum qui dispersi sunt cum suo capite, et inter se, mutuan unionem,' recommends frequent reports and correspondence between the rectors and provincials and the general, and between the missionaries and other detached fathers with their respective provincials or other superior, &c. Every member of the society is to report to his immediate superior any misconduct which he observes in any of his companions. The general receives monthly reports from the provincials, and quarterly ones from the superiors of professed houses, the rectors of colleges, &c. These reports contain notes on the disposition, capacities, and conduct of the individual members, besides news and occurrences which may affect or interest the body of the society or any part of it. The second chapter of this part treats of the general congregations or representative assemblies of the society; and it begins by saying, that owing to the regular and constant intercourse and correspondence kept up between the general and the local superiors, the trouble and confusion attending such general assemblies can be in great measure avoided, and they can only be necessary either for the purpose of electing a new general or for deliberating on some very weighty matter concerning the society, such as the dissolution or transfer of its houses and colleges, &c. In the first case each province deposes its provincial and two more professed members, who are chosen by a provincial congregation, convoked for this special purpose, which provincial congregation consists of all the professi of the province who can conveniently attend, and those coadjutors who are rectors of colleges. In the second case, for purposes of deliberation, the father provincial appoints two of his subordinates, and the general may add some others, making not more than five deputies altogether, for each province. Part ix., 'De iis quæ ad caput Societatis et gubernationem ab eo descendente pertinent,' concerns the qualifications, powers, and duties of the Præpositus Generalis. The general is for life, resides at Rome, is attended by a monitor and five assistants. From his orders there is no appeal: all are obliged to obey him unhesitatingly; he may expel members, or remove them wherever he pleases, inflict punishments, issue regulations, or alter the existing ones. His power is in fact absolute. Part x., 'De modo quo conservari et augeri totum corpus Societatis in suo bono statu possit,' contains advice to all and each of the various classes and members, recommending strict discipline, obedience, zealous teaching and preaching; not to seek after dignities or honours, and even to refuse them unless obliged by the pope; strict morality, moderation in bodily and mental labour, brotherly charity, &c.

Lainez, being sent by the pope as his legate to the Council of Trent, was one of the chief advocates of the papal supremacy, and maintained, among other things, against the opinion of the archbishop of Granada and other Spanish prelates, that the jurisdiction of the bishops and

their authority over any particular diocese is entirely derived from the pope, who is the fountain-head of all ecclesiastical authority, and that he can give it or suspend it, or transfer it when he sees fit. Lainez repaired also to the Conference of Poissy, in 1561, where he had to face Beza, and other Calvinist theologians, but his arguments, mixed with coarse vituperations against his antagonists, according to the polemics of the age, produced little effect. About the same time the society, by the influence of the Cardinal de Lorraine, and after several years' struggle against the University of Paris and the Bishop du Belley, obtained letters patent from Francis II. to open colleges and schools in France. The Jesuits taught gratis, and the university, whose courses of lectures were paid for, were jealous of them, and attacked them repeatedly before the Parliament as an institution contrary to the laws and dangerous to the state. But this being the time of the great religious and civil war in France, the belief, says De Thou, that the Jesuits were born to conquer and destroy Protestantism, made the Parliament and the French prelates wink at their introduction into the kingdom, at least until further deliberation. William Duprat, bishop of Clermont, son of the Chancellor Duprat, gave them a house in Paris which they made into a college, called the College of Clermont, and he bequeathed them also 36,000 écus in his will.

During the war of the League the Jesuits, like the other monastic orders, with the Sorbonne, and the Parliament of Paris, showed themselves opposed to the claims of Henri IV. as being a heretic. Even after the abjuration of that prince a fanatic of low birth, called Barrière, conspired to murder him, but was discovered, and it was found that a Capuchin, a Carmelite monk, a curate, and a Jesuit rector of the college at Paris were cognisant of and accessory to the conspiracy. Soon after another fanatic, Jean Chatel, attempted his life, and actually wounded Henri. This young man had studied under the Jesuits, but it was never proved that they had instigated him to the deed. It is true that among the papers of a Jesuit called Guignard some satirical and abusive expressions against the king were found, which seemed to imply an approbation of the crime. Chatel was broken on the wheel, and Guignard was hanged; and the Parliament of Paris, already instigated against the Jesuits by the university, decreed their banishment in 1594, which sentence however did not extend to the jurisdictions of the parliaments of Bordeaux and Toulouse. But at the end of 1603 Henri IV., at the pressing request of the pope, recalled the Jesuits, and on the 2nd of January 1604 the Parliament of Paris registered the king's letters patent for the restoration of the Jesuits. From that time they remained in France, where they greatly extended the number of their colleges and pupils, though always seen with a jealous eye by many, till their final expulsion in 1764.

The Jesuits found their way into England under Elizabeth, in whose reign several of them were implicated in conspiracies against the queen, for which they were executed. It ought to be noticed however, that De Thou, who is no friend to the society, states that the conspirator Parry, who is said to have been encouraged in his attempt by a Venetian Jesuit, met at Paris the Jesuit Vatz, who earnestly dissuaded him from his purpose, quoting the opinions of other learned men of the society, who declared that no reason, political or religious, could justify an attempt against the life of a sovereign, however heretical. This and other similar instances prove that in so numerous a body as that of the Jesuits' society men of various tempers and opinions must be found, some of whom, through a strange casuistry or fanatical zeal, arrived at totally different conclusions from those of the more sober and more honest part of their community. In the reign of James I. the Jesuit Garnet was tried for having participated in the Gunpowder Plot; and after exhibiting throughout his examination a great aptitude for equivocation, he was condemned and executed.

The missions of the Jesuits form an important part of the history of their society. The first attempts by Xavier were premature. He had more zeal than information, and the accounts of his numerous conversions ought to be received with caution. The arms of the Portuguese effected more conversions by force in India than Xavier's persuasion, who himself confesses that he could not understand nor be understood by the natives, though he could baptize them. In Japan, where he went unprotected by a Portuguese force, he failed; but he served as a pioneer to prepare the way for others better qualified for the task, and the Jesuits formed in time numerous Christian congregations in Japan. The history of the Japanese Christians, and their extermination in 1637, is found in Bartoli, 'Historia della Compagnia di Gesu,' 'Il Giappone, seconda parte dell' Asia;' and it forms a narrative of considerable interest, written apparently with great simplicity. The author does not disguise the faults committed by the Christians, which contributed to their ruin.

In China the Jesuits were likewise successful, and their establishment there has been more durable. Bartoli, in another part of the same work, 'La Cina, terza parte dell' Asia,' gives an account of their settlement in that empire, and of their progress; and further information is found in the 'Lettres Edifiantes et Curieuses.' [HALDE, DU.] Between the years 1581 and 1681, one hundred and twenty-six European Jesuits were employed in the missions of China, many of them men of intelligence, to whom Europe is indebted for the first authentic information respecting the internal condition of that vast empire.

The generals of the society chose men acquainted with mathematical and mechanical sciences, which they knew were in request at Pekin, and thus they obtained a footing and an influence at the emperor's court which no other Europeans have ever acquired. Although persecutions burst out against the Christians of China, yet the Jesuits never entirely lost their hold there, and their house at Pekin has continued to exist till our own times. [AMLOT, JOSEPH.]

From India Jesuit missionaries found their way into Abyssinia, where Portuguese travellers had penetrated many years before [ALVAREZ], but the Jesuits went farther into the country, especially in its southern parts, than any other Europeans, either before or after them. PAEZ and Lobo visited the sources of the Bahr-el-Azrek, or Abyssinian Nile, and Father Fernandez proceeded as far as Narca, about 8° N. lat. [TELIEZ.]

In Paraguay the Jesuits had an open field for the display of their abilities and principles. Their missionaries went to South America after the country had been devastated by the Spanish conquerors, who hunted the Indians like wild beasts. The Jesuits judged that the poor natives might be converted by milder means, and be made Christians and happy at the same time. They obtained from the court of Spain a declaration that all their Indian proselytes should be considered free men, and that the Jesuits should have the government of the communities of converts which they should form in the interior of the country. And the Jesuits did form a flourishing community of Indian converts on the banks of the Paraguay and the Parana, who are said to have amounted to between one and two hundred thousand, and they governed them for a century and a half, keeping them in the condition of docile but contented pupils, directing their labours, and instructing them in the useful arts, but not in the refinements or luxuries of Europe. There were no taxes or lawsuits in Paraguay; each able-bodied man had a moderate task to perform, and the produce of their common labour provided for the wants of all. Writers of very different opinions, Raynal, Montesquieu, Robertson, Muratori, Southey, and others, have done justice to the paternal administration of the Jesuits in Paraguay. In 1750, Spain, by a treaty with Portugal, gave up seven districts of Paraguay to the latter power, in exchange for a territory which the Portuguese had occupied on the left bank of the river La Plata, and the Spanish government ordered the Jesuits and their Indian pupils to abandon their homes and remove to some other part of the Spanish territories. The fathers in vain remonstrated against the injustice and cruelty of expelling men from the fields which they had by their labour reclaimed from the wilderness; the harsh mandate was repeated, and the Jesuits were prepared to obey. But the natives refused to submit, and resisted the Portuguese and Spanish forces which were sent against them, and although a subsequent change in the diplomatic relations of the two countries left the Indians in possession of their country, yet the Jesuits were falsely accused of having encouraged what was styled the rebellion. The Spanish government, after mature investigation, acquitted them, but it was otherwise with the Portuguese. An attempt by some noblemen to murder the king, Joseph of Portugal, was charged upon the Jesuits, because Father Malagrida, one of the society, was the confessor of some of the guilty. As proof however could not be obtained against him, Father Malagrida was accused of heresy, on account of some ascetic visionary works which he had published, was condemned by the Inquisition, and executed; and in September 1759 the minister Pombal, in the king's name, gave an order for the expulsion of the society from the Portuguese territories and for the confiscation of their property.

France followed next in the same course of proscription. The Jesuits had made themselves many enemies in that country by their long and bitter persecution of the Jansenists, and their controversies with that sect had brought much obloquy upon their institutions and moral principles. Pascal, in his 'Lettres Provinciales,' had assailed them with ridicule, which has always proved most powerful in France. The parliament of Paris felt an old and hereditary hostility towards them: the minister Choiseul disliked them on personal and political grounds; he had felt and ascertained that their secret influence could often thwart and balance the credit of any minister; besides which, Choiseul was partial in a certain degree to some of the freethinking philosophers of his time, who had no sympathy for the society. To crown all, even the king's mistress, Madame de Pompadour, arrayed herself against the Jesuits. A pretence soon occurred for effecting their expulsion. Father Lavalette, who was at the head of the missions in the French West Indies, had been speculating in colonial produce. His cargoes were seized by the English, then at war with France. Father Lavalette became a bankrupt for 3,000,000 livres. His creditors in France appealed to the parliament of Paris, which, having seen in the constitutions of the society that no individual belonging to it could possess property on his own account, considered Father Lavalette's debt as that of the whole body, and condemned the society to pay the creditors. An immense outcry was raised against the Jesuits, and the parliament in 1762 declared that an independent body like the society, having peculiar laws, and being all subject to one individual residing at Rome, was an institution dangerous and unfit for any well-regulated state; the other parliaments made similar declarations; and at last, in 1764, by an order of the king, the society was entirely suppressed in France, and their property was confiscated; but a small pension was given to the members, who were

allowed to remain dispersed in the country, on condition of swearing to renounce the society and its institutions.

The fall in Spain took place three years later. Choiseul is said to have contributed to it by persuading Charles III. that an insurrection which broke out at Madrid in 1766 against the minister of the day was the work of the Jesuits. D'Aranda, the president of the council of Castile, already prepossessed against the society, was the confidant of King Charles in effecting their expulsion. The society was feared, perhaps more than there was need, and everything was planned against them with the greatest secrecy. The king with his own hand wrote letters to all the governors of provinces throughout the Spanish monarchy in Europe and in the colonies, which were not to be opened until a specified day and in a specified place. When the appointed time came, the 31st of March 1767, the colleges and houses of the Jesuits throughout Spain were surrounded at midnight by troops, sentinels were posted at every door, the bells were secured, and king's commissioners having roused and assembled the respective communities in the refectory, read to them aloud the royal decree which expelled them from Spain. The members, having taken their breviaries, some linen, and a few other conveniences, were placed in carriages and escorted by cavalry to the coast, where they embarked for Italy. After being refused admittance in several harbours, and kept for some months on board crowded ships, during which many of the aged and infirm died, the survivors were at last landed in Corsica.

Similar measures were executed in Spanish America, only with circumstances of still greater harshness. In Paraguay the Indians were amazed and distracted at the news, and would have opposed by force the execution of the decree, but the fathers exerted all their unbounded influence to appease the enraged Indians, and to induce them to submit quietly to the royal decree. No more than 9000 dollars, about 2000*l.* sterling, were found in their coffers. By a compromise between the pope and the king of Spain, the latter allowed a pension of a shilling a day to the expelled fathers; but on condition that no apology of any sort should be written by any member of the order, under pain of all losing their pensions.

In the following year (1768) the King of the Two Sicilies and the Duke of Parma suppressed the Jesuits' Society in their dominions. It still continued in the Sardinian and the Papal states; but in February 1769 their supporter Clement XIII. died, and Ganganelli was elected in his stead. France, Spain, Portugal, Naples, all insisted, in very strong terms, on the final suppression of the society by the new pope. Ganganelli proceeded with caution; he took three years to consider the matter. He appointed a congregation of five cardinals to examine the charges brought against the society. At last, on the 21st of July 1773, the pope issued a bull, in which, after decanting on the laudable object of the founders of the society, and on the services it had rendered to religion, he observed that on many occasions a spirit of discord had broken out between them and the other ecclesiastical authorities, that many serious charges had been brought forward against individual members, who seem to have deviated from the original spirit of their institutions; that, lastly, most Roman Catholic princes had found it necessary for the peace of their dominions to expel the Jesuits therefrom, and that now, for the peace of the Christian world, and being moved by the most weighty considerations, and considering that the Society of Jesus could no longer bring forth those fruits of piety and edification for which it was intended, he declared the said society to be suppressed and extinct, its statutes annulled, and its members who had been ordained priests to be considered as secular priests, and the rest to be entirely released from their vows. He allowed those professed members who were old and infirm to remain in the houses of the extinct society, but merely as guests, without interfering in their future management, which was entrusted to commissioners.

In consequence of this bull, the Jesuits were likewise suppressed in the Sardinian monarchy, in the Austrian dominions, and in every Catholic state. Two powers only, Prussia and Russia, one Protestant and the other Greek schismatic, allowed the fathers an asylum in their dominions, and continued to entrust them with the education of their Catholic subjects. From Russia they were however expelled by an ukase of the Emperor Alexander in June 1817.

At the time of the first expulsion of the Jesuits from Portugal, in 1759, the society reckoned altogether 22,589 members, half of whom were priests. They had 24 professed houses, 669 colleges, 176 seminaries, or boarding-houses, 61 noviciate houses, 335 residences, and 273 missions. Their principal professed house, in which the general resided, was a vast building attached to the splendid church of the Gesù at Rome. They had besides the Roman college and church of St. Ignatius in the same capital, several other colleges and seminaries for boarders of various nations, a noviciate-house on the Quirinal, a seminary and college at Frascati, a house at Tivoli, and numerous other colleges and schools in the Papal states. All these, after the suppression of the society, were entrusted to secular priests and professors, but still the method and the discipline of the society were in most instances continued, being found too useful to be abrogated.

The general of the society, Father Ricci, was confined in the castle of St. Angelo, being suspected of still assuming in secret his former authority over the dispersed Jesuits, and also, but apparently without

foundation, of having concealed sums belonging to the society. Nothing however having transpired against him, he was treated with some courtesy and attention, but was kept in confinement till his death, in November 1775. On his death-bed, before receiving the sacrament, he signed a solemn though mild protest on behalf of the extinct society, the conduct of which, he said, to the best of his knowledge, had not afforded grounds for its suppression, nor had he himself given any reason for his imprisonment: he ended by forgiving sincerely all those who had contributed to both. His remains were buried with all due honour in the church of the Gesù, among those of his predecessors.

After the society had been suppressed for about thirty years, several attempts were made at the beginning of the present century to re-establish it. Many persons in high stations, frightened at the convulsions which agitated the world, imagined that had the Jesuits continued they might have proved a powerful means for maintaining order and preventing revolutions by the moral influence which they had over youth. In 1801, Pius VII. issued a brief, allowing the Jesuits of Russia to live as a society, and to have colleges and schools. Another brief, dated 30th of July 1804, allowed at the request of king Ferdinand of Naples, the opening of schools and colleges by the Jesuits in the kingdom of the Two Sicilies. Lastly, after his restoration, Pius VII. issued a bull, in August 1814, solemnly re-establishing the society as a religious order, under the constitutions of St. Ignatius, and under obedience to the general chosen by it, to be employed in educating youth in any country of which the sovereign shall have previously recalled or consented to receive them: and Pius began by restoring to them their house of the Gesù, and afterwards the Roman college. They have since found their way back, either by open invitation or implied permission, into almost every Roman Catholic country of Europe; and probably there is no Protestant country in which they are not more or less numerous.

The act of the 10th Geo. IV., c. 7, which is entitled 'An Act for the Relief of his Majesty's Roman Catholic subjects,' forbids Jesuits, or members of other religious orders, communities, or societies of the Church of Rome, bound by monastic or religious vows, from coming into the realm, under pain of being banished from it for life; except natural born subjects, who were out of the realm at the time of the passing of the act. Such religious persons may however enter the United Kingdom on obtaining a licence in writing from one of the principal secretaries of state, who is a Protestant, and may stay such time as such secretary shall permit, not exceeding six months, unless the licence is revoked before the end of the six months. The act also makes it a misdemeanour in any Jesuit, or member of other religious body described in the act, to admit, or to aid in or consent to the admission of, any person within the United Kingdom to be a member of such body; and any person admitted or becoming a Jesuit, or member of other such body within the United Kingdom, shall, upon conviction, be banished from the United Kingdom for life. It is however provided that nothing in this act shall affect any religious order, community, or establishment consisting of females bound by religious or monastic vows.

During two centuries and a quarter which elapsed from their foundation to their suppression, the Jesuits rendered great services to education, literature, and the sciences. Throughout all Roman Catholic states they may be said to have established the first rational system of college education. Other orders, such as the fathers of the Christian Doctrine, instituted in 1571, the Clerici Scholarum Piarum, in 1617, and the Brothers of the Christian Schools, or Ignorantines, in 1679, applied themselves more especially to the elementary education of children, though the Jesuits also did not altogether neglect this branch. The colleges of the Jesuits were equally open to the noble and the plebeian, the wealthy and the poor: all were subject to the same discipline, received the same instruction, partook of the same plain but wholesome diet, might attain the same rewards, and were subject to the same punishments. In the school, the refectory, or the play-garden of a Jesuit's college, no one could have distinguished the son of a duke from the son of a peasant. The manners of the Jesuits were singularly pleasing, urbane, and courteous, far removed from pedantry, moroseness, or affectation. Their pupils, generally speaking, contracted a lasting attachment for their masters. At the time of their suppression the grief of the youths of the various colleges at separating from their teachers was universal and truly affecting. Most of the distinguished men of the 18th century, even those who afterwards turned free-thinkers, and railed at the Jesuits as a society, had received their first education from them; and some of them have had the frankness to acknowledge the merits of their instructors. The sceptical Lalande paid them an honest tribute of esteem and of regret at their fall: even Voltaire spoke in their defence. Gresset addressed to them a most pathetic valedictory poem, 'Les Adieux.' The bishop De Bausset, in his 'Vie de Fénelon,' has inserted a most eloquent account of the Institution of the Jesuits, of their mode of instruction, and of the influence which they had, especially in the towns of France, in preserving social and domestic peace and harmony. For the Jesuits did not exclusively apply themselves to the instruction of youth; grown-up people voluntarily sought their advice concerning their own affairs and pursuits in life, which they always freely bestowed; they encouraged the timid and weak, they directed the disheartened and the forsaken towards new paths for which they saw

that they were qualified; and whenever they perceived abilities, good will, and honesty, they were sure to lend a helping hand. The doors of the cells of the older professed fathers were often tapped at by trembling hands, and admittance was never refused to the unfortunate. In private life at least, whatever may have been the case in courtly politics, their advice was generally disinterested. It has been said that they excelled in the art of taming man, which they effected, not by violence, not by force, but by persuasion, by kindness, and by appealing to the feelings of their pupils. If ever mankind could be happy in a state of mental subordination and tutelage under kind and considerate guardians, the Jesuits were the men to produce this result; but they ultimately failed. The human mind is in its nature aspiring, and cannot be permanently controlled; it cannot be fashioned to one universal measure; and sooner or later it will elude the grasp of any system, whether military or political, ecclesiastical or philosophical, and will seek, at any cost, to gratify its instinctive desire for freedom.

Among the members of their own society the Jesuits have had distinguished men in almost every branch of learning. In the mathematical sciences we may mention, among others, Jacquier, Le Sueur, Boscovich, and Le Maire; in classical literature, Petau, Sirmont, Jouveny, Lagomartino, Tursellini, &c.; in general literature, Possevin, Bettinelli, Tiraboschi; in ecclesiastical learning and sacred oratory, Bellarmino, Pallavicino, Segneri, Bourdaloue; in Oriental philology, Kircher, Ignazio Rossi, Amiot, Gaubil, &c. The 'Fasti Societatis Jesu,' the 'Acta Sanctorum S. J.,' the numerous letters and memoirs of the various missions, may be consulted in order to judge of the value of Jesuit learning and labour.

* LUBBOCK, SIR JOHN WILLIAM, BART., a distinguished mathematician and physical astronomer, the only child of the late Sir J. W. Lubbock, Bart., merchant and banker of London, was born on the 26th of March 1803, and succeeded to the title as third baronet on the demise of his father in 1840. He was educated at Trinity College, Cambridge, where he graduated as M.A. in 1825. He was elected a Fellow of the Royal Society on the 15th of January 1829, and on the 30th of November of the following year was elected a member of the council and treasurer of the society. This officer, being also nominated, together with other members of the council, to the office of vice-president, appears by recent usage—which seems to have commenced with Sir J. W. Lubbock, under the presidency of his late Royal Highness the Duke of Sussex—to act as the senior vice-president, in a more particular manner representing the president in his absence in conducting the affairs of the society. He continued to be annually re-elected the treasurer till the year 1835, and subsequently from 1838 to 1845, thus having retained the office for twelve years, being a longer term than any of his predecessors during the present century. In the first charters, dated in 1837, of the University of London, he is appointed one of the Fellows, and also the first vice-chancellor, an office which he resigned in 1842, retaining as a Fellow his seat in the senate.

Sir John Lubbock is the author of numerous papers, chiefly relating to the principal subjects of science to which, in honourable union with the pursuits of commerce, he has devoted himself, in the 'Memoirs of the Royal Astronomical Society,' and in the 'Philosophical Transactions of the Royal Society.' One of his earliest papers, 'On the Determination of the Orbit of a Comet,' was read before the former body on the 9th of January 1829, and is contained in the fourth volume of the 'Memoirs.' His first paper in the 'Philosophical Transactions' appears in the volume for 1830, under the title 'On the Pendulum,' and relates to the theory of the convertible form of that instrument, originally suggested in 1811 by Professor Bohnenherger of Tübingen, but which was first produced independently by the late Captain Kater. The author in this paper, after noticing what had been done by Laplace and Whewell, attempts to discuss for the first time all the circumstances then known to affect the accuracy of Captain Kater's method, treating the question with the utmost generality, endeavouring to render the theory of the convertible pendulum as perfect as the method of observation. But Sir John Lubbock's more considerable investigations have related to the Planetary and Lunar theory, and to the Tides. His 'Researches in Physical Astronomy,' embracing the former subjects, were first published in the 'Philosophical Transactions,' commencing with a paper in the volume for 1830, in which it is shown that the conditions relative to the disturbing forces under which Laplace had demonstrated that the stability of the planetary system is always eventually preserved, are not necessary to the stability of a system of bodies subject to the law of attraction which governs our system; but that the variations of the elliptic constants are all periodic, and "oscillate therefore within certain limits. This theorem is no longer true if the planet moves in a resisting medium."

The second paper in the same volume consists of two parts—'On the Precession of the Equinoxes,' and 'On the Theory of the Motion of the Planets,' in continuation. In the first part the author extends his former conclusions regarding the stability of the system to the problem of the Precession of the Equinoxes, understanding that stability to mean, in this case, "that the pole of the axis of rotation has always nearly the same geographical latitude, and that the angular velocity of rotation and the obliquity of the ecliptic vary within small limits, and that its variation is periodical."

These researches are pursued in nine other elaborate papers contained in the 'Philosophical Transactions' for 1831, 1832, 1834, and 1835. Nearly the whole investigation was subsequently published as a separate work, under the title, 'On the Theory of the Moon and on the Perturbations of the Planets,' which first appeared in 1833; a new edition, occasioned by some researches of Plana, being published in parts in the three following years. An account of the 'Traité sur le Flux et Réflux de la Mer' of Daniel Bernoulli, in a separate tract (London, 1830), preceded the publication of Sir J. W. Lubbock's investigations on the Tides, principally as they occur in the ports of London and Liverpool, which were communicated to the Royal Society from 1831 to 1837, in nine papers; the Bakerian Lecture for 1836 being one of those 'On the Tides at the Port of London.' The Royal Medal on Physics for 1834 had been awarded to him by the Council of the Royal Society, for his "highly valuable investigations on the tides," which down to that period had been published in the 'Transactions.'

In the 'Phil. Trans.' for 1831 and 1841 are two papers on the subject of meteorology, which conclude the list of the author's contributions to the Royal Society. On that science, as well as on the tides, he also contributed some papers to the 'Companion to the British Almanac;' and this leads us to notice that he was an original member of the Committee of the Society for the Diffusion of Useful Knowledge, and edited the 'Maps of the Stars,' which formed part of the publications issued under its superintendence. In conformity with the practice of other mathematicians and physical astronomers of all periods, in addition to papers contributed to academical collections, he has made public some of his results and views in separate tracts. Among the subjects of these are 'Cask-gaging,' the 'Computation of Eclipses and Occultations,' the 'Classification of the Different Branches of Human Knowledge' (of which two editions have appeared), an 'Elementary Treatise on the Tides,' 1839, and an elaborate investigation 'On the Heat of Vapours and on Astronomical Refractions,' bearing on many important objects of meteorological and chemical research, as well as on astronomy. Some of these tracts, or their substance, are inserted also in the 'Philosophical Magazine.'

The improvement of mathematical notation appears to have been an object held in view by Sir John Lubbock, from an early period in his mathematical researches. In 1829 he communicated a paper 'On Notation' to the Astronomical Society, which was inserted in the 'Memoirs,' vol. ix., p. 471. After remarking that that part of the theory of mathematical notation which relates to symbols of quantity had hitherto been entirely disregarded, and briefly adverting to that theory as regards language, he proceeds to submit his own rules of notation, and a table exhibiting synoptically that employed by some of the most distinguished astronomers for a few of the quantities which occur frequently. The subject is returned to repeatedly in his subsequent works, in one of which (the preface to the account of 'Bernoulli on the Tides' already noticed) he observes, "It is, I think, a matter of great regret, that the notation adopted by different mathematicians should be so various. I have therefore thought it desirable to give frequent comparisons of the symbols I have adopted with those to be found elsewhere; and I have endeavoured as far as possible not to use the same letter for different quantities, and not to represent the same quantity by different letters." A notice of one of those subjects of profound interest which unite the objects of the astronomer with those of the geologist, suggested by our author, must conclude this article. His first paper on the 'Precession of the Equinoxes,' 1838, as already alluded to, proceeded upon the hypothesis that the earth revolves in a medium devoid of resistance. In the 'Phil. Trans.' of the following year he investigates the subject on the supposition that the earth revolves in a resisting medium, the effect of the resistance of which "is to increase the latitude of the axis of rotation (reckoned from the equator of the figure), till it reaches 90°." Such is now the condition of the axis of the earth; but as the chances are infinitely great against this having been its original position, may not its attainment in this position be ascribed to the resistance of a medium of small density acting for a great length of time,—a supposition which may account for many geological indications of changes having taken place in the climates of the earth? This suggestion of a possible cause of many geological phenomena, certainly of the nature of a 'vera causa,' appears, most unaccountably—except indeed that it had been offered in researches on physical astronomy—to have been left unnoticed by geologists, until the author himself revived it, eighteen years after its first enunciation, in a letter to Sir C. Lyell, read before the Geological Society in 1848, and published in its 'Quarterly Journal,' vol. v., p. 4. In this letter the subject is pursued, explicitly, into several of its geological consequences; and Sir J. Lubbock's views were discussed in some detail, by the then president, Sir H. T. De La Beche, in his anniversary address of 1849, inserted in the same volume of the 'Journal,' pp. lxxxv.—lxxxix.

LUBIENIETSKI (Latinised LUBIENIECIUS). There are five persons of this name (one Andrew, two Christopher, and two Stanislas), all distinguished in the Polish Socinian controversy. A list of their several writings may be found in Sandius, 'Bibl. Antitrin.,' Freistadt, 1684. The subject of the present article is Stanislas the younger, son of Christopher, who was born at Cracow, August 23, 1623. He was minister of a church at Lublin, until driven out by the arm of power

for his opinions. He died in exile at Hamburg, May 18, 1675. His death is stated to have been caused by poison—a fact borne out by the death of his two daughters, and the serious illness of his wife, after eating of the same dish; but the Hamburg magistracy neglected to institute the investigation usual in cases of sudden death.

The theological works of Lubienieteki are numerous, and may be found in Sandius, with the exception of the 'Historia Reformationis Polonicae,' published in 1685 at Freistadt, with a life prefixed; but the work which makes his reputation more European, and entitles him to a place here, is his 'Theatrum Cometicum.' This work was published at Amsterdam in 1667 (Sandius and Weidler), but a copy in our possession has a Leyden title-page, and the date 1681. This change of titles in different parts of the same edition was formerly not uncommon, and has caused much confusion. A pictorial frontispiece has the following anagram for Stanislas Lubieniecicus, 'Satis in ulna Jesu lucobis.' The 'Theatrum Cometicum' consists of three parts. The first contains the correspondence of the author with men of science throughout Europe on the subject of the comets of 1664 and 1665, and has in it communications from Vossius, Oldenburg, Hevelius, Kircher, Bouillaud, Von Guericke, &c. &c. The second part contains an elaborate account of all the comets (415 in number) recorded in history down to the year 1665. It is written in support of the hypothesis that comets portend both good and evil, in opposition to the prevailing notion that they were harbingers of misfortune only; and this opinion he supports from history, it being clearly shown that public events of both characters usually followed close upon comets. Thus he points out that though the comet of 323 strengthened the heresy of Arius, it also brought about the council of Nice; and this, from Lubienieteki, was not a little satirical. We are in doubt whether to conclude that the author maintained his hypothesis in good faith, or to suspect that he chose his line of argument as the best practical mode of attacking the prevailing terrors; and our doubt becomes stronger when we see that in the third part, called 'Theatri Cometicæ exitus,' he rather widens his hypothesis; and whereas he had before maintained that comets foretell both good and evil, he now asserts the dilemma that they predict *both or neither*, but still cautiously.

In the discussions about Halley's comet this work of Lubienieteki was freely cited in proof of one and another former appearance, or presumed appearance, of that memorable body. It seems to have been taken for granted that the mere mention of a comet by this author is sufficient evidence of its having really appeared. It may be useful therefore to recommend those who would prove a comet from the 'Theatrum Cometicum' (and the same caution may be given with respect to Riccioli's list), first to examine the authority on which the fact rests. Lubienieteki has collected every instance, and gives his originals; but this, though done with care and great learning (exhibiting a mass of research which will appear wonderful when we remember that the investigator was driven from country to country, and engaged in continual theological controversy), should only serve to enable the reader to discriminate. Many of the authorities cited are worthless, and it even happens that the original historian of one of Lubienieteki's comets was born many hundred years after the phenomenon for the appearance of which he is made sufficient evidence.

LUCANUS, MARCUS ANNÆUS, was born at Corduba (Cordova), in the province of Bætica, in Spain, A.D. 38. He was the son of M. Annæus Mela, who was the brother of the philosopher Seneca, and was carefully educated at Rome under the most eminent philosophers and rhetoricians of the time. His poetry recommended him to the notice of Nero, who treated him with distinguished honour, and bestowed upon him the dignity of *questor* and *augur*. Lucan did not however remain long in the imperial favour. Nero was ambitious of being considered the best poet of his age; and Lucan was foolish enough to enter into competition with his imperial master, and to receive the prize for the best poem in a literary contest with the emperor. Lucan was accordingly forbidden to publish any more poems; and simply, as it appears, on account of this prohibition, he entered into a conspiracy with Piso and many others to assassinate Nero. (Tac., 'Ann.,' xv. 49.) This conspiracy was detected, and Lucan by a promise of pardon was induced to betray his associates. When he had done so however he was condemned to death, and he then opened his veins, and died repeating some of his own verses, which described the death of a wounded soldier in consequence of loss of blood. (Tac., 'Ann.,' xv. 70.) He died A.D. 65, in the twenty-seventh year of his age.

Lucan wrote many poems, which have not come down to us, which were entitled respectively—'Catacausmos Iliacus,' 'Catalogus Heroidum,' 'Hectoris Lyra,' 'Orpheus,' 'Saturnalia,' 'Silvarum libri x.,' 'Medea' (an unfinished tragedy), 'Satiricus Fabulæ xiv.,' &c. The only work extant is a poem on the civil war between Cæsar and Pompey, entitled 'Pharsalia,' which gives an account of the war from its commencement to Cæsar's visit to Cleopatra in Egypt. The poem is comprised in ten books at present, but since the tenth book leaves off abruptly in the midst of a narrative, it is probable that some part has been lost, or that the poet had not finished the work at the time of his death. The first book opens with the most extravagant adulation of Nero, in which the poet even exceeds the base subserviency of the poets of the age of Augustus. The 'Pharsalia' contains many vigorous and animated descriptions, and the speeches are characterised by con-

siderable rhetorical merits, but the language is often inflated, and the expressions extremely laboured and artificial; the poem is also deficient in that truth to nature, and in those appeals to the feelings and the imagination, which excite the sympathy of every class of readers. Still great allowance must be made for the youth of the author, who, if he had lived longer, would probably have cured himself of those faults and defects which are now so conspicuous in his poem.

The best editions of Lucan are by Burmann (1740), Bentley (1760), Weber (1831), and Weise (1835). Among the numerous translations of the 'Pharsalia,' those most deserving of notice are—in French, by Marmontel (1766) and Brébeuf (1795); in English, by Rowe (1718), by May (1627), who also published in 1630 a continuation of the poem to the death of Julius Cæsar, which he afterwards translated into Latin verse (1640), and by H. T. Riley in 'Bohn's Classical Library;' and in Italian, by Cristoforo Bocella (1804).

LUCAS, FREDERICK, was the second son of Samuel H. Lucas, Esq., of Croham, near Croydon, Surrey, a member of the Society of Friends. He was born in 1812, and was educated at the London University, where he gained early distinction as a debater. He was called to the bar in 1838, and in the following year became a member of the Roman Catholic Church. In his new position he took an active part in public matters, and became the founder of the 'Tablet' newspaper, which he conducted as editor for many years. He was also a frequent contributor to the 'Dublin Review.' In 1849 he transferred the 'Tablet' from London to Dublin, and in 1852 was elected M.P. for Meath, mainly through the influence of the Roman Catholic priesthood, whose cause, and that of the poorer classes of the land of his adoption, he warmly espoused. Believing that the Roman Catholic priesthood, under the existing circumstances of the country, were the natural friends and guides of the lower orders, he very warmly and zealously advocated their right to take part in political affairs. In this view he was not supported by the Roman Catholic episcopate in Ireland; and towards the close of 1854 he travelled to Rome, in order to appeal to the pope against the decision of that body. His health, which had long been failing from over exertion of his mental and physical energies, broke down while the matter was under deliberation at Rome, and Mr. Lucas returned to England and died before a formal decision was given. His death occurred on the 22nd of October 1855. He was a powerful but declamatory writer and speaker; but he succeeded from the first in securing the respect and attention of the House of Commons, and his able and fearless advocacy of Tenant Right, and of the independence of the Roman Catholic Church in Ireland, made his loss much regretted by his party.

LUCAS, PAUL, born at Rouen in 1664, first travelled in the Levant as a jeweller, after which he entered the Venetian service against the Turks. In 1696 he returned to France, bringing with him a collection of ancient coins, engraved stones, and other curiosities, which were purchased for the king's cabinet of medals. In 1699 he went to Egypt, and ascended the Nile as far as the cataracts. He afterwards visited Cyprus, Syria, Armenia, and Persia, but was at last plundered at Baghdad of most of the objects of curiosity which he had collected in his journey. He returned to Paris in 1703, and published the narrative of his journey, 'Voyage au Levant,' 1704, which contains numerous exaggerations and absurd stories. Lucas was not deficient in observation, but he did not always tell the truth; perhaps he thought that a dash of the marvellous would enhance his narrative, or perhaps he listened credulously to the stories of others. In 1705 he was sent by Louis XIV. to the Levant again, for the purpose of making collections; and he visited Asia Minor, Macedonia, Syria, and Barbary, and returned to France in 1708. He published the narrative of this second journey in 1710—'Voyage dans la Grèce, l'Asie Mineure, la Macédoine, et l'Afrique.' This work contains some interesting memoirs by other travellers concerning Cyrenaica and Tunis. Louis XIV. sent him out again in 1714, when he visited most of the same countries which he had seen in the preceding journey, for the purpose of correcting his former observations. He returned to Paris in 1717, and in 1719 published an account of his third journey ('Voyage dans la Turquie, l'Asie, Syrie, Palestine, Egypte, &c.'), which is the best of the three, though it also contains some strange stories. Lucas travelled once more in the Levant, and at last died in Spain in 1737, having gone thither for the purpose of examining the antiquities of that country.

LUCETTO DA GENOVA. [CAMBIASO, LUCA.]

LUCIAN (Λουκιανός), a celebrated Greek writer, was born at Samosata, a city on the west bank of the Euphrates, in the Syrian province of Commagene. We possess no particulars respecting his life on which any reliance can be placed, except a few scattered notices in his own writings. From these it appears that he was born about the latter end of Trajan's reign, that he lived under both the Antonines, and died in the reign of Aurelius Commodus, or shortly afterwards. His parents, who were in humble circumstances, placed him with his maternal uncle, a sculptor, in order to learn statuary; but he soon quitted this trade, and applied himself to the study of the law. He afterwards practised at the bar in Syria and Greece; but not meeting with much success in this profession, he resolved to settle in Gaul as a teacher of rhetoric, where he soon obtained great celebrity and a numerous school. He appears to have remained in Gaul till he was about forty, when he gave up the profession of rhetoric, after having

acquired considerable wealth. The greater part, if not all of his dialogues appear to have been written after this time; but most of his other pieces, such as his 'Hercules,' 'Hesiod,' 'Herodotus,' 'Zeuxis,' 'Bacchus,' the 'Dipsades,' &c., were probably written during the time that he taught rhetoric in Gaul. During the remainder of his life we find him travelling about from place to place, and visiting successively Macedonia, Cappadocia, Paphlagonia, and Bithynia. The greater part of his time however was passed in Athens, where he lived on terms of the greatest intimacy with Demonax, a philosopher of great celebrity, and where most of his works were probably written. Towards the latter part of his life he held a lucrative public office in Egypt, which was bestowed upon him by the Emperor Commodus. The account of his being torn to death by dogs for having attacked the Christian religion rests on no credible authority, and was probably invented by Suidas, who appears to have been the earliest to relate it.

The dialogues of Lucian are written in remarkably pure and elegant Greek, and are free from the false ornaments and artificial rhetoric which characterise most of the writings of his contemporaries. Modern critics have usually given him his full meed of praise for these excellences, and have also deservedly admired the keenness of his wit, his great talent as a writer, and the inimitable ease and flow of his dialogue; but they have seldom done him the justice he deserves. They have either represented him as merely a witty and amusing writer, but without any further merit; or else they have attacked him as an immoral and infidel author, whose only object was to corrupt the minds of his readers, and to throw ridicule upon all religion. But these opinions appear to us to have arisen from a mistaken and one-sided view of the character of Lucian. He seems to us to have endeavoured to expose all kinds of delusion, fanaticism, and imposture; the quackery and imposition of the priests, the folly and absurdity of the superstitious, and especially the solemn nonsense, the prating insolence, and the immoral lives of the philosophical charlatans of his age. (See his 'Alexander.') Lucian may, in fact be regarded as the Aristophanes of his age, and, like the great comic poet, he had recourse to raillery and satire to accomplish the great objects he had in view. His study was human character in all its varieties, and the age in which he lived furnished ample materials for his observation. Many of his pictures, though drawn from the circumstances of his own times, are true for every age and country. As an instance of this we mention the essay entitled 'On those who serve the Great for Hire.' If he sometimes discloses the follies and vices of mankind too freely, and occasionally uses expressions which are revolting to our ideas of morality, it should be recollected that every author ought to be judged of by the age in which he lived, and not by a standard of religion and morality which was unknown to the writer. The character of Lucian's mind was decidedly practical; he was not disposed to believe anything without sufficient evidence of its truth; and nothing that was ridiculous or absurd escaped his raillery and sarcasm. The tales of the poets respecting the attributes and exploits of the gods, which were still firmly believed by the common people of his age, were especially the objects of his satire and ridicule in his dialogues between the gods and in many other of his works. That he should have attacked the Christians in common with the false systems of the pagan religion will not appear surprising to any one who considers that Lucian probably never took the trouble to inquire into the doctrines of a religion which was almost universally despised in his time by the higher orders of society. Lucian's statements have sometimes had an historical value assigned to them which he does not appear to have intended: the story of Herodotus reading his history at the Olympic games is one of these. [HERODOTUS.] Lucian had a taste for art, which he has shown by his descriptions in his 'Action,' 'Zeuxis,' 'Eikones,' &c.

The best editions of Lucian's works are by Hemsterhusius, who only edited part of the first volume, and Reiz, 4 vols. 8vo; by Lehmann, 9 vols. 8vo, Leip.; the edition published by the Bipont Society; and an edition without notes by Dindorf, Paris, 1840. The best translation of Lucian into German is by Wieland, 6 vols. 8vo; in French, by De Ballu; and in Italian by Manzoni. There are English translations by Blount, by Franklin, and by Tooke, 2 vols. 4to, Lond., 1820.

LUCIAN, SAINT, Presbyter of Antioch, is said by some writers, but without sufficient authority, to have been born at Samosata; he suffered martyrdom during the reign of Diocletian, A.D. 312, and was buried at Helenopolis in Bithynia. He is frequently mentioned by ecclesiastical writers as a man of great learning and piety. Eusebius calls him a "person of unblemished character throughout his whole life" ('Hist. Eccl.' viii. 13); and Chrysostom, on the anniversary of Lucian's martyrdom, pronounced a panegyric upon him which is still extant. Jerome informs us, in his 'Catalogue of Ecclesiastical Writers' (c. 77), that "Lucian was so laborious in the study of the Scriptures, that in his own time some copies of the Scriptures were known by the name of Lucian;" and we learn from another part of his works ('Præf. in Paralip.' vol. i., p. 1023), that Lucian's revision of the Septuagint version of the Old Testament was generally used by the churches from Constantinople to Antioch. Lucian also made a revision of the New Testament, which Jerome considered inferior to his edition of the Septuagint.

There were extant in Jerome's time some treatises of Lucian con-

cerning faith, and also some short epistles; but none of these have come down to us, with the exception of a few fragments.

There has been considerable dispute among critics respecting Lucian's belief in the Trinity. From the manner in which he is spoken of by most of the Trinitarian Fathers, and from no censure being passed upon his orthodoxy by Jerome and Athanasius, it has been maintained that he must have been a believer in the Catholic doctrine of the Trinity; but on the other hand Epiphanius, in his 'Anchoret' (xxxv., vol. ii., p. 40, D), speaks of the Lucianists and Arians as one sect; and Philostorgius (who lived about 425, and wrote an account of the Arian controversy, of which considerable extracts are preserved by Photius) expressly says that Eusebius of Nicomedia and many of the principal Arians of the 4th century were disciples of Lucian. It is probable that Lucian's opinions were not quite orthodox, since he is said by Alexander (in Theodoret, 'Hist. Eccl.', i., c. 4, p. 15, B) to have been excluded from the Catholic Church by three bishops in succession, for advocating the doctrines of Paul of Samosata. It is however usually supposed that he returned to the Catholic communion before his death.

LUCIFER, bishop of Cagliari in Sardinia, is principally known in ecclesiastical history for refusing to hold any communion with the clergy who had, during the reign of Constantius, conformed to the Arian doctrines, although it had been determined in a synod at Alexandria in 352 to receive again into the church all the Arian clergy who openly acknowledged their errors. In consequence of the decision of the synod at Alexandria, Lucifer eventually left the Catholic church, and his followers are spoken of by ecclesiastical writers as a distinct sect under the name of Luciferians. The number of this sect was always inconsiderable: Theodoret says that it was extinct in his time. ('Hist. Eccl.', iii., c. 5, p. 128, D.) Their opinions however excited considerable attention at the time when they were first promulgated, and were advocated by several eminent men; among others by Faustinus, Marcellinus, and Hilarinus. Jerome wrote a work in refutation of their doctrines, which is still extant.

Augustine remarks, in his work on Heresies (c. lxxxi.), that the Luciferians held erroneous opinions concerning the human soul, which they considered to be of a carnal nature, and to be transfused from parents to children.

Lucifer is acknowledged by Jerome and Athanasius to have been well acquainted with the Scriptures, and to have been exemplary in private life; but he appears to have been a man of violent temper and great bigotry. Being banished from Sardinia by Constantius in consequence of his opposition to the Arian doctrines, he resided for many years in Syria; but after the death of this emperor he returned to his diocese, where he died about 370.

The writings of Lucifer were published by Tillet, Paris, 1568: they consist of—'Two Books addressed to the Emperor Constantius in defence of Athanasius;' 'On Apostate Kings;' 'On the Duty of having no Communion with Heretics;' 'On the Duty of dying for the Son of God;' 'On the Duty of showing no Mercy to those who sin against God;' and a short Epistle to Florentinus.

LUCILIUS, CAIUS, was born at Suesia Aurunca (Sessa), a town in the north-western part of Campania, B.C. 148. He belonged to the equestrian order, and by the female side was grand-uncle to Pompey the Great. In his sixteenth year Lucilius served, together with Marius and Jugurtha, under Scipio Africanus at the siege of Numantia. (Velleius, ii. 9, 4.) He is said to have died B.C. 103 in his forty-sixth year; but the expression of Horace ('Sat.' ii. 1, 34), in which Lucilius is called 'old' (senex), seems to imply, as Mr. Clinton has remarked ('Fast. Hell.', vol. iii. p. 135), that he lived to a later date; though to this it has been plausibly answered that the term 'old' may have reference to the remote period at which he wrote.

Lucilius is expressly said by Horace ('Sat.' i. 1, 61) to have been the first writer of Roman satire; by which we must not understand that no Roman writer had composed any satirical compositions before him, since the satires of Ennius and others are frequently mentioned by ancient authors; but that Lucilius was the first who constructed it on those principles of art which were considered in the time of Horace as essential requisites in a satirical poem. The satires of Lucilius were very popular even in the Augustan age; and to his writings some of the most eminent satirists of antiquity—Horace, Juvenal, and Persius—appear to have been indebted in no small degree for many of their most striking thoughts and expressions.

In addition to his satires, which were divided into thirty books, Lucilius also wrote a comedy entitled 'Numularius,' epodes, and hymns, none of which are extant with the exception of a few fragments from his satires, which were collected and published by R. and H. Stephens in their 'Fragmenta Poetarum Veterum Latinorum,' Paris, 1564, and again, separately, by Douza, Leyden, 1597; they are also included in Mattaire's 'Corpus Poet. Lat.,' London, 1713. Scanty as these fragments are, they enable us to form some idea of the style of Lucilius, which appears to have been distinguished by great energy and power of expression, but to have been deficient in elegance and clearness. Horace compares his poetry to a muddy stream, and complains that his versification was rugged and uncouth ('Sat.' i. 4, 8-11); but Quintilian ('Inst. Or.', x. 1) on the other hand maintains that Horace has not given a fair estimate of the poetry of Lucilius, and that his satires were distinguished by great learning and abundance of

wit. Pliny ('Præf. Hist. Nat.'). Cicero ('De Orat.', i. 16; ii. 6), and Gellius ('N. A.', xviii. 5), also speak in high terms of the style of Lucilius. Juvenal (l. 20) calls him 'Magnus Auruncæ alumnus.'

Lucilius attacked vice with such severity that Juvenal (i. 165) speaks of the guilty as trembling at the vehemence of his rebukes. He did not however confine his satires to the vices of mankind in general, but also attacked private individuals, like the writers of the old comedy among the Greeks, and among other persons, contemporary and preceding poets, as Ennius, Cæcilius, Pacuvius, Accius, &c. (Gell., 'N. A.', xvii. 21.) The powerful protection of Scipio and Lælius, with whom he was on the most intimate terms of friendship (Hor., 'Sat.' ii. 1, 70-75), enabled him also to attack with impunity some of the most eminent political characters in Rome; among whom we find the names of Quintus Opimius, conqueror of Liguria, Cæcilius Metellus, and Cornelius Rufus, who was at that time Princeps Senatus.

LUCIUS I. succeeded Cornelius in 252 as Bishop of Rome. Little is known of him; he survived his election only a few months; some say he was banished, others that he died a martyr. He was succeeded by Stephen I.

LUCIUS II. succeeded Celestinus II. in 1144, and being wounded by a stone thrown at him in an affray of the people of Rome, died shortly after, and was succeeded by Eugenius III.

LUCIUS III., CARDINAL UBALDO, a native of Lucca, was elected by the cardinals after the death of Alexander III. in 1181, and was consecrated at Velletri, the people of Rome being opposed to him. He died in 1185, shortly after having an interview with the Emperor Frederic Barbarossa at Verona. He was succeeded by Urban III.

LUCRETIA. [BRUTUS, M. J.]

LUCRETIVS, with his full name TITUS LUCRETIVS CARUS, was born B.C. 95, and died B.C. 52, in the forty-fourth year of his age. We possess no particulars respecting his life, but he appears to have been born at Rome, was probably of equestrian rank, and is said to have put an end to his own life.

The poem of Lucretius, entitled 'De Rerum Natura' ('On the Nature of Things'), is in six books, and contains a development of the physical and ethical doctrines of Epicurus. Notwithstanding the nature of the subject, which gave the poet little opportunity for those descriptions of the passions and the feelings which generally form the chief charm in poetry, Lucretius has succeeded in imparting to his didactic and philosophical work much of the real spirit of poetry; and if he had chosen a subject which would have afforded him greater scope for the exercise of his powers, he might have been ranked among the first of poets. Even in the work which has come down to us we find many passages which are not equalled by the best lines of any Latin poet, and which, for vigour of conception and splendour of diction, will bear a comparison with the best efforts of the poets of any age and country. In no writer does the Latin language display its majesty and stately grandeur so effectively as in Lucretius. There is a power and an energy in his descriptions which we rarely meet with in the Latin poets; and no one who has read his invocation to Venus at the beginning of the poem, or his beautiful picture of the busy pursuits of men at the commencement of the second book, or the progress of the arts and sciences in the fifth, or his description of the plague which devastated Athens during the Peloponnesian war at the close of the sixth, can refuse to allow Lucretius a high rank among the poets of antiquity.

The object of Lucretius was to inculcate the great doctrine of Epicurus, so frequently misunderstood and misrepresented, that it is the great object of man's life to increase to the utmost his pleasures, and to diminish to the utmost his pains; and since the happiness of mankind was chiefly prevented in his opinion by two things, superstition or a slavish fear of the gods and a dread of death, he endeavours to show that the gods take no interest in and exercise no control over the affairs of mankind, and that the soul is material and perishes with the body. In the first three books he develops the Epicurean tenets respecting the formation of all things from atoms which existed from all eternity, and also maintains the materiality of the soul, which he supposes to be compounded of different kinds of air inhaled from the atmosphere; in the fourth book he inquires into the origin of sense and perception, and the nature and origin of dreams, which leads to a long digression on the folly and miseries of unlawful love; in the fifth he gives an account of the origin and laws of the world, and describes the gradual progress of mankind from a state of nature to civilisation, as well as the origin and progress of the arts and sciences; and in the sixth he attempts to account for a number of extraordinary phenomena, such as waterspouts, hurricanes, earthquakes, volcanoes, and pestilential diseases.

The poetry of Lucretius does not appear to have been highly estimated by the majority of his countrymen. Ovid certainly speaks of it in the highest terms ('Amor.', xv. 23); but Quintilian mentions him rather slightly ('Just. Orat.', x. 1); and Cicero does not praise him without considerable reservation ('Epist. ad Quint.', ii. 11). The nature of his subject, and the little taste which the Romans in general manifested for speculations like those of Lucretius, may perhaps account for his poetry being estimated below its real merits.

The best editions of Lucretius are—by Lambinus, whose commentary is very useful, 1563-70; Havercamp, 1725; Wakefield, 1796-97; Eichstädt, 1801; and Forbiger, 1828. The 'De Rerum Natura' has been translated into most European languages: the translations most worthy

of notice are—the English by Creech (frequently printed), by Mason Good, with the Latin text and numerous notes of little value, in 2 vols. 4to, 1805 (the metrical version forms a volume of 'Bohn's Classical Library'), and by Thomas Busby, 2 vols. 4to, 1813; the French by Lagrange, with the Latin text, 1799, and much better by De Porgenville, 1823; the German by Meinecke, 1795, and by Knebel, 1821 and 1831; and the Italian by Marchetti, 1717, frequently reprinted.

LUCULLUS, LUCIUS LICINIUS, descended from a distinguished Roman family, was born about B.C. 115, and served under Sulla in the Marsian war. Sulla had a very high opinion of the talents and integrity of Lucullus, and employed him, though he was very young, in many important enterprises. Whilst Sulla was besieging Athens (B.C. 87), Lucullus was sent into Egypt and Africa to collect a fleet; and after the conclusion of the war with Mithridates, he was left in Asia to collect the money which Sulla had imposed upon the conquered states. So great was the regard that Sulla had for Lucullus, that he dedicated his Commentaries to him, and in his last will made him guardian to his son.

In B.C. 74, Lucullus was elected consul, and was appointed to the command in the war against Mithridates. During the following eight years he was entirely engaged in conducting this war; and in a series of brilliant campaigns completely defeated Mithridates and his powerful son-in-law Tigranes. In B.C. 73 he defeated Mithridates at Cysicus on the Propontis, and in the following year again conquered him at Cabiri, on the borders of Pontus and Armenia. In B.C. 69 he marched into Armenia against Tigranes, who had espoused the cause of his father-in-law; and completely defeated his forces near Tigranocerta in Armenia. He followed up his victory by the capture of Tigranocerta, and in the following year also took Nisibis, in the north part of Mesopotamia; but was not able to derive all the advantages he might have done from his victories, in consequence of the mutinous disposition of his soldiers. Lucullus never appears to have been a favourite with his troops; and their disaffection was increased by the acts of Clodius, whose sister Lucullus had married. The popular party at home were not slow in attacking a general who had been the personal friend of Sulla, and who was known to be a powerful supporter of the patrician party. They accused him of protracting the war on account of the facilities it afforded him of acquiring wealth; and eventually carried a measure by which he was removed from the command, and succeeded by Pompey, B.C. 66.

The senate, says Plutarch, had looked forward to Lucullus as likely to prove a most powerful supporter of the patrician order; but in this they were disappointed; for Lucullus on his return to Rome took no part in public affairs, and passed the remainder of his life in retirement. The immense fortune which he had amassed during his command in Asia he employed in the erection of most magnificent villas near Naples and Tusculum; and he lived in a style of magnificence and luxury which appears to have astonished even the most wealthy of his contemporaries. Lucullus was a man of refined taste and liberal education; he wrote in his youth the history of the Marsian war in Greek (Plutarch, 'Luc.' c. i.; compare Cic. 'Ad. Att.' i. 12), and was a warm supporter of learning and the arts. His houses were decorated with the most costly paintings and statues, and his library, which he had collected at an immense expense, was open to all learned men. He lived on intimate terms with Cicero, who has highly praised his learning, and inscribed one of his books with the name of his friend, namely, the fourth book of his 'Academical Questions,' in which he makes Lucullus defend the philosophical opinions of the Old Academy.

It is said that during the latter years of his life Lucullus lost his senses, and that his brother had the care of his estate.

LUDLOW, EDMUND, was born at Maiden-Bradley in Wiltshire, about 1620. His father, Sir Henry Ludlow, a considerable landed proprietor in that county, and its representative in the Long Parliament, was an advocate of the democratic cause, which was likewise eagerly espoused by his son. Edmund Ludlow volunteered in Essex's army, and first engaged the king's forces at the battle of Edge-hill (1642): from this time, with only occasional interruptions, he filled such stations, military or civil, as rendered him an important partisan. He denounced the misgovernment of the king, and sought the destruction of the monarchy and the establishment of a commonwealth. He was one of the most active assistants in Colonel Pride's purge, one of the foremost of the king's judges, and one of the most eager voters for the annihilation of the House of Peers. His independence rendered him obnoxious to Cromwell, who, to impair his influence, sent him to Ireland with a military command (1650): a politic expedient, since when Cromwell assumed the authority of Protector, Ludlow loudly protested against his elevation, and if he had been in England might possibly have impeded it. Consistent in his advocacy of an equal commonwealth, he refused, when he left Ireland, to yield Cromwell an unqualified submission. He was regarded with jealousy on account of this refusal, and security was required that he should not act in hostility to the government. His brother, Thomas Ludlow, privately furnished the security, and Ludlow retired into Essex, where he resided until Oliver Cromwell's death. He then resumed his public course; was active in parliament in the Committee of Safety, in the council of state, and again received a command of troops in Ireland. Accusations were afterwards brought against him

by the council of officers; he was called an opponent of the interests of the army, and charged with high treason. In consequence of these charges he travelled to London, resumed his seat in parliament, and there offered to enter on his defence; but such was the state of confusion at this time, Monk and his forces being daily expected in London, that he was neither heard nor were the proceedings against him advanced any further. When the king was restored, Ludlow, justly estimating his insecurity, fled the country; and after narrowly escaping capture, landed at Dieppe, in September 1660. From Dieppe he went to Switzerland, and having visited Geneva and Berne, resided principally at Vevay. In 1689, wearied with exile, he returned to England, hoping that his offences as a republican were either forgotten or forgiven; but he was disappointed; an arrest was threatened, and he was compelled again to fly to Vevay, where he died in 1693, aged seventy-three years. His memoirs were written in Switzerland, and first printed at Vevay, two volumes in 1698, and a third in the following year. (Ludlow, *Memoirs*.)

LUDOLPHUS, JOB (the Latinised form of his real name LEUTHOLF), was born at Erfurt, the 15th of June 1624, and was educated at the University of Leyden, where he principally studied jurisprudence and the Oriental languages. After leaving Leyden, he remained for some time in Paris as tutor to the sons of the Swedish ambassador. In 1652 he removed to the court of the Duke of Saxe-Gotha, in order to superintend the education of the duke's children. During the latter part of his life he resided at Frankfurt-on-the-Main, where he died on the 8th of April, 1704.

Ludolphus was one of the most eminent Oriental scholars of his age, and appears to have been the first European who acquired a knowledge of the Ethiopic language, which he learnt with the assistance of a native of Abyssinia. He published at London, in 1661, a dictionary and grammar of this language; but a much improved edition of the dictionary appeared at Frankfurt in 1698, and of the grammar in 1702. Ludolphus also paid great attention to the Amharic language, of which he published a dictionary and grammar in 1698.

The most important of Ludolphus's other works are:—'*Historia Æthiopica, sive Descriptio Regni Habessinorum, quod vulgo male Presbyteri Johannis vocatur*,' Frankfurt, 1681; '*Ad Historiam Æthiopicam Commentarius*,' Frankfurt, 1691 (there is an English edition of the '*History of Ethiopia*'); '*Relatio Nova de hodierno Habessiniae statu ex India nuper allata*,' Frankfurt, 1693; '*Appendix Secunda ad Historiam Æthiopicam, continens Dissertationem de Locustis*,' Frankfurt, 1694; '*Epistola Æthiopicæ ad universam Habessinorum gentem scripta*,' Frankfurt, 1683; '*Epistole Samaritanæ Sichemitarum ad Ludolphum*,' with a Latin translation and notes, 1688; and a translation of the Psalms into Ethiopic, Frankfurt, 1701.

* LUDWIG (or LOUIS) I., KARL AUGUST, King of Bavaria, was born August 25, 1786, the son of his predecessor, King Maximilian Joseph. He studied at the universities of Landshut and Göttingen, and served in the campaign against Austria, in the Tyrol, in 1809, but took no part in the subsequent war on account of weak bodily health. In 1810 he married the Princess Therese of Saxe-Hildburghausen, who died in 1854. As crown prince he took little part in state-affairs, but lived in comparative retirement, and on an economic scale, which enabled him to devote much of his income to the development of his favourite plans for the encouragement of the fine arts, particularly architecture. He built the Glyptothek for the reception of his art treasures; and on ascending the throne in 1825, he carried his principles of economy into the management of state affairs, and introduced many reforms. The commercial laws were simplified, and the restrictions on the press made less stringent. His taste for the arts had also now a wider scope given to it: he invited men eminent for their learning or artistic talents to Munich, removed the University of Landshut to Munich, and reorganised the Academy of Arts. Among the artists were Klenze, Gärtner, Cornelius, Schnorr, Schwanthaler, Kaulbach, and others. Many magnificent works were undertaken, among them the Pinakothek, the Odeon, the war-office, the royal palace, a new street, the Linden-strasse, and several churches (particularly the Allerheiligen Kapelle) in Munich; the Walkalla, near Ratisbon, and the Ludwigs-canal. His desire was to have specimens of every kind of architecture, but though many of the buildings are noble examples, the aim at variety has not been successful. All the buildings have been enriched and adorned by the sculptors and painters he had collected around him; and it is not too much to say that the comparatively lost arts of fresco and encaustic painting were re-discovered and perfected through his very liberal patronage, while that of painting on glass was very greatly improved. But not only did he thus win the title of the most munificent patron of art among modern sovereigns, but his example excited a general feeling of emulation throughout Germany, and the influence of the Munich school of art was felt throughout Europe. He also figured as a poet, publishing his collected works in 3 vols. 1839, which, though not invariably adhering to the rules of art, bear testimonies of good feeling and some poetic talent. The first years of his reign thus gave great hopes to his subjects, and the attention of all Germany was directed towards him, but, later on, his extravagant zeal for the restoration of conventual establishments, and the part he took in the political affairs in Europe, as well as an attachment he had formed for

the celebrated Lola Montes, whom he endeavoured to create a countess, considerably lessened the attachment of his subjects towards him. Consequently on the occurrence of the French revolution in February 1848, a movement of a similar character took place in Munich in March. The people captured the arsenal, and demanded extensive reforms. The reforms were promised, and as a first step Lola Montes was sent away. She however was brought back, when the people became frantic. He was forced to cancel her letters of naturalisation, and to give orders for her apprehension. On the 21st of March he abdicated in favour of his son, Maximilian II., the present king. Ludwig has since lived principally in Belgium.

LUIGI, ANDREA DI, commonly called L'INGEGNO, and sometimes ANDREA DI ASSISI, was born at Assisi about the middle of the 15th century.

The common story of this painter, originating with Vasari, has been completely overthrown by Rumohr in his 'Italienische Forschungen.' The account of Vasari, which has been invariably followed by all subsequent writers on the subject, down to the time of Rumohr, is that L'Ingegno was the rival of Raffaele in the school of Pietro Perugino, that he became suddenly blind while assisting his master Perugino in the Sistine Chapel; and that the then pope, Sixtus IV., granted the unfortunate painter a pension for life, which he enjoyed until his eighty-sixth year. Rumohr has shown this account to be, with one exception, wholly incorrect; the only possible part of it is that L'Ingegno assisted Perugino in the Vatican; this he may have done, as he was his assistant in some works in the Cambio, or Exchange, of Perugia.

L'Ingegno cannot have been Raffaele's fellow-pupil with Perugino, for he painted only one year after the birth of Raffaele in 1484, a coat of arms for the town-hall of Assisi, where he was then an established master. He also, long after the death of Sixtus IV., held official situations at Assisi, which can leave no doubt of his retaining his sight. In 1505 he was procurator; in 1507, arbitrator; in 1510, syndic—syndicator potestatis; and in 1511 he was appointed by Julius II. papal treasurer at Assisi—Camerarius Apostolicus in Civitate Assisii. L'Ingegno therefore, instead of receiving a pension from Sixtus IV., received a salary from Julius II., twenty-seven years after the death of Sixtus, who died in 1484. From these several appointments he had probably given up painting, which may have been either owing to weakness of sight or from greater advantages to be had elsewhere: his brother was one of the canons of the cathedral of Assisi.

The only certainly known work by L'Ingegno is the coat of arms already mentioned. The prophets and sibyls in the Cambio at Perugia are assigned to him, but it is quite uncertain what portion of those works was executed by him: the prophets and sibyls also in the Basilica of Assisi were attributed to him, but it has been shown that they were executed in the 16th century by Adone Doni. There are further attributed to L'Ingegno two pictures in the galleries at Berlin and Vienna; and a 'Holy Family' in the Louvre, a beautiful small work in the style of Perugino. Rumohr conjectures, from the style of L'Ingegno in these works attributed to him, that he was the pupil or imitator of Nicolo Alunno. He was probably called L'Ingegno more for a general aptness for business, than for any particular skill in painting.

(Vasari, *Vite de' Pittori*, &c.; Lanzi, *Storia Pittorica*, &c.; Rumohr, *Italienische Forschungen*; Waagen, *Kunstwerke und Künstler in Paris*.)

LUINI, or LOVINI, BERNARDINO, the most celebrated of the scholars and imitators of Lionardo da Vinci, was born at Luino on the Lago Maggiore, about the middle of the 15th century. Luini's reputation is comparatively recent, which is owing to Vasari's silence regarding him, though he evidently alludes to Luini where he speaks of the paintings of Bernardino da Lupino in the church of the Madonna at Saronno. Luini painted much in the style of Lionardo da Vinci, and his works are in many instances, in the opinion of several judges, attributed to Da Vinci; this, according to Waagen and others, is the case with the 'Christ disputing with the Doctors,' in the National Gallery. Fortunately many of Luini's best and greatest works, in oil and in fresco, are still in a good state of preservation, namely, the 'Magdalen,' and 'St. John with the Lamb,' in the Ambrosian Library at Milan; the 'Enthroned Madonna,' painted in 1521, the 'Drunkenness of Noah,' and other works in the gallery of the Brera at Milan; the frescoes of the Monastero Maggiore, or San Maurizio, in the same city, from which however the ultramarine and gold have been scraped off; those already noticed at Saronno; and other extensive and equally good works in the Franciscan convent Degli Angeli at Lugano, on the lake of that name, which were painted subsequently to those at Saronno, and are among the last of Luini's works, but their colours have somewhat suffered. There are also many easel-pictures in oil by Luini, both in and out of Italy, in public and private collections.

Luini's style is something between that of Mantegna and Raffaele, his earlier works approaching nearer to the style of Mantegna, and his later to that of Raffaele; they are elaborately finished, beautifully coloured, and forcibly shaded, yet they want the exquisite tone, the fullness of style, and the greatness of character of the works of Da Vinci; in expression however they approximate very nearly to the works of that great master. Luini excelled chiefly in painting women

and the more delicate qualities of human character. Several of his best works have been engraved in a superior style, by various masters. The paintings at Lugano are described in the 'Kunestblatt' for 1822.

Luini was still living in 1530, but the date of his death is not known. He had two sons, Evangelista and Aurelio, who are both praised by Lomazzo, their contemporary. Aurelio assisted his father in the frescoes at Lugano. After Da Vinci, the founder or 'Caposcuola' of the Milanese school of painting, Gaudenzio Ferrari and Luini are the principal masters of the school, the distinguishing characteristics of which, as a school, are simplicity of subject and composition, expression, force of colour and tone, and minute perspective.

In the gallery of the Brera at Milan there are several frescoes by Luini, and one by his son Aurelio, which have been removed from the walls, and transferred to panel or canvass. Luini was one of the most masterly of the old Italian fresco-painters, and there is a marked difference between the execution of his works of this class and his oil-pictures; they are painted with much more freedom. He must have painted in fresco with remarkable rapidity. According to the observation of Mr. Wilson, who was sent by the English government to Italy to examine the state of the early Italian fresco-paintings, Luini must have executed more than an entire figure of the size of life in a single day: his colouring is warm and transparent, the lights of his draperies being merely thinly glazed, with the colour of the drapery mixed with a little white; the shadows are the pure colour, laid on thickly; the outlines are often strongly indicated in some dark warm colour. He does not appear to have worked from cartoons; in his faces the features are merely indicated by straight lines, yet many of his female heads, painted upon such slight preparation, are among the most beautiful of the Italian frescoes.

(Lomazzo, *Trattato della Pittura*; Lanzi, *Storia Pittorica*, &c.; Waagen, *Kunstwerke und Künstler in England*, &c.; Report of the Commissioners on the Fine Arts, 1843, Appendix.)

LUKE, ST., the Evangelist. Respecting the birth and early life of this evangelist we have no certain information; of his later history we learn something from his own work, the 'Acts of the Apostles.' A considerable knowledge of the Greek language is displayed in his writings, especially in the introduction to his Gospel, which is written in elegant Greek. On the other hand, his language contains many Hebraisms; and he was evidently well acquainted with the religious rites of the Jews, whose mode of computing time he follows. (Luke xii. 1; Acts ii. 1; xii. 3, 4; xx. 6, 16, &c.) Hence it has been much disputed whether he was a Jew or a Gentile before he embraced Christianity. The difficulty is best explained by the opinion of Bolten, confirmed by a tradition current in Jerome's time, that Luke was a Greek by birth, but became a proselyte to Judaism early in life. This opinion is supported by Acts xxi. 28-31, and Coloss. iv. 11, 14. From the former passage we learn that the Jews accused Paul of defiling the temple by bringing into it a Greek, Trophimus of Ephesus. Luke was then with Paul (Acts xxi. 17, 18), and the accusation would have regarded him also, if he had not been looked upon as a Jew by religion. In the latter passage Paul distinguishes Luke from other individuals "who are of the circumcision," which seems to show that Luke was not a Jew by birth; unless indeed the Luke here mentioned be another individual, which we have no reason to suppose. Of the period of his conversion to Christianity we know nothing. Cave and Mill have supposed that he was converted by Paul at Antioch, but they are not supported by any ancient writer; nor is it likely that Luke would have passed over such an event in writing the Acts.

From the passage quoted above (Coloss. iv. 14), and from the testimony of Eusebius, Jerome, and other early writers, it appears that Luke was a physician. Another tradition makes him a painter, but this statement is generally allowed to deserve no credit; and the opinion of Grotius and Wetstein, that he was a slave during part of his life, seems equally unfounded.

Luke's native country is unknown. Eusebius and Jerome say that he was a native of Antioch; but this statement is not found in Irenæus, Clement, Tertullian, or Origen, nor in any writer before the time of Eusebius. Eichhorn has conjectured that this tradition arose from confounding the evangelist with Lucius of Cyrene, who is mentioned as living at Antioch, in Acts xiii. 1. Many writers however entertain the opinion, which is as old as the time of Origen, that this Lucius and the evangelist Luke were the same person. This conjecture is ably maintained by Mr. Charles Taylor, the editor of Calmet.

Some early writers, but of no very high authority, affirm that Luke was one of the seventy disciples sent forth by Christ, whose mission he alone of the evangelists records. (Luke x.) Others mention him as the companion of Cleopas in the journey to Emmaus, recorded in Luke xxiv. 13. It is alleged that the mention of Cleopas while his companion's name is withheld, the fullness and general character of the narrative, and especially the notice of minute circumstances which none but an eye-witness could record, prove that the traveller was the evangelist himself. Other reasons are adduced for believing him to have been in Jerusalem at this time, namely, that the latter part of his Gospel and the earlier chapters of the Acts have every mark of being written by an eye-witness of the facts he narrates, and that all the appearances of Christ after his resurrection mentioned by him took place in the neighbourhood of Jerusalem. To this it is objected that we can only understand the preface to his Gospel (i. 1-4) as a distinct

assertion that St. Luke was not an eye-witness himself, but that he derived his information from others who were eye-witnesses.

In Acts xi. 23, the Cambridge Manuscript has a various reading, "and when we were gathered together, there stood up," &c., which, if admitted, would prove that Luke was connected with the Church at Antioch about A.D. 42; but this reading is not usually accounted of any great authority.

The first distinct mention of Luke in the New Testament is in Acts xvi. 10, 11, where, in relating the vision which Paul saw at Troas, the writer suddenly begins to use the first person plural, whence it is inferred that Luke here joined the apostle (about A.D. 53), whom he accompanied to Philippi (ver. 12). He seems to have remained at Philippi during Paul's journey to Athens and Corinth, for he drops the first person at ver. 17, and does not resume it till he relates Paul's return to Philippi (xx. 5, 6). From this time it appears from the Acts that Luke was Paul's constant companion till his arrival at Rome (about A.D. 61 or 63), where he remained with the apostle for some time, probably during Paul's first imprisonment. He is mentioned more than once in Paul's Epistles written during this period. (Col. iv. 14; 2 Tim. iv. 2; Philem. v. 24.) Some suppose him to be "the brother whose praise is in all the churches," mentioned in the Epistle to the Corinthians (viii. 18; xii. 18). Besides his intimacy with Paul, he is said by Irenæus, Eusebius, Jerome, and other early writers, to have had a considerable acquaintance with the rest of the apostles; indeed they often speak of Luke and Mark as disciples of the apostles, as distinguished from John and Matthew, who were disciples of Christ.

Respecting the end of Luke's life, the tradition is that, after Paul's liberation from his first imprisonment, he retired to Achaia, where he resided some few years, wrote his Gospel and the Acts of the Apostles, and died at an advanced age (some say eighty, others eighty-four years), probably by a natural death, as we have no mention of his martyrdom.

LULLY, or LULLI, JEAN-BAPTISTE, the father of French dramatic music, was the son of a miller, and born at Florence in 1633. Showing in his infant years a strong propensity for music, a kind-hearted monk taught him the use of the guitar, an instrument then as common in Italy at it is now in Spain. Having attracted the notice of the Chevalier Guise, he was by that nobleman recommended to Mademoiselle de Montpensier, niece of Louis XIV., as a page, and sent to Paris in his fourteenth year; but his ready wit and talent found no favour in the eyes of the princess, for they were not set off by either a good figure or a pleasing countenance; he was placed therefore in the kitchen, and commenced his life of activity in the humble capacity of *marmiton*, or scullion. This degradation however did not much discourage him. He had previously acquired some knowledge of the violin, and now dedicated every spare moment to it. His devotion and industry were crowned with success. The report of his skill quickly ascended to the apartments of the princess, who placed him under an able master, and he soon was numbered among the king's twenty-four violins. He now aspired to the rank of composer, and having produced some airs which "with ravished ears the monarch heard," he was individually summoned into the royal presence, commanded to perform himself the compositions which had excited so much pleasure, and from that moment the road to promotion and honour was opened to him. He was immediately placed at the head of a new band, denominated 'Les Petits Violons,' which soon eclipsed the famous *Bande des Vingt-Quatre*.

Lully now was engaged to write music for the Ballets, entertainments of a mixed kind much admired at court. But Louis, ambitious of rivaling the grand operas not long before established at Venice, and encouraged in his design by the Cardinal Mazarin, founded in 1669 the Académie Royale de Musique, an institution which has ever since continued to flourish. At the head of this, Lully, who had been appointed Surintendant de la Musique de la Chambre du Roi, was soon placed, and being associated with Quinault, the admirable lyric poet, carried into effect the king's wishes to their utmost extent. His abilities and exertions were not suffered to remain unrewarded: besides the glory of complete success he acquired a handsome fortune, and was raised to the honourable rank of Secrétaire du Roi. The proud secrétaires hesitated at admitting a marmiton into their number. Lully complained to the king. "I have honoured them, not you," said the monarch, "by putting a man of genius among them."

On the recovery of Louis from a severe operation Lully composed a *Te Deum*, and during a rehearsal of it, while beating the time to the band with his cane, he struck his foot a violent blow, which was followed by serious consequences, and having put himself into the hands of a quack, his life paid the forfeit of his credulity. He died in Paris in 1687, where, in the church des Petits Pères, his family erected a splendid monument to his memory. In his last illness he was attended by a priest, who refused him the consolations of the Church unless he consented to destroy the opera on which he was engaged. He complied: the manuscript was committed to the flames. A friend, entering shortly after, reproached him for having listened to a dreaming Jansenist. "Hush! hush!" whispered the composer, "I have another fair copy of the work in my drawer." As a composer, Lully takes a very high rank. To him music is indebted for some of its greatest improvements, and his works display genius tempered by sound judgment. Even Handel acknowledged that he modelled his

overtures after those of Lully; and Purcell did not hesitate to profit by many hints afforded by the nineteen operas composed by the favourite of Louis le Grand.

LULLY, RAYMUND, surnamed the 'Enlightened Doctor,' was born at Palma, in the island of Majorca, in 1234. In early life he followed his paternal profession of arms in the service of the king of Aragon, and abandoned himself to all the licence of a soldier's life. Passing from extreme to extreme, Lully subsequently retired to a desert, where he pursued a life of solitude and rigorous asceticism. Here he pretended to have had visions, and, among others, a manifestation of Christ on the cross, who called him to his service and the conversion of the Mohammedans.

Hereupon Lully divided all his property among the poor; and in his thirtieth year he began to prepare himself, by diligent study, for the labours and duties of a missionary. Learning Arabic from a slave, he read in that language several philosophical works, the perusal of which, in all probability, suggested those new views of grammar and dialectics by means of which he hoped to reform science, and thereby the world itself. Full of this idea he had a second vision of the Saviour in the semblance of a fiery seraph, by whom he was expressly enjoined to commit to writing and to publish the treatise, to which he himself gave the name of 'Ars Lulla,' but which his followers and admirers dignified by the title of the 'Great Art' ('Ars Magua'). Having besought James of Aragon to establish a monastery at Majorca for the education of thirteen monks in the Arabic language and the duties of missionaries, he went to Rome to seek the countenance of Pope Honorius IV. for similar institutions and his own mission. Receiving however little encouragement, he visited Paris and Genoa with the same design, and with similar success. From Genoa he crossed to Africa, where he was in danger of losing his life in consequence of his dispute with a Mohammedan whom he sought to convert, but was saved by the intercession of an Arabian mufti, on the condition of quitting Africa for ever. This promise however he subsequently considered not to be binding upon him; for after revisiting Italy, and in vain seeking to excite sympathy and co-operation in his designs, he reassumed, unassisted, his enthusiastic enterprise. Proceeding first to Cyprus and thence to Africa, he was nearly stoned to death; and being cast into prison, owed his liberty to the generosity of some Genoese merchants.

Upon his return to Europe Lully visited its principal cities, preaching the necessity of a crusade for the recovery of the Holy Land, a plan of which he laid before Pope Clement V., by whom it was received with little or no favour. Unchecked however by so many disappointments, and with the ardour of his enthusiasm still unabated, Lully returned a third time to Africa, where his zeal for conversion entailed upon him dreadful torments, from which he was a second time rescued by the generosity of the Genoese. The sufferings however to which he had been exposed were so great, that Lully died on his passage home when he was just within sight of his native country in the year 1315.

The 'Ars Magna Lulli,' or the 'Lullian Art,' which found a few admirers, who styled themselves Lullists, after its inventor, and was subsequently revived and improved by the celebrated Giordano Bruno, is an attempt to give a formal arrangement of all ideas, with a view as well to facilitate instruction as to systematise knowledge. The means which this logical machine employs are—1. Letters (alphabetum artes) which stand for certain general terms common to all sciences, but especially to logic, metaphysics, ethics, and theology. 2. Figures, namely, triangles, squares, and circles, which indicate the relations of those general terms. 3. Sections (camerae), in which the combinations of these ideas or terms are formed by the adjustment of the figures. In the angular spaces of the triangles and squares certain predicates are inscribed, and certain subjects on the circles. On the circle of subjects, the triangles of the predicates being so fixed as to move freely, every possible combination of ideas is supposed to be produced by their revolution, according as the angular points successively pass before the letter inscribed on the margin of the circle. Hence arise definitions, axioms, and propositions, which vary infinitely according to the different application of general or particular predicates to particular or general subjects. As however the ideas which are selected for the fundamental notions of this mechanical logic are purely arbitrary, the knowledge to which it professes to lead must be narrow and limited, and at best it does but furnish a few laws of universal notions for analysis and combination. Nevertheless, as the invention, weak as it is, was founded on a feeling of the inadequacy of the dialectic of the schools, and as it furnished a weapon for its opponents, the name of Raymond Lully has been gratefully placed on the list of the reformers of philosophy. In his personal character he seems to claim more justly our admiration for the iron resolution with which, late in life, and for the most part unassisted, he applied himself to the study of science and philosophy, and for the steady resolution with which he persevered in his scheme of converting the heathen in despite of all discouragements and disappointment.

The works of Lully have been edited by Salzinger, 'Raymondii Lullii opera omnia,' in 10 vols. fol., Mayence, 1721-42.

LUNDIN, SIR ALAN, of Lundin, or Lundie, in the shire of Forfar, was son and heir of Thomas de Lundin, who held the office of king's hostiarius, or door ward, and was one of the magnates Scotiæ who ratified the marriage of King Alexander II. with Joanna

of England. Sir Aln early married the bastard daughter of this King Alexander, and before the year 1233 he had succeeded his father in the office of Durward. Before this time also he had imitated his father's munificence to the church, and in the spirit of the age had founded a Dominican convent at Montrose. He was a forward impetuous character, and for twelve years assumed without any authority the title of Earl of Athol.

In 1243 he was appointed lord-justiciar of Scotland, and so continued for about six years, when he was removed under circumstances which strongly mark his audacity and ambition. In 1249 he endeavoured to obstruct the coronation of the infant son of King Alexander II.; and the next year he prevailed on Robert, abbot of Dunfermline, then chancellor of the kingdom, to make a motion in council to legitimate his wife, so that on failure of issue of the king's body she and her heirs might succeed to the throne. For this act the king conceived so great a displeasure that he immediately turned the chancellor out of office, and soon after the justiciar likewise. The latter joined King Henry III. in France, and served in his army; and at length, in 1255, by the influence of the English king, he was re-instated in his office of lord-justiciar, and so continued till 1257, when he was again removed for the powerful Comyn. He died in 1275, leaving three daughters, who carried his great possessions with his blood into other families.

*LUSHINGTON, THE RIGHT HONOURABLE STEPHEN, D.C.L., is the second son of the late Sir Stephen Lushington, Bart., formerly chairman of the East India Company, by Hester, daughter of John Boldero. He was born in 1782, and received his early education at Eton, whence he proceeded in 1799 to Oxford, and graduated B.A. and M.A. at All Souls College, of which he was for some time a Fellow. Having proceeded to the degrees of Bachelor and Doctor of Laws, he was called to the bar of the Inner Temple in 1806, and two years later was admitted an advocate of Doctors' Commons. In 1807 he entered parliament as member for Great Yarmouth, and supported the administration of Fox and Grenville, and voted for the abolition of the slave trade, though he had large property in the West Indies. In 1808 he supported Mr. Tierney's motion for a committee on the trade and navigation laws, and Lord Falkstone's vote of censure on the Indian administration of the Marquis of Wellesley. In 1820 he moved in parliament the recognition of the South American republics in opposition to Lord Castlereagh and Mr. Canning. Together with Lords Brougham and Denman, Mr. Lushington was one of the counsel of Queen Caroline in the memorable trial to which she was subjected, in consequence of the passing of a Bill of Pains and Penalties against that princess. In 1822 he supported as counsel the claims of the *soi disant* Princess Olive of Cumberland. In 1824 he spoke in support of a motion of the then Chancellor of the Exchequer, for a grant of money for the erection of churches, but in the same year he opposed a proposition to repair the Cathedral of Derry out of the public funds. In 1825 he moved the omission of the name of the Duke of Cumberland from the annuities granted by government to the royal family; and in 1830 he supported Lord John Russell's motion for transferring to Leeds, Manchester, and Birmingham, the electoral franchise of constituencies which should be found guilty of bribery and corruption. In 1831 he supported the motion of Mr. C. Grant (Lord Glenelg), for the complete civil emancipation of the Jewish body. He represented at the different times between 1807 and 1831, the boroughs of Tregony, Yarmouth, Ilchester, and other places; in the first reformed parliament however he was chosen for the Tower Hamlets, which he continued to represent down to the dissolution in 1841, retiring in consequence of an act passed in 1839, declaring the Judge of the Admiralty disqualified from sitting in the Commons' House of Parliament. In 1828 he had obtained the appointment of Judge of the Consistory Court, and in 1838 he was preferred to the judgeship of the Admiralty, and sworn a member of the Privy Council. He also holds the Chancellorship of the dioceses of London and Rochester, and is Commissary of Westminster, Essex, and Herts. As a civilian no name stands higher at the present day than that of Dr. Lushington; and his knowledge of ecclesiastical law has been frequently called into exercise in the course of judgments which he has had to pass upon matters connected with the ecclesiastical agitation in the Established Church during the last ten years, on points alike of doctrine, discipline, and ritual observance.

LUTHER, LUDER, or LOTHER, MARTIN, born at Eisleben in Saxony, in November 1483, was the son of Hans Luther, a miner and a worker in metals, who was a native of Eisenach. Young Martin was first sent to the school of Eisenach, where he spent four years, and in 1501 he went to the University of Erfurt. His father intended him to study the law, for which however he felt little inclination, but he applied himself to literature and music, which latter he continued to cultivate during the rest of his life. While at Erfurt he appears to have exhibited the usual jovial careless disposition of a German student. In 1505 an accident occurred which altered the current of his thoughts. One of his fellow-students was killed at his side by lightning, and Luther from that moment made a vow to become a monk. On the 17th of July in the same year he entered the Augustine convent at Erfurt, carrying with him only a Virgil and a Plautus. His father was at first averse from this resolution; but after two years he consented, and was present at the ordination of his son in 1507.

In the retirement of his convent Luther was tormented by temptations and religious scruples and doubts, which he has pathetically described, especially on the subjects of faith and salvation, until he at last adopted the principles of St. Augustine, or at least those ascribed to that father, on grace and predestination. The provincial of his order, Staupitz, a man well-informed, honest, and kind-hearted, administered to him spiritual consolation, and appreciated his talents; and it was through his influence that in 1508 Luther was appointed professor of philosophy in the University of Wittenberg. In his lectures, which were well attended, he appears to have discarded the scholastic forms which were prevalent at the time, and to have appealed to reason more than to authority. In 1510 he was sent by his superiors to Italy on business concerning the order, a circumstance which brought about a crisis in Luther's life. He proceeded to that country, which he looked upon as the centre of Christendom, with his heart full of spiritual hopes and devout expectations; but he was sorely disappointed and shocked at what he there saw. He found pomp and pride, gross sensuality, hypocrisy, and treachery, as he tells us, even in the convents which were his halting-places on the road. He told the monks at Milan that they ought to fast on Fridays, and he was nearly killed for his pains. His health became affected by these occurrences; he fell ill at Bologna, and was confined to his bed for some time. Having recovered, he continued his journey to Rome, and on his arrival repaired to the convent of his order near the gate Del Popolo. There he knelt on the ground "bathed with the blood of martyrs;" he hurried to the various sanctuaries with which the capital of the Christian world abounds; but on looking to those around him, the inmates of the Holy City, he found, to his surprise and grief, what many a young enthusiast has experienced before and since on entering the world, that names and realities, professions and practice, are quite different things. Luther was in fact single in his faith and his religious fervour. Rome at that time, after having passed through the scandalous pontificate of Borgia, was ruled by the choleric and warlike Julius II., who represented the church militant upon earth, and who was then busy about his schemes for humbling Venice and driving the French out of Italy. His cardinals were able diplomats, men of the world, and learned Latinists, better acquainted with Cicero than the Bible. In visiting the churches, Luther was shocked at the indecent hurry with which the priests went through the service of the mass, and at the blasphemous jests which he sometimes heard. Even the ministers of the altar made no secret of their unbelief. Luther remained only a fortnight at Rome: he hurried back to his native Germany with his head bewildered, his feelings distressed, and his religious belief greatly shaken. He used to say however, in after-years, that he would not, for one hundred thousand florins, have missed that journey to Rome, for without it he should have been tormented by the fear of being unjust towards the pope during his subsequent controversy with the papal power.

In 1512 Luther was made doctor of divinity, and Frederic, elector of Saxony, called 'the Wise,' defrayed the expense of his inauguration, which was celebrated with splendour. The reputation of Luther had spread as that of a learned divine and an eloquent preacher. He was well acquainted with scholastic learning, and tolerably so with the Fathers; he knew Greek, but very little Hebrew; he had, above all, deeply studied the Scriptures, which was not a common attainment among ecclesiastics in those days. He was zealous and earnest, devotional in his thoughts, and irreproachable in his morals. In his own order he was appointed provincial vicar of Misnia and Thuringia, in which office he evinced much zeal for the maintenance of discipline and piety in the various monastic houses of that province.

In 1517 Pope Leo authorised by a bull the sale of indulgences in Saxony and other parts of Germany, as his predecessor Julius II. had done in France, Poland, and elsewhere, nominally for defraying the expenses of building the new church of St. Peter's, and also for supporting the league of the Christian powers against the Turks, though little of the money derived from the sale was employed for either purpose. [LEO X.] The practice of selling indulgences had existed for some centuries before Luther. Leo addressed the papal commission for the sale in Saxony to Albert, elector of Mainz and archbishop of Magdeburg, who appointed Tetzel, a Dominican monk, his quaestor, to preach and sell the indulgences through the country. Tetzel appears to have executed his mission with the grossest quackery, enhancing his wares in the opinion of his uninformed and credulous customers by the most absurd exaggerations, and going far beyond the received doctrine of the Roman canonists even of that age. He pretended that his indulgences released not only from penances, but from sin altogether, and from any sin of whatever enormity. Luther, who was then professor of theology at Wittenberg, was shocked at these impious assertions, and while sitting at his confessional in the church of his convent he had practical proof of their mischievous effects. Some of his penitents, who had purchased the indulgences, refused to submit to the penance or reparation which he enjoined, saying that Tetzel had released them from every penalty. Luther having refused absolution, they went and complained to Tetzel, who threatened with both spiritual and temporal punishments all those who denied the efficacy of his indulgences. Luther, little heeding the threats of the Dominican, and being encouraged in his opposition by his own superior Staupitz, who also felt indignant at Tetzel's impudence, drew up ninety-

five theses or propositions concerning indulgences, in which, drawing the distinction between the canonical penalties inflicted by the Church on the penitent sinner, and the penalties required here or hereafter by Divine justice, he maintained that the pope had the power of remitting the former only; that indulgences could not be applicable to the dead; that true contrition of heart and amendment of life would obtain pardon without any papal indulgences; that the true treasures of the Church were contained in the Gospel and in the operation of the Holy Ghost: that at all events, if indulgences be of any avail, they ought to be distributed gratis to the poor, and not to be made an article of trade: and here he exposed in strong colours the avarice, impudence, and licentiousness of the questors, and the fearful corruption of principles and conduct among the poor deluded population resulting from the whole system.

Luther enclosed a copy of his propositions in a letter to the Archbishop of Magdeburg, dated 31st October 1517, beseeching that prelate to interpose to prevent the further spreading of error, and to put a stop to Tetzel's scandalous practices. On the same day Luther affixed another copy of his theses on the gates of the Castle church of Wittenberg, signed with his name, and containing his offer to defend them. This was Luther's first challenge to that power which then kept all Europe in awe, and which he was destined to shake to its very foundations. Though in these celebrated theses there was nothing but what has been maintained by many Roman Catholics, still some of them were certainly at variance with the opinions generally entertained for three centuries before Luther's time, and also with the claim of infallibility assumed by the popes. From the pulpit of the same church Luther repeatedly expounded his propositions, and was eagerly listened to by crowded audiences. His theses spread with the greatest rapidity, and the main principle upon which they rested, namely, that indulgences could only remit the canonical or temporary penalty, gained ground universally throughout Germany. Tetzel and his brother Dominicans, after burning Luther's theses, attempted to answer them by counter-propositions, mainly grounded upon the supreme authority of the pope and his infallibility. But this production injured Tetzel's cause, and a copy of it was publicly burnt by the Wittenberg students. Leo X., when he heard of the dispute, remarked, that it was but a quarrel between monks, and that brother Luther seemed to be a man of parts.

In 1518 Eckius, a professor of divinity at Ingolstadt, took up the controversy against Luther, who answered him, and thus increased his popularity and the number of his adherents, whilst at the same time the warmth of debate carried him beyond his original propositions and led him to touch on the abstruse subjects of free-will and the means of justification. Still it appears that Luther had as yet no intention of separating from the Roman Catholic Church. In May 1518 he addressed a submissive letter to Leo X., in which he says, "I throw myself prostrate at your feet, most holy father; call or recall me, approve or condemn me as you please; I shall acknowledge your voice as the voice of Christ, who presides and speaks in your person." Leo summoned Luther to appear at Rome in sixty days, and there to plead his own cause; but the elector of Saxony interposed, and obtained permission for Luther to be examined within the bounds of the empire, and to be judged by its ecclesiastical laws. Cardinal Caietano, of the order of Dominicans, and papal legate at the diet of Augsburg, was ordered to examine him. Luther, accompanied by Staupitz and another friend, repaired to Augsburg in October 1518, and was received by the cardinal with courtesy; but instead of arguing the point with him, the cardinal assumed an imperious tone, and commanded him to retract because the pope so willed it, and how could he (Luther), a single monk, expect to be able to cope with the pope? (Luther's 'Letter' to Spalatin, chaplain to the elector, and his friend, dated Augsburg, 14th of October.) Luther replied that neither the legate nor the pope could pretend to infallibility, and that St. Peter himself had erred. In one of these interviews however the cardinal was insensibly drawn out from his high ground, and entered the field of controversy, but it would appear with little success. He rejected with scorn what he considered the novel doctrine of justification by faith and by faith alone. In the end, Luther, thinking perhaps of the fate of John Huss, suddenly quitted Augsburg, leaving behind an appeal to the pope, "better informed." In November of the same year Leo issued a bull, declaratory of the doctrine of indulgences, asserting that the pope, as Christ's Vicar on earth, had the power of delivering from all the punishments due to sin those who had repented and were in a state of grace, whether they be alive or dead. On the 29th of November Luther appealed from the pope to a general council of the church.

Meantime the cardinal legate was urging the Elector of Saxony to expel Luther from his dominions. But the elector, who considered Luther as the pride and ornament of his newly-founded university of Wittenberg, would not consent, and the Emperor Maximilian I. having died just at this moment, Frederick, as hereditary vicar of the empire during the vacancy, was a person too important for even Rome to dictate to. Leo commissioned a new legate, a Saxon, named Miltitz, a man of sagacity and prudence, to endeavour to bring Luther to a reconciliation. Miltitz had a conference with Luther at Altenburg, in the beginning of 1519, in which he agreed with Luther in condemning the abuse made by Tetzel of the indulgences, threw the

whole blame of it on that monk's ignorance and profaneness, and so far conciliated the warm but generous spirit of his antagonist as to induce him to write a submissive letter to Leo, dated 13th of March 1519, in which Luther acknowledged that he had carried his zeal and animosity too far, and promised to observe in future a profound silence upon the matter in debate, provided his adversaries would observe an equal temperance; further protesting that he never meant to deny the power of the pope, which was inferior only to that of Christ, and that he would always exhort the people to honour the Roman see, which he had in his writings endeavoured to clear from the impious exaggeration of the questors. "This letter," says Beausobre, "is a sad monument of human weakness," for Luther had already appealed from the pope to the council. Luther's vacillation however may be easily accounted for by reference to the old established reverence for the papal see, the reminiscence of his own early impressions and education, and of his solemn monastic vows, and also to the cordiality and convivial familiarity of his intercourse with Miltitz. It appears that Leo himself wrote to Luther a very mild and conciliatory epistle, published by Loscher in his 'Unschuld Nachricht,' 1742. Miltitz had other conferences with Luther at Leibenwerd and Lichtenberg, which gave great hopes of a full reconciliation, when the polemic intemperance of Luther's personal adversaries widened the rupture and brought the dispute to a crisis. (Seckendorf, 'Commentarius Histor. de Lutheranism.')

Eckius challenged Carlostadt, one of Luther's disciples, to a public disputation at Leipzig, concerning free-will. Carlostadt maintained that since the fall of our first parents our natural liberty is not strong enough to lead us in the path of good without the intervention of divine grace. Eckius asserted that our natural liberty co-operates with divine grace, and that it is in the power of man to consent to the divine impulse or resist it. Eckius seemed to have the best of the argument on his side, when Luther, who had repaired to Leipzig, entered the lists against Eckius, by preaching in the chapel of Duke George's castle a sermon calculated to draw the hostility of Eckius against himself. Eckius, in fact, immediately selected from Luther's works thirteen propositions, which he met by as many counter-propositions. One was concerning the supremacy of the Roman see. Eckius maintained that the church was a monarchy with a head of divine appointment. Luther admitted this, but contended that the head was no other than Jesus Christ. The long acknowledged supremacy of the pope, he observed, extended only to the Western church, and he maintained that it was not *jure divino*, but founded on reasons of policy and tacit consent. Then came the subjects of purgatory, and of indulgences, in which Luther had decidedly the advantage, and partly drew his antagonist to his side. Next were discussed the questions of absolution, grace, free-will, and good works, in which the Catholic divine appeared to prevail in point of argument. Hoffman, the rector of the University of Leipzig, who had been appointed judge of the disputation, refused to declare to whom the victory belonged, and the decision of the matter was referred to the universities of Paris and of Erfurt. Luther however went on publishing several works, 'On Babylonian Captivity,' 'On Christian Liberty,' &c., in which he openly attacked the doctrines and the authority of the church of Rome. Leo now assembled a congregation of cardinals, before whom the works of Luther were laid, and by whose advice a bull of condemnation was drawn up against Luther, and published on the 15th of June 1520, in which forty-one propositions, extracted from his writings, were declared heretical, and as such solemnly condemned; his writings were ordered to be publicly burnt; and Luther himself was summoned to confess and retract within the space of sixty days, under pain of excommunication. Luther having again appealed to the general council of the church, publicly separated himself from the communion of Rome, by burning on a pile of wood, without the walls of Wittenberg, in presence of a vast multitude of people, Leo's bull, and also the decretals and canons relating to the pope's supreme jurisdiction. This was done on the 10th of December 1520, and on the 6th of the following January the pope launched a second bull against him, by which Luther was expelled from the communion of the church for having disowned the supremacy of the Roman Pontiff.

Luther having now irrevocably separated from Rome, gave way to the violence of his temper in several vehement and scurrilous pamphlets, full of coarse vituperation against the pope, whom he openly styled Antichrist.

At the same time Leo urged the new emperor Charles V., in his character of advocate and defender of the church, to make an exemplary punishment of Luther as an obdurate heretic. But Frederick, the elector of Saxony, employed his influence with Charles to have Luther's cause tried by a diet of the empire, which assembled at Worms, in April 1521.

Having obtained the emperor's safe conduct, he repaired to Worms, and was met by multitudes outside of the town. On entering he began singing the hymn "Our God is a strong citadel," which became known as Luther's hymn, and the inspiring song of the Reformation. On the 17th of April he appeared before the emperor, the electors, bishops, dukes, margraves, and other princes and lords assembled, and being asked whether he was the author of the books now produced, in which the propositions condemned by the pope were contained, he

answered in the affirmative. Being next asked whether he would retract or maintain them, he begged for time to consider of his answer, and was allowed one day. The following day he appeared again before the assembly, and said that his writings were of various character, that in some he had treated only of Christian faith and piety, and these could contain nothing objectionable; that in some he had exposed the inventions of men and the usurpations of the popes, and these he could not retract; that in others, which were directed against the defenders of the pope, he might have expressed himself in an unbecoming manner, but that he could not retract the substance however censurable the manner of it; that, being a man, he was liable to error, and that he was ready, if convicted by the testimony of the Scriptures, to commit a portion or the whole of his publications to the flames. And he repeated what he had already said on another occasion, that both pope and council were liable to error, and had in fact often erred. He had formerly quoted the council of Constance as an instance of his assertion.

On the following day Charles V. told the diet that, attached as he was to the Roman Catholic Church, he should ever defend its doctrines and constitution; that he could hear Luther no more; and that he should dismiss him, and afterwards treat him as a heretic. This decision was also that of the majority. Some were for trying persuasion and entreaty with a man who, like Luther, could not be frightened into submission; but entreaty was likewise of no avail, for Luther refused to retract a single proposition unless proved to be erroneous by the authority of the Scripture. He was then ordered to leave Worms, with a written promise of security for twenty-one days. He left on the 26th of April, but on entering a forest his carriage was stopped by a party of armed horsemen in masks, who placed him on horseback, and rode off with him to the solitary castle of Wartburg, situated on a mountain. This was another contrivance of his kind protector the Elector of Saxony. The greatest secrecy was observed concerning the place of his retreat, and it was purposely reported about that his enemies had carried him off. A month after his departure an imperial edict appeared, placing Luther under the ban of the empire, ordering him to be seized and retained in prison at the emperor's pleasure, and imprisonment and confiscation were denounced against any one who aided and abetted him. But the edict could not be enforced. The Elector of Saxony was Luther's friend; few, if any, of the other electors or princes were his enemies, and the popular voice was for him; for the Germans in general, although few of them understood the subject-matter of Luther's polemics, were weary of the abuses and encroachments of the ecclesiastical power.

In his asylum at Wartburg Luther wrote several treatises against auricular confession, against monastic vows, clerical celibacy, and prayers for the dead; against the Sorbonne of Paris, which had condemned his works, and which he exposed to public ridicule. His writings spread and produced a wonderful effect in Saxony. Hundreds of monks quitted their convents and married. The Augustin friars of Wittenberg abolished the mass. Carlstadt, a disciple of Luther, but more intemperate than his master, accompanied by a band of reformers, demolished the images in the church of All Saints at Wittenberg, and next proposed to banish all books from the university except the Bible. He also affected to obey to the letter the sentence pronounced on Adam by going to work in the fields for some hours daily. Even the polished Melancthon followed the example, and went to work in a baker's shop.

Luther, in his retirement, heard of these follies; he perceived that fanaticism was spoiling his cause; and he resolved immediately, without heeding his own danger, to return to Wittenberg (1522). He rebuked Carlstadt, who retorted, calling him an idolater because he believed in the real presence in the sacrament, and a courtier for living on terms of intimacy with princes. At last they parted in anger: Carlstadt was banished from Saxony as a seditious person by the elector for inculcating the principles of natural equality, and he went to join Zuingli in Switzerland.

Luther was now the acknowledged leader and oracle of the reformers of Germany, and as such he continued to the end of his life. The doctrines which he gradually asserted were expounded and fixed by his disciple Melancthon in the Confession of Augsburg, and are such as are generally recognised by the term Protestant. At the close of 1522 he published his German version of the New Testament. In 1523 he preached against the mass. He had already replied, in his usually scurrilous style of polemics, to the treatise in defence of the sacraments written by Henry VIII. of England. It must be observed however that the coarse vituperations which shock the reader in Luther's controversial works were not peculiar to him, being commonly used by scholars and divines of the middle ages in their disputations. The invectives of Valla, Filelfo, Poggio, and other distinguished scholars, against each other are notorious; and this bad taste continued in practice long after Luther down to the 17th century, and traces of it are found in writers of the 18th, even in some of the works of the polished and courtly Voltaire.

In 1524 Luther threw off his monastic dress, and definitively condemned monastic institutions. Convents both of men and women were now rapidly suppressed throughout North Germany, and their property was seized by the secular power: indeed there can be no doubt that the hope of plunder contributed greatly to the encourage-

ment which the princes and electors gave to the new doctrines. The insurrection of the 'Wiedertäufer,' or Anabaptists, led by a fanatic named Muntzer, which assumed the character of a peasant war against all property and law, gave great concern to Luther, who was taunted by many with being the source from which all those aberrations flowed. He preached against the fanatics, he tried to mediate, he besought the peasants to lay down their arms, and at the same time he told the princes to redress the grievances of the poor; but the insurgents were too far gone in their career of bloodshed and devastation, and nothing but the sword could put a stop to it. Luther was sorely grieved throughout the rest of his life at the renewed disorders of the Anabaptists and other fanatics on one side, and on the other at the selfishness, worldliness, and corruption of all classes. He fancied at times that the end of the world must be nigh, for the world had fallen into decrepitude; avidity and self-interest were the ruling passions. (Luther's 'Table-Talk,' and his 'Letters.')

In 1525 Luther married Catherine de Bora, a young nun who had left her convent the year before. He had long before condemned the obligation of clerical celibacy, as well as that resulting from monastic vows, as being human devices unknown to the original church. "Marriage in its purity," he wrote, "is a state of simplicity and peace." When Luther married he was poor, for amidst the great change from the old to the new system of church discipline, his salary, which was charged upon the revenues of monastic property, was by no means regularly paid, and Luther was not a man to ask money of his friends. In the same year his steady and considerate patron Frederic of Saxony died; but John, his successor, not only continued to favour Luther, but made open profession of his doctrines, and commissioned him to prepare a new church service for his dominions, in addition to which Luther wrote a larger and a small catechism for the use of schools, in a style admirably suited to youth. Besides the Elector of Saxony, the Elector Palatine, the Landgrave of Hesse, the Duke of Deux Ponts, the Margrave of Brandenburg and grand-master of Prussia, and also many cities in other parts of the empire, openly embraced Luther's reformation. In Switzerland however another reformer, Zuingli, who had begun, like Luther, by opposing indulgences, had also effected a reformation, but he inculcated tenets different in some respects from those of Luther, especially on the subject of the real presence in the sacrament, which Luther admitted, and Zuingli entirely denied. Luther was vexed at this division, especially as several towns of Germany, Strasbourg, Ulm, Meiningen, Lindau, Constance, and others, adopted Zuingli's tenets.

In March 1529, a diet was convoked at Speyer, in which the Roman Catholics endeavoured to enforce the edict of Worms, but the opposition of the Elector of Saxony, the Landgrave of Hesse, the Margrave of Brandenburg, and the deputies of the imperial cities, caused its rejection. The Roman Catholics then endeavoured to separate the reformers; they drew up a decree, apparently directed against those who denied the real presence, but so worded as to include the Lutherans also, who refused their sanction to it. It was on this occasion that the reformed princes and deputies delivered a formal "Protestation" against the decree, dated Speyer, 19th of April 1529, which was signed by John, elector of Saxony, George, margrave of Brandenburg, Philip, landgrave of Hesse, Ernest and Francois, dukes of Lüneburg, Wolfgang, prince of Anhalt, and the deputies of fourteen cities. From this protestation arose the name of "Protestants," which in its origin was applied to the Lutherans.

The Landgrave of Hesse, wishing if possible to bring about a union among all reformers, succeeded in appointing a conference between Luther and Melancthon on one side and Zuingli and Oecolampadius on the other at Marburg. The conference turned chiefly on the subject of the real presence, but it produced no approximation among the opposite parties. They separated neither in friendliness nor hostility, and both parties retained their favourite tenets. In 1530 a diet was convoked at Augsburg by Charles V., who attended it in person, and there the Lutherans presented their confession of faith, which was drawn up by Melancthon and approved by Luther.

In 1534 Luther completed his greatest work, the German version of the Bible, which is much admired for its elegance, force, and precision, and which has rendered the Scriptures really popular in Germany.

The remaining years of Luther's life were passed in comparative quiet, chiefly at Wittenberg, in the duties of his professorship, in writing religious and controversial tracts, and in epistolary correspondence. He was consulted by the Protestant princes and clergy upon all important matters, and listened to with deference. The pacification of Nürnberg in 1532 had left the Lutheran princes, states, and towns in full possession of their religious liberties; and that peace was not openly interrupted till after Luther's death. Luther had the satisfaction of seeing his doctrines spread farther and farther through Germany, throughout Saxony and Brandenburg, to Moravia and Bohemia, Denmark, and Sweden. He also effected a reconciliation with the so-called Sacramentarians of Strasbourg, Ulm, and other towns, by means of Bucer, so that all reformed Germany was united under one banner. The Helvetic reformed churches however continued separate from his.

At the beginning of 1546 Luther repaired from Wittenberg to Eisleben for the purpose of reconciling the counts Mansfeld, whose subject he was born. He attended several conferences for that bene-

volent purpose, and succeeded in restoring peace to that family. While at Eisleben he preached four times, and also revised a plan of regulations concerning the ecclesiastical discipline of that little state. He had been for some time in a very precarious state of health: on the 17th of February he felt very ill and weak, laid himself on a couch, spoke of his approaching death, for which he appeared quite prepared, and recommended his soul to Jesus. He grew worse in the evening. Count Albrecht of Mansfeld and his countess and several medical men attended him during his last hours. His old friend Dr. Jonas having asked him: "Reverend father, do you die with a firm conviction of the faith you have taught?" Luther in a distinct voice replied "Yes," and soon after breathed his last. His body was carried to Wittenberg, where he was buried with great honours. Shortly before his death he wrote several affectionate letters to his wife, who had remained at Wittenberg with her children. He left her by his will a house which he had purchased, as well as a small estate at Zeilsdorf, charging her to pay his debts, which amounted to 450 florins; and he left her also a few valuable trinkets and other moveables, worth about 1000 florins. "I leave," he wrote, "no ready cash or hidden treasure, as I have had no other income but my salary and a few presents, and yet have managed to keep an establishment and purchase property."

Luther's works, which are multifarious and voluminous, partly in Latin and partly in German, have been repeatedly published: a complete edition was published at Erlangen in 26 vols. 12mo, 1826-33. Among his works, those of most interest to the general reader are his 'Table Talk' ("Tischreden"), his familiar letters, and his sermons. Luther ranks high among German writers for the vigour of his style and the development which he imparted to his vernacular language. Schroeck, Melancthon, and others have written biographies of Luther, and Michelet has extracted a kind of autobiography from numerous passages of his works: 'Mémoires de Luther, écrites par lui-même, traduits et mis en ordre,' 2 vols. 8vo, Paris, 1835. In the character of Luther there was no calculation, reserve, or hypocrisy. He was frank and vehement, and often intemperate. But he was in earnest in his vehemence; he really felt the importance of the topics he was discussing; and whether he was right or wrong in his peculiar opinions, he was a sincere and zealous believer in the Christian Revelation. Luther considered religion as the most important business of man, and because he considered it as such, he wished to ascend to its very source unalloyed by human authority. He contended for the right of every man to consult the great book of the Christian law; and although he insisted upon his own interpretation of particular passages of the Scriptures, the principles of free inquiry which he introduced led to further results, and gradually established that liberty of conscience which now exists in the Protestant states of Europe. But Luther himself, whilst he appealed to the Scriptures against human authority, did not for a moment admit of any doubts concerning the truth of revelation. The question between Luther and his antagonists is therefore of material importance chiefly to Christians. To those who do not believe in Christianity it may appear of little consequence what Christians do believe, or how and whence they derive their belief; but even in a social point of view it is of some importance to decide whether large multitudes of men are to exercise their own judgment and be able to give reasons why they believe certain doctrines, or whether they are for ever to repeat, generation after generation, whatever they have been taught in their youth, without exercising their reasoning powers on the matter.

Those who judge of Luther's disposition merely from his controversial style and manner greatly mistake his character. He was a warm-hearted German, kind and generous; he abused and vilified his antagonists the more in proportion as they were powerful, but he could feel for the unhappy, and he even tendered some consolation to his bitterest enemy Tetzels, when, forsaken by his employers, and upbraided as the cause of all the mischief, he was in the agonies of death and despair.

Luther gave that impulse towards spiritual philosophy, that thirst for information, that logical exercise of the mind, which have made the Germans the most generally instructed and the most intellectual people in Europe. Luther was convinced of the necessity of education as auxiliary to religion and morality, and he pleaded unceasingly for the education of the labouring classes, broadly telling princes and rulers how dangerous as well as unjust it was to keep their subjects in ignorance and degradation. He was no courtly flatterer; he spoke in favour of the poor, the humble, and the oppressed, and against the high and mighty, even of his own party, who were guilty of cupidity and oppression. Luther's doctrine was altogether in favour of civil liberty, and in Germany it tended to support constitutional rights against the encroachments of the imperial power.

Luther's moral courage, his undaunted firmness, his strong conviction, and the great revolution which he effected in society, place him in the first rank of historical characters. The form of the monk of Wittenberg emerging from the receding gloom of the middle ages, appears towering above the sovereigns and warriors, statesmen and divines of the 16th century, who were his contemporaries, his antagonists, or his disciples.

(J. Alb. Fabricius, *Centifolium Lutherianum*, 2 vols. 1728-30, gives a list of all the authors who had then written concerning Luther and his Reformation.)

LUTI, BENEDETTO, Cavaliere, a celebrated Italian painter, was born at Florence in 1666. He was the scholar of A. D. Gabbiani, and he went about 1690 to Rome, where he appears to have settled for the remainder of his life. He died in 1724.

Luti has been called by some the last of the Florentine masters. His style is very attractive, but it is more distinguished for agreeable than for great qualities. He painted in fresco and in oil, and executed also many pastel-drawings, a style much practised by the Florentine masters of the 17th century. Luti's masterpiece is the large picture of the 'Vest of San Ranieri,' in the cathedral of Pisa, and it is reckoned the best picture in the church. Luti had always a great respect for his master Gabbiani, and after he had finished this picture, in 1712, he sent it to Florence to Gabbiani for his correction before it was placed in its final destination. There are several good engravings from Luti's works.

LÜTZELBURGER, or LEUTZELBURGER, HANS, called also HANS FRANK, an early Swiss wood-engraver of Basel, about whom very much has been written but very little is known. He lived in the early part of the 18th century, and is supposed by some to have cut the blocks of the celebrated 'Dance of Death,' attributed to Holbein. This supposition however is founded solely on the facts of his being contemporary with Holbein, and the circumstance of one of the cuts being marked H. L. This is maintained by some writers and combated by others, and especially by Rumohr in 1836, in a work entitled 'Hans Holbein der Jüngere in seinem Verhältniss zum Deutschen Formschneidwesen' ('Hans Holbein the Younger, in his relation to German Wood-engraving'). There are many other celebrated old cuts, singly and in sets, some from drawings by Holbein, which are attributed to Lützelburger, and which are described at length in the 'Kunstblatt,' and in the works of Bartsch, Heller, Massmann, and other writers on wood-engraving.

LYCOPHRON, a native of Chalcis in Eubœa, the son of Socles, and adopted by the historian Lycus of Rhegium, was a distinguished poet and grammarian at the court of Ptolemy Philadelphus, from B.C. 280 to 250, where he formed one of the seven poets known by the name of Pleias. He is said by Ovid to have been killed by an arrow. ('Ibis,' 581.)

Lycophron wrote a great number of tragedies, the titles of many of which are preserved by Suidas; but only one has come down to us, entitled 'Cassandra, or Alexandra.' This poem however cannot have any claims to be called a drama: Cassandra is the only person introduced as speaking, and she narrates to Priam the destruction of Troy, and the subsequent adventures and misfortunes of the Grecian chiefs. But in the course of her narration she gives an account of almost all the leading events in Greek history, from the Argonautic expedition to the time of Alexander the Great. The work is written in iambic verse, and has no pretensions to any poetical merit; the style is very obscure, and the meaning of most passages very doubtful, which led Statius to describe it as the 'Latebras Lycophronis atris.' ('Silv.,' v. 3, 157.) But from the quantity of mythological and historical information which it contained, and perhaps from its very obscurity, it formed a favourite study with the Greek grammarians, who wrote many commentaries upon it, of which the most celebrated, by Tzetzes, who lived in the 12th century of the Christian era, is still extant, and affords no small assistance in making out the meaning of this difficult poem.

The 'Cassandra' was printed for the first time at the Aldine press, Venice, 1513. The best editions are by Potter, Oxf., 1697, 1702; by Reichard, Leip., 1788; by Sebastian, Rome, 1804; and by Bachmann, Leip., 1833. The commentary of Tzetzes has been published with most of the editions of the 'Cassandra,' and has also appeared in a separate form under the superintendence of C. G. Müller, Leip., 1812. The 'Cassandra' has been translated into English by Lord Royston.

LYCURGUS, the lawgiver of Sparta, of whose birth and the period of his existence the accounts are very discordant. By some even his reality has been doubted, but we think without sufficient reason. Aristotle makes him a contemporary of the king Iphitus, who lived B.C. 884. Xenophon places him 200 years earlier. He was certainly of the royal family, but his name does not occur as king among the oldest monuments of Grecian history. Herodotus calls him the guardian of his nephew; Labotas, the Eurythend. Simonides says he was the brother of Eunomus the Proclid; Dionysius, that he was the uncle of Eunomus; and the more common account, that he was the son of Eunomus, and guardian to his young nephew Charilaus, the son of Polydectes, brother of Lycurgus. It is certain that historically nothing is known sufficiently to verify a single act attributed to Lycurgus; but as all ancient history concurs in attributing to him the formation of the constitution under which Sparta so long continued to hold an eminent rank in Greece, even the fictions (if they are fictions) possess considerable interest. Laconia, from its earliest settlement by the Dorians, was governed by two kings. In the time of Lycurgus the nation was rent by dissensions: the kings were aiming to become despots; the people anxious to establish a democracy. On the death of Polydectes he left his queen pregnant, who proposed that Lycurgus should marry her, mount the throne, and that she should destroy her unborn offspring. Lycurgus temporised till a son was born, whom he immediately caused to be proclaimed king; and to avoid any suspicion of a sinister ambition shortly after set out upon

his travels. The common accounts make these marvellously extensive. He is said to have visited Crete, Asia Minor (there to have met with Homer, or at least found the Homeric poems), Egypt, Libya, Iberia, and India; and in all these countries to have studied their political constitutions. He at length, fortified by a prediction from Delphi declaring his eminent wisdom, returned to his native land, which he found reduced to a pitiable state by the continued dissensions of the various parties, who all however joined in imploring him to undertake the reformation of the state. He complied. Of the nature of his constitution an historical account will be found in the GEOGRAPHICAL DIVISION, under the head of SPARTA. Having accomplished this object, though not without an active opposition that even threatened his life, he exacted an oath from the people that no change should be made in any of the institutions, and then voluntarily exiled himself, so that they should never be released from their oath. He first proceeded to Delphi, whence he transmitted a sanction of his institutions from the oracle. Nothing is recorded as to his death, though Delphi, Crete, and Elis, all claimed his tomb; but there was a legendary belief that he had been called to join the gods, and a temple was erected in Sparta to his memory. It is tolerably certain however that many of the institutions supposed to be peculiar to Sparta were in existence in Sparta itself, as well as in other parts of Greece, before the time of Lycurgus.

LYCURGUS, the Athenian orator, the son of Lycophron, and the grandson of Lycurgus, who is ridiculed by Aristophanes ('Birds,' l. 1296), was one of the warmest supporters of the democratical party in the contest with Philip of Macedon. The time of his birth is uncertain, but he was older than Demosthenes (Liban., 'Arg. Aristogiton'); and if his father was put to death by the Thirty Tyrants ('Vitæ Decem Orat.,' p. 841, B), he must have been born previous to B.C. 404; but the words of the biographer are, as Mr. Clinton has justly remarked ('Fast. Hell.,' vol. ii., p. 151), ambiguous, and may imply that it was his grandfather who was put to death by the Thirty.

Lycurgus is said to have received instruction from Plato and Isocrates. He took an active part in the management of public affairs, and was one of the Athenian ambassadors who succeeded (B.C. 343) in counteracting the designs of Philip against Ambracia and Peloponnesus (Demosth., 'Philip,' iii., p. 129, ed. Reiske.) He filled the office of treasurer of the public revenue for three periods of five years, that is, according to the ancient idiom, twelve years (Diod. Sic., xvi. 88); and was noted for the integrity and ability with which he discharged the duties of his office. Böckh ('Public Economy of Athens,' vol. ii., p. 183, Engl. transl.) considers that Lycurgus was the only statesman of antiquity who had a real knowledge of the management of finance. He raised the revenue to twelve hundred talents, and also erected during his administration many public buildings, and completed the docks, the armoury, the theatre of Bacchus, and the Panathenaic course. So great confidence was placed in the honesty of Lycurgus, that many citizens confided to his custody large sums of money; and shortly before his death he had the accounts of his public administration engraved on stone and set up in part of the wrestling-school. An inscription, preserved to the present day, containing some accounts of a manager of the public revenue, is supposed by Böckh to be a part of the accounts of Lycurgus. (See the inscription in Böckh's 'Corpus Inscriptionum Græcarum,' vol. i., p. 250, No. 157.)

After the battle of Chæroneia (B.C. 338) Lycurgus conducted the accusation against the Athenian general Lysicles. He was one of the orators demanded by Alexander after the destruction of Thebes, B.C. 335. He died about the year B.C. 323, and was buried in the Academia. (Pausan., l. 29, § 15.) Fifteen years after his death, upon the ascendancy of the democratical party, a decree was passed by the Athenian people that public honours should be paid to Lycurgus; a brazen statue of him was erected in the Ceramicus, which was seen by Pausanias (i. 8, § 3), and the representative of his family was allowed the privilege of dining in the Prytaneum. This decree, which was proposed by Stratocles, has come down to us at the end of the 'Lives of the Ten Orators.'

Lycurgus is said to have published fifteen orations ('Vitæ Decem Orat.,' p. 843, C.; Photius, 'Cod.,' 268); of which only one has come down to us. This oration, which was delivered B.C. 330, is an accusation of Leocrates (κατὰ Λεωκράτους), an Athenian citizen, for abandoning Athens after the battle of Chæroneia, and settling in another Grecian state. The eloquence of Lycurgus is greatly praised by Diodorus Siculus (xvi. 88), but is justly characterised by Dionysius of Halicarnassus as deficient in ease and elegance (vol. v., p. 433, ed. Reiske).

The best editions of Lycurgus are by Taylor, who published it with the 'Oration of Demosthenes against Midias,' Camb., 1743; Becker, 1821; Pinzger, 1824; Blume, 1827; Baier and Sauppe, 1834; and Mätzner, 1836. It is also included in the edition of the 'Oratores Græci,' by Reiske and Bekker, and has been translated into French by Auger, Paris, 1783.

LYDGATE, JOHN, an ancient English poet, one of the successors of Chaucer, was a monk of the Benedictine Abbey of Bury St. Edmunds in Suffolk. The dates of only a few of the events of his life have been ascertained. He was ordained a subdeacon in 1389, a deacon in 1393,

and a priest in 1397; whence it has been conjectured that he was born about 1375. Warton says he seems to have arrived at his greatest eminence about 1430. After a short education at Oxford, he travelled into France and Italy, and returned a complete master of the language and literature of both countries. He chiefly studied Dante, Boccaccio, and Alain Chartier, and became so distinguished a proficient in polite learning, that he opened a school in his monastery for teaching the sons of the nobility versification and composition. Although philology was his subject, he was not unacquainted with the philosophy of the day: he was not only a poet and a rhetorician, but a geometrician, an astronomer, a theologian, and a disputant. Warton was of opinion that Lydgate "made considerable additions to those amplifications of our language, in which Chaucer, Gower, and Occleve led the way;" and that he was the first of our writers whose style was clothed with that perspicuity in which the English phraseology appears at this day to an English reader.

To enumerate Lydgate's pieces would be to write the catalogue of a little library; Ritson, in his 'Bibliographia Poetica,' has given a list of no fewer than two hundred and fifty-one. No poet seems to have possessed greater versatility. His most esteemed works are his 'Story of Thebes,' his 'Fall of Princes,' and his 'History, Siege, and Destruction of Troy.' The first is printed by Spight in his edition of Chaucer; the second, the 'Fall of Princes,' or 'Boke of Johan Bochas' (first printed by Pynson in 1494, and several times since), is a translation from Boccaccio, or rather from a French paraphrase of his work, 'De Casibus Virorum et Feminarum Illustrium.' 'The History of Troy' was first printed by Pynson in 1513, but more correctly by Marhe in 1555, and was once the most popular of his works.

A pension of 7*l.* 13*s.* 4*d.* for life was granted to Lydgate by King Henry VI. in 1440, probably upon the presentation to that monarch, when he visited St. Edmunds Bury, of a manuscript Life of St. Edmund, the patron saint of the monastery. This manuscript is still preserved in the Harleian collection in the British Museum, No. 2278, and is one of the most splendidly illuminated manuscripts in that great repository which also contains in the old Royal, Cottonian, Harleian, and Lansdowne collections, other splendid manuscripts of Lydgate's various poems.

A note in Wanley's part of the 'Harleian Catalogue of Manuscripts' seems to insinuate that Lydgate did not die till 1482, which is improbable. He was certainly alive in 1446; and the best authorities place his death about 1461.

LYDUS, JOANNES LAURENTIUS, was born at Philadelphia in Lydia (whence he derived his surname) about A.D. 490. At the age of twenty-one he repaired to Constantinople, and was employed for forty years at the court of the emperor in various official duties. He died about the latter end of Justinian's reign. Lydus appears to have been well acquainted with Greek and Roman antiquities; and his works, which are said to have been written after he had retired from the Imperial court, contain much curious information on the mythology and history of several of the nations of antiquity.

Three works of Lydus have come down to us—one 'On the Magistrates of the Roman Republic,' edited by Hase, Paris, 1812; a second, 'On the Months,' which was originally published by Schow, Leipzig, 1794, and has since been edited by Roether, Leipzig, 1827; and a third, 'On Omens and Prodigies,' which has also been published by Hase, with a fac-simile of the manuscript from which the edition has been printed. The best edition of Lydus is by Bekker, Bonn, 1837, which forms a part of the 'Corpus Scriptorum Historiæ Byzantinæ.'

LYE, EDWARD, an English clergyman, distinguished by the attention which he paid to the Saxon and Gothic languages and literature, was born at Totness in 1704. He was educated in the University of Oxford, and received the living of Houghton Parva in Northamptonshire, which he exchanged for that of Yardley Hastings. This appears to have been all the preferment he enjoyed. He died in 1767.

The publications of Lye are all in that rare department of literature to which he especially devoted himself. The first was an edition of the manuscript left by Francis Junius [JUNIUS], entitled 'Etymologicum Anglicanum.' This manuscript had long lain in the Bodleian Library, no one having the courage or the knowledge and leisure sufficient to undertake the publication of it, to the great regret of all scholars both at home and abroad. This Lye accomplished, and the work appeared, with some additions and suitable prolegomena, in a folio volume, 1743. He also published, at the desire of Berzelius, bishop of Upsal, an edition of that singular remnant of the Gothic language, the parent of many dialects, the translation of the Evangelists, commonly called Ulphilas's version. During the whole course of his studies he had kept in view the preparation of a large dictionary of the Anglo-Saxon and Gothic languages. This great undertaking he had just completed, having actually delivered the manuscript to the printer, when death took him away. His labour however was not lost, the work being published in 1772 in two folio volumes. There is a fuller account of this eminent person in Nichols's 'Literary Anecdotes of the Eighteenth Century,' vol. ix., pp. 751-753.

* LYELL, SIR CHARLES, an eminent living geologist, is the eldest son of Charles Lyell, Esq., of Kinnordy, Forfarshire, who died in 1849. Sir Charles was born at Kinnordy, in Forfarshire, on the 14th of November, 1797. He received his early education at Midhurst, in Sussex, and was subsequently entered at Exeter College, Oxford,

where he graduated as B.A. in 1819 and M.A. in 1821. Here he had the opportunity of attending the lectures of Dr. Buckland, professor of geology, and thus acquired a taste for the science of which he has been so conspicuous a cultivator. He was however destined for the bar, and commenced practice as a barrister. His circumstances not rendering his profession necessary for a livelihood, and his tastes leading him to the culture of geology, he ultimately abandoned the practice of the law. On the opening of King's College in 1832 he was appointed professor of geology, but this position he soon gave up.

Mr. Lyell was one of the early members of the Geological Society, and from the time of the formation of that society to the present he has enriched its 'Transactions' with his contributions. One of his earliest papers was published in the second volume of those 'Transactions,' and was entitled, 'On a Recent Formation of Freshwater Limestone in Forfarshire, and on some Recent Deposits of Freshwater Marl; with a Comparison of Recent with Ancient Freshwater Formations; and an Appendix on the Gyrogonite, or Seed-Vessel, of the Chara.' This paper was published in 1826, and another in the same year, in 'Brewster's Journal of Science,' entitled, 'On a Dike of Serpentine cutting through Sandstone in the County of Forfar.' In 1827 two other papers occur in the 'Geological Transactions,' one 'On the Strata of the Plastic Clay Formation exhibited in the Cliffs between Christchurch Head, Hampshire, and Studland Bay, Dorsetshire;' the other, 'On the Freshwater Strata of Hordwell Cliff, Beacon Cliff, and Barton Cliff, Hampshire.' In this year also he wrote an article in the 'Quarterly Review' on Scrope's 'Geology of Central France.' These papers all indicate powers of observation and comparison of a high order, and prepared the geological world for the appearance of the work on which above all others the reputation of Sir Charles Lyell mainly rests; this was his 'Principles of Geology.' The first volume of this work appeared in January 1830, the second in January 1832, and the third volume in May 1833. Such however was the impression produced by this work that second editions of the first and second volumes were required before the third volume appeared. A third edition of the whole work in four volumes appeared in May 1834, a fourth edition in 1835, and a fifth in 1837. This work treated geology from two points of view. First, the history of the earth was examined with regard to its *modern* changes, and the causes producing them; second, an account was given of those monuments of analogous changes of *ancient* date. The first comprehending an account of the forces at work producing geological changes, and the second presenting a survey of the changes that had been accomplished in the past. As new editions of these works were required, and materials accumulated, the author was induced to separate the two parts of the work, and in 1838 he published a volume entitled 'Elements of Geology,' which contained a more full and elaborate treatment of that part of the first work devoted to the ancient history of the earth, or what may be called geology proper. A second edition of this work, in two volumes, appeared in 1841. This work was again produced in one large volume in 1851, with the title of 'Manual of Elementary Geology.' A fourth edition appeared in 1852, and a fifth has since appeared. The 'Principles' were again published in three volumes in 1840, and in one large volume in 1847, 1850, and 1853.

Of these works, Sir Charles says, in his preface to the ninth edition of the 'Principles,' 'The 'Principles' treat of such portions of the economy of existing nature, animate and inanimate, as are illustrative of geology, so as to comprise an investigation of the permanent effects of causes now in action, which may serve as records to after ages of the present condition of the globe and its inhabitants. Such effects are the enduring monuments of the ever-varying state of the physical geography of the globe—the lasting signs of its destruction and renovation, and the memorials of the equally fluctuating condition of the organic world. They may be regarded as a symbolical language, in which the earth's autobiography is written. In the 'Manual of Elementary Geology,' on the other hand, I have treated briefly of the component materials of the earth's crust, their arrangement and relative position, and their organic contents, which, when deciphered by aid of the key supplied by the study of the modern changes above alluded to, reveal to us the annals of a grand succession of past events—a series of revolutions which the solid exterior of the globe and its living inhabitants have experienced in times antecedent to the creation of man.' Such is the author's account of the two great works, which more than any others have exercised an influence on the progress and development of geological science. It was undoubtedly the 'Principles' that called the attention of geologists to the necessity of regarding the past changes of the earth's surface as resulting from causes now in operation. It demanded that geological science should be placed upon the same foundation as the other inductive sciences, and that those causes which could not be demonstrated to have existed should cease to influence the theories of the geologist. This work was at once acknowledged by the abler geologists of the day as an expression of the principles of their science. It met however with great opposition from those who imagined that it interfered with the authoritative declarations of Scripture. Sir Charles Lyell's own university was most decided in its opposition to the new views, although its able professor of geology was not so. At the present time, the position taken by the author of the 'Principles' is generally acknowledged as the only one consistent with a philosophical pursuit of

geological science; and the theologian has admitted the necessity of adapting his opinions to the requirements of correct reasoning and undoubted facts. But whilst Sir Charles Lyell has thus the merit of having placed geology on a true scientific basis, he is at the head of a school of geologists whose views are not so generally accepted.

From a very early period in the history of human intelligence, a notion has been entertained that the various forms of animals and plants, which inhabit or have inhabited the surface of the earth, are modifications of one common form, and that the more complicated have grown out of, or been developed from the simpler forms of animal and vegetable life. In support of this theory the forms of organic beings have been appealed to, and the geologist has thus been made a party to the question. Lamarck and Oken on the Continent, and the anonymous author of the 'Vestiges of the Natural History of Creation' in this country, have supported this view. Sir Charles Lyell not only opposes this theory, but denies that in the history of the strata there is any evidence that the lowest forms of animals were created first. The only fact he admits favouring the hypothesis of development is the late appearance of man on the surface of the earth. Regarding negative evidence as no support to any theory of progress, he sees no reasonable objection to the anticipation that the highest forms of *Mammalia*, except man, should be found in the lowest Silurian rocks. On this question another party has arisen, with Professor Owen and Professor Sedgwick at their head, who, whilst repudiating the development theory, and believing in the special creation of specific forms, yet hold that the species first created were lower in the scale of organisation than those subsequently created, and that during the changes to which the earth has been subjected in its past history, it has been gradually fitted for a succession of organisms, each group of which presents a higher type of organisation than those which preceded it. This question is occupying the minds of the most distinguished palæontologists of the present day.

Sir Charles Lyell has twice visited the United States of America, and delivered courses of lectures before the scientific institutions of that country. His chief aim however has been to examine the geology of the new world. His papers on this subject are very numerous and important, and are as follows:—'On the Carboniferous and Older Rocks of Pennsylvania;' 'On the Stigmara Clay in the Blossberg Coal Field, Pennsylvania;' 'On the Recession of the Falls of Niagara;' 'On the Tertiary Formations, and their connection with the Chalk in Virginia, and other parts of the United States;' 'On the Fossil Footprints of Birds, and Impressions of Rain-drops in the Valley of the Connecticut;' 'On the Ridges, Elevated Beaches, Inland Cliffs, and Boulder Formations of the Canadian Lakes and Valley of St. Lawrence;' 'On the Tertiary Strata of the Island of Martha's Vineyard in Massachusetts;' 'On the Geological position of the Mastodon Giganteum, and associated fossil remains at Bigbone Lick, Kentucky, and other localities in the United States and Canada;' 'On the upright Fossil Trees found at different levels in the Coal Strata of Cumberland, Nova Scotia;' 'On the Coal Formations of Nova Scotia, and on the age and relative position of the Gypsum and accompanying Marine Limestone;' 'On the Cretaceous Strata of New Jersey, and other parts of the United States bordering the Atlantic;' 'On the probable Age and Origin of a bed of Plumbago and Anthracite occurring in Mica Schist, near Worcester, Massachusetts;' 'On the Miocene Tertiary Strata of Maryland, Virginia, and of North and South Carolina;' 'On the White Limestone, and other Eocene or Older Tertiary Formations of Virginia, South Carolina, and Georgia;' 'On the Coal Fields of Tuscaloosa, Alabama;' 'On the evidence of Fossil Footprints of a quadruped allied to the Cheirotherium in the Coal Strata of Pennsylvania;' 'Observations on the Fossil Plants of the Coal Field of Tuscaloosa, Alabama, with a description of some species by C. L. F. Bunbury;' 'On the Delta and Alluvial Deposits of the Mississippi, and other points in the Geology of North America, observed in the years 1845-46;' 'On the Coal Fields of Alabama;' 'On the Newer Deposits of the Southern States of North America;' 'On the Footmarks discovered in the Coal Measures of Pennsylvania;' 'On the Structure and probable age of the Coal Field of the James River, near Richmond, Virginia;' 'On the Relative Age and Position of the so-called Nummulite Limestone of Alabama.' These papers were published in the 'Proceedings' and 'Transactions' of the Geological Society, 'Reports of the British Association,' and 'Silliman's Journal of American Science.'

In addition to this series of papers Sir Charles has published two works giving an account of his travels in America. The first appeared in 1841, and was entitled 'Travels in North America, with Geological Observations on the United States, Canada, and Nova Scotia,' 2 vols. 8vo, with a geological map. These volumes contain an account of personal incident, as well as popular descriptions of the geology of the district visited. In these volumes he describes the educational institutions of America, and strongly insists on their superiority to our own similar institutions, on account of the extensive cultivation of the natural sciences. In his second journey he more particularly visited the southern states, and records in his work his personal adventures together with an account of the geology of the districts through which he passed. This work is entitled 'A Second Visit to the United States,' and was published in 1845.

Previous to his journeys to America he had travelled on the Conti-

ment of Europe, and made himself acquainted with the most prominent points of its geology; and numerous papers in the 'Transactions' of the Geological and other Societies testify to the diligence and acumen with which he has prosecuted the subject of his researches. In these papers he has more especially illustrated the great Tertiary beds of Europe, to which he has all his life devoted more or less attention, and by his labours principally, given the definite character which these formations assume in the history of the earth's surface. It would be almost impossible to point out the particular discoveries to which Sir Charles may lay claim in these papers, but they constitute a mass of facts and conclusions on which much of the present science of geology rests.

Sir Charles Lyell is one of the most active members of the British Association for the Advancement of Science, and has filled almost every office, with the exception of that of president—a post which he will undoubtedly soon be invited to fill. Many of his papers are published in the 'Transactions' of this body, and his presence has always added to the interest with which the proceedings of the geological section of this association have ever been regarded.

Sir Charles was married to the eldest daughter of Leonard Horner, Esq., in 1832. In 1836 he was elected President of the Geological Society, and again in 1850. He received the honour of knighthood on account of his scientific labours, in 1848, and in 1855 the University of Oxford, his Alma Mater, honoured itself by conferring on him the title of D.C.L.

LYLY, LILY, or LILLY, JOHN, was a native of the Weald of Kent. His birth has been referred to the year 1554, on the faith of the entry of his matriculation as a student at Oxford in 1571, which asserts him to have then been seventeen years old. He became Bachelor of Arts in 1573. It appears from one of his prefaces that he was rusticated from Oxford; and, after having (it is said) studied likewise at Cambridge, he went to London, and spent his life in literary labour, as a dramatic and miscellaneous writer. Although his writings must for a considerable time have been fashionable at court, he appears to have shared to the full in the poverty and distresses of authorship. He is supposed to have served Lord Oxford, but to have been deprived of his place; and he was long and unsuccessfully an applicant for the office of master of the revels. In one of his petitions to the queen, which has been preserved, he, with melancholy quaintness, describes the history of his life as "Lyly *De Tristibus*, wherein shall be seen patience, labours, and misfortunes." The time of his death is unknown; but he must have survived the beginning of the 17th century.

The two most famous of his works bore the following titles: 'Euphuus: the Anatomy of Wit, verie pleasant for all gentlemen to read, and most necessary to remember: wherein are contained the delights that Wit followeth in his youth by the pleasantness of Love, and the happiness he reapeth in age by the perfectnesse of Wisedome,' 4to, 1579 or 1580: 'Euphuus and his England; containing his voyage and adventures, mixed with sundrie pretie discourses of honest Love, the description of the Countrey, the Court, and the manners of that Isle; delightful to be read, and nothing hurtfull to be regarded; wherein there is small offence by lightnesse given to the wise, and lesse occasion of loosenesse proffered to the wanton,' 4to, 1582. He wrote also a lively satirical tract against Martin Marprelate: 'Pap with a Hatchet; alias, a Fig for my Godson; or Crack me this Nut; or a Country Cuff; that is, a sound Box on the Ear for the Idiot Martin to hold his peace: written by one that dares call a Dog a Dog,' 1593. He was also the author of nine plays still extant: 1, 'Alexander and Campaspe,' 1584, 1591; reprinted in Dodsley's 'Collection,' vol. ii. 2, 'Sapho and Phao,' 1584, 1591. 3, 'Endimion,' 1591; reprinted in Dilke's 'Old Plays,' vol. ii. 4, 'Galathea,' 1592. 5, 'Midas,' 1592; and 6, 'Mother Bombe,' 1594, 1597; both reprinted in Dilke's 'Collection,' vol. i. 7, 'The Woman in the Moon,' 1597. 8, 'The Maid's Metamorphosis,' anonymous, but generally attributed to Lyly, 1600. 9, 'Love's Metamorphosis,' 1601; the authorship of which has been doubted.

The first mentioned works of Lyly gave the name of 'Euphuism' to a fashionable style of language, of which, although he certainly did not invent it, he was the most eminent literary cultivator. The 'Euphuism' of Lyly himself was just an exaggerated form of that strained, pedantic, over-elaborated imagery which was prevalent in refined society as well as in literature about the middle of Elizabeth's reign. In his hands it added to the classical pedantry of the day a pedantry of something like science, consisting in incessant images derived from a half-fabulous system of natural history. Shakspeare's Don Armado has sometimes been considered as 'parleying Euphuism;' but, as Mr. Knight has observed, there is a nearer approach to this jargon in much of the language used by the higher personages in the same play. The absurdities of it are burlesqued by Jonson in his 'Cynthia's Revels.' Sir Piercie Shafton, in 'The Monastery,' is an unsuccessful attempt at representing the characteristics of Euphuism.

Lyly's dramas are almost everywhere deformed by the same false taste; yet they exhibit occasional touches of fine fancy, which however is shown to greater advantage in some of the short lyrical pieces interspersed through them. The wit of the dialogue is in some places lively. To success in portraiture of character these plays can make no claim; and as little can their mythological, pastoral or

classical stories be said to possess dramatic interest, or to be treated with dramatic skill. The author's claim to remembrance as a dramatist rests almost wholly on his position as one of Shakspeare's immediate predecessors; and on the fact that his plays present, in strong relief, some of the distinctive characteristics of the literary tastes which prevailed in that interesting age.

* LYNDHURST, JOHN SINGLETON COPLEY, LORD, is the only son of the eminent painter, John Singleton Copley. [COPLEY, vol. ii. col. 382.] His parents having emigrated from Ireland to America, the future Lord Lyndhurst first saw the light at Boston, in the United States, on the 21st of May 1772. He was about two years old when he was brought over to England by his father, and the education which he received in his youth was from a private tutor. At the usual age he was entered a pensioner of Trinity College, Cambridge, of which he was soon afterwards elected scholar. In the Mathematical Tripos of 1794 Mr. Copley took his degree of B.A., as second wrangler and senior Smith's prizeman, dividing the highest honours of the university with the late Dr. Butler, head master of Harrow School and dean of Peterborough. Soon afterwards he was elected a Fellow of his college, and his additional appointment as a 'Travelling Bachelor' gave him an opportunity of visiting the United States and the continent of North America.

Having entered himself at the Temple on his return to England, he commenced a diligent and laborious course of study, and was called to the bar in 1797. He went for a time the Midland circuit, but it was long before he gained any great eminence or extensive practice. He was first brought into public notice by a report of 'the Case of a Double Return for the Borough of Pershore,' which he published in 1808. Time and the ordinary changes which made vacancies in his profession gradually enlarged his practice, and gave scope to the development of his talents as an advocate. By degrees he obtained the undoubted leadership of his circuit; but it was not until the trial of Watson and Thistlewood for high treason, in 1817, in which he was engaged to assist the late Sir Charles Wetherell in defence of the prisoners, that he had an opportunity of displaying his abilities on any occasion of great public interest. Up to this period Mr. Copley's politics were decidedly liberal. He had exhibited however so much address and ability, that the Tory party resolved if possible to press him into their service. Accordingly, at the close of the year 1817, we find him employed as counsel for the crown in the prosecution of Brandreth and his associates, who were executed for high treason. In 1818 Mr. Copley made his first step towards substantial promotion, being advanced to the post of chief-justice of the County Palatine of Chester; and about the same time he entered Parliament as member for the since disfranchised borough of Yarmouth, in the Isle of Wight. In Hilary Term 1819 he was made a king's serjeant and quitted his circuit; and in the course of the same year succeeded Sir Robert (afterwards Lord) Gifford as Solicitor-General, when he received the honour of knighthood. In 1820 he took an active part, as solicitor-general, in conducting the prosecution of his former client for the Cato-street conspiracy, and in the proceedings instituted before the House of Lords against Queen Caroline, which he conducted with so much moderation and skill that he escaped from the general discredit which that prosecution brought on all persons who were concerned in it.

In 1824 on the elevation of Sir Robert Gifford to the mastership of the rolls, Sir John Copley became Attorney-General, and at the general election of 1826 he was returned as member for Cambridge University, in conjunction with Viscount Palmerston. In the same year the death of Lord Gifford caused a vacancy in the Rolls Court, to which he succeeded. In 1827 the question of Roman Catholic Emancipation was brought forward in the House of Commons, during the struggle for power between various political parties, owing to the illness of Lord Liverpool. The bill on this occasion was strenuously opposed by the Master of the Rolls, though he had advocated it in an earlier stage of his political career, and though he took office a few weeks subsequently under Mr. Canning, when he attempted to form a ministry on liberal principles. On that occasion he was offered and accepted the chancellorship, somewhat to the surprise of the public, and on the 27th of April in that year he was raised to the peerage as Baron Lyndhurst of Lyndhurst, county of Hants.

Lord Lyndhurst continued to act in harmony with Mr. Canning until the death of that statesman in the following month of August, and even advocated a relaxation of the laws affecting Unitarian marriages. He retained office during Lord Goderich's ministry. He is supposed however to have been in some measure instrumental in breaking up that ill-assorted and inefficient administration; and, on the Duke of Wellington forming the succeeding government, Lord Lyndhurst retained his office. In the various vacillating, though useful concessions of that ministry, he bore a prominent part. In 1828 he supported the repeal of the Test and Corporation Acts in opposition to Lord Eldon. In the same year he opposed Roman Catholic Emancipation; but in the following year he, with the rest of the ministry, supported a full and ample measure of Emancipation, declaring that he "felt no apprehension for the safety of the church."

Lord Lyndhurst's official career was marked by few oratorical displays. He introduced and carried some useful measures of Law Reform; but was defeated in his attempt to create an additional

chancery judge. On the 15th of November 1830 (the very day on which the decision on Sir Henry Parnell's motion on the Civil List gave the ministry, of which he was a member, its mortal blow), he introduced a bill for regulating the Regency, in case of the demise of the king during the minority of his successor. This bill was adopted and carried by Lord Grey; and it is a singular proof of the soundness of this bill, of the skill with which it had been prepared, and of the very full and lucid manner in which its provisions were explained by Lord Lyndhurst, that after this speech not the slightest discussion took place on either the principle or the details of an arrangement, which had never before been settled without prolonged debate, and the fiercest strife of parties.

Having been bred to the common-law bar, it was some time before Lord Lyndhurst attained a perfect knowledge of that particular branch of law which he was called upon to administer in the Court of Chancery; and in spite of his vigour of intellect, his fairness of mind, and his natural acuteness, he certainly did not establish for himself so high a judicial character as he has since obtained. Lord Lyndhurst retired from office with the Duke of Wellington in November 1830; but he had so far conciliated the respect and esteem of the liberal party that he was made by them, shortly after their accession to power, Chief Baron of the Exchequer; and it was in this post that he earned that high reputation as a judge which he has ever since retained. Overcoming his natural tendency to indolence, he won his way with the bar by his uniform courtesy and fairness, and with the public by his integrity and impartiality. Decided and self-reliant almost to a fault, his great qualities were exhibited to advantage in guiding the proceedings of the court over which he presided; and the efficiency of his administration of justice is proved by the fact that, during his tenure of the judicial dignity, the Court of Exchequer, from having comparatively little business to transact, became the most busily occupied of all, and its decisions were considered of greater weight than those of the King's Bench itself.

Whilst presiding in the Exchequer (from 1831 to 1834) Lord Lyndhurst took little or no part in the proceedings of the Upper House except upon the introduction of the Reform Bill, to which he offered a very strenuous and persevering opposition. His able speech against the second reading of the bill placed him at the head of the Conservative party in the House of Lords. On the 7th of May 1832 he proposed and carried a postponement of the clauses which disfranchised the rotten boroughs. The ministry of Earl Grey resigned office; and the formation of a new ministry, on Tory principles, was actually proposed to Lord Lyndhurst and accepted by him, in conjunction with the Duke of Wellington, but speedily abandoned on account of the refusal of Sir Robert Peel and other moderate Conservatives to lend him their co-operation. Accordingly Earl Grey resumed office, and the Reform Bill passed into law.

During the next three years Lord Lyndhurst took little or no part in any questions except those of a legal and technical nature. He carried a bill for settling the litigations arising out of the will of Mr. Thellusson, and lent his aid to the defeat of Lord Brougham's bill for the establishment of local courts. In November 1834 Lord Melbourne's resignation of office occurred, and Lord Lyndhurst accepted the Great Seal under the brief administration of Sir Robert Peel which followed, but his official career during these months is in no way distinguishable from that of the ministry of which he was a member. The struggle between the contending parties was chiefly in the House of Commons, and Lord Lyndhurst found little exercise for his abilities in the Lords. On the retirement of his party however he devoted his entire energies to politics, with the exception of a rare attendance to his judicial duties in the House of Peers and the Privy Council. In the latter part of the session of 1835 he took the lead in opposing the Bill for the Reform of Municipal Corporations, and succeeded in inducing the House of Lords to insert in it certain amendments which were thought to be fatal to the bill. Experience proved that Lord Lyndhurst and his party had not calculated correctly; for the amendments, when adopted, rendered it more hurtful to the Tory party than it would have been in its original form. In the following year he took up a still more marked position in the House of Lords, whom he stimulated, while in opposition, to adopt a less conciliatory course than that which approved itself to moderate partisans such as Sir Robert Peel and the Duke of Wellington. At the same time he commenced the plan of delivering at the end of each parliamentary session a speech in which he gave a resumé of its proceedings, accompanied by a sarcastic and withering commentary on the smallness of ministerial results. During this time he also gained considerable notoriety by his keen attacks on the Roman Catholics of Ireland, whom he designated as "aliens in blood, in language, and in religion."

Upon the accession of Sir Robert Peel to power in 1841, Lord Lyndhurst for the third time undertook the duties of the chancellorship, which he held until the dissolution of the Conservative party, and the retirement of Sir Robert Peel in 1846. He has continued down to the present time to take an occasional part in the debates of the House of Lords. He warmly and cordially supported the ministry of the Earl of Derby in 1852, and since that time advocated the undertaking of the war with Russia, and in some speeches which produced a profound impression throughout the country counselled perseverance in carrying it to a successful issue. When peace was made at Paris in March 1856,

he denounced the policy adopted by Lord Clarendon as a practical capitulation on the part of England. He was, and, in spite of the infirmities of age, he still is, one of the most effective of parliamentary speakers in either house. His style of oratory is captivating in the extreme, being classical and severely simple, owing much of its charm to the very absence of ornament, though all his speeches show marks of careful preparation. His voice is one of the most beautiful, and his articulation perfect, being distinct and melodious, without the least appearance of effort, and with a clear and silvery tone which gains the ear by the manner, even if the reason is not always satisfied with the matter of his speeches. His allusions to classical literature, which are not unfrequent, are always in good taste and applicable to the subject; and the structure of his sentences is so correct and elegant that it is said they might be printed straight from his lips without needing correction. His speeches on the Cambridge University Reform, delivered in 1855, those on the Wensleydale Peerage in February 1856, and others still more recently delivered on the state of Italy, and on moving the Oath of Abjuration Bill, may be ranked among the highest of oratorical displays. As Speaker of the House of Lords he was remarkable for an easy carelessness and a disregard of the formalities of his position, which showed in him an indifference to ceremony not frequently found in those who have risen to the peerage from the ranks of the people.

* LYONS, EDMUND, LORD, better known as ADMIRAL SIR EDMUND LYONS, G.C.B., is the second son of the late John Lyons, Esq., of Burton House, near Christchurch, Hants, where he was born on the 21st of November 1790. At an early age he was sent to Hyde Abbey School, near Winchester, then under Dr. Richards, who numbered among his pupils George Canning, Dean Gaisford, and Wolfe, the author of the celebrated 'Ode on the Burial of Sir John Moore.' In June 1801 he entered the service of the navy under the late Admiral Sir Harry Burrard Neale, on board H.M.S. the Royal Charlotte, whence, in the following year, he was transferred to the Maidstone, Captain R. Moubay. In 1807 he served under the late Sir J. T. Duckworth in the Dardanelles, on board the Active, and was engaged in the successful attack on the redoubt of Point Pesquies, on the Adriatic shore. In November 1809 he became lieutenant of the Barracouta brig; and in the following year he formed one of the storming party who attacked by night the castle of Belgica, in the island of Banda Neira, and by a gallant exploit added another Dutch to the British possessions in the Indian Sea. In 1811 he stormed and captured the strong fortress of Marrack, on the coast of Java, but was forced to return home to England to recruit his health. In 1813 he was appointed to the Rinaldo, in which vessel he conveyed Louis XVIII. to France, and brought the allied sovereigns back to England. He obtained post rank in 1814, but was not actively employed between that date and 1828, when, in command of the Blonde, he took part in blockading Navarino, and superintended the naval expedition sent to aid the French in their investment of the castle of Morea, the last hold of the sultan in the Peloponnesus. On this occasion he is reported to have served in the trenches without intermission for twelve days and nights; and on the cessation of hostilities, his courteous bearing, professional skill, and unflinching bravery were rewarded by the orders of St. Louis of France and the Redeemer of Greece. In 1829 he was employed to convey Sir R. Gordon, the British ambassador to Constantinople, in the Blonde; and in the year 1831 he took the late Sir John Malcolm as far as Alexandria on his route to Persia. It is not a little singular that Captain Lyons's ship, the Blonde, should have been the first British vessel of war that ever entered the Black Sea, and that in her he should have visited both Odessa and Sebastopol upwards of twenty years before the breaking out of the recent war against Russia. In 1832, while commanding the Madagascar, he was an eye-witness of the bombardment of Acre by Ibrahim Pasha; in the following year he escorted King Otho and the Bavarian embassy from Trieste to Athens, in order to assume the kingdom of Greece.

Having paid off the Madagascar in the early part of 1835, he received the honour of knighthood from King William IV., and soon afterwards was appointed minister plenipotentiary and ambassador extraordinary at the court of Athens. The duties of this post he continued to discharge with great ability and discretion for upwards of fourteen years, but resigned it in February 1849 on becoming ambassador to the Swiss cantons, whence he was transferred in 1851 in order to fill the same high post at the court of Stockholm. The latter appointment he resigned towards the close of 1853, when a rupture with Russia had become imminent. On the breaking out of the Russian war, Sir E. Lyons took the post of second in command in the Black Sea, under Admiral Sir J. W. Deans-Dundas, on whose resignation in June 1855 he became commander-in-chief of the Black Sea fleet. The transport of the English troops from Varna to the Crimea, in September 1854, was executed under the direction of Sir E. Lyons without the loss of a single man. At the battle of the Alma (September 20th) he supported the French army ashore by bringing the guns of his ship, the Agamemnon, to bear upon the left flank of the Russians; and he was an eye-witness of the engagements at Balaklava and Inkermann (October and November), though, as a naval officer, he could take no part in them. He planned the expedition against the Russian forts along the Sea of Azoff (May and June 1855),

which was gallantly executed by his son, Captain Moubray Lyons, of the *Miranda*, who died soon afterwards at Therapia from the effects of a wound received off Sebastopol. In the last and successful assault on that city (September 1855), Sir E. Lyons was prevented by a strong gale of wind from bringing his fleet into action and taking a part in the success of the day. On his return to England he was met with the warmest welcome: he was presented with the freedom of the city of London, and received the thanks of both Houses of Parliament for his services in the Black Sea; and in June 1856 was elevated to the peerage as Baron Lyons of Christchurch, co. Hants. By his wife Augusta, daughter of the late Captain Josias Rogers, R.N., and who died at Stockholm in 1852, Lord Lyons has an only surviving son, attaché to the embassy at Florence, and now British Resident at Rome.

LYSANDER, a Spartan, who rose to eminence towards the end of the Peloponnesian war, and was placed in command of the Lacedæmonian troops on the coast of Asia Minor, B.C. 407. Having about him little of the old Spartan severity, and being ready to sacrifice that personal and national pride and inflexibility, which were the peculiar characteristic of the Spartan institutions, to personal or national interests, he gained in an unusual degree the regard and confidence of his Persian allies. This he used to the best advantage, by seizing a favourable moment to obtain from the younger Cyrus, the Persian viceroy in Asia Minor, in place of any personal advantage, the addition of an obolus daily (rather more than a penny) to every seaman in the Peloponnesian fleet. During his year's command he defeated the Athenian fleet, commanded by Antiochus, as lieutenant of Alcibiades, at Notium. In September B.C. 406, he was superseded by Callicratidas; who was defeated and slain in the memorable battle of Arginusæ. The allies then petitioned that Lysander might be re-appointed. It was contrary to Spartan law to entrust the fleet twice to the same person; but this difficulty was evaded by nominating another person commander-in-chief, and sending Lysander as lieutenant with the command in Asia. He soon justified the preference, by gaining the decisive victory of Ægospotami, in the Hellespont, where 170 Athenian ships were taken. This in effect finished the war. Receiving as he went the submission of her allies, Lysander proceeded leisurely to Athens, and blockaded the ports, while the Spartan kings marched into Attica and invested the city, which, unassaulted, was reduced by the sure process of famine. The capitulation being settled, B.C. 404, Lysander had the proud satisfaction of entering as a victor the Piræus, unviolated by the presence of an enemy since the Persian invasion.

His services and reputation gained for him a corresponding weight in Sparta; and on occasion of the contested succession his influence was powerful in raising Agesilaus to the throne. He accompanied that eminent statesman and soldier during his first campaign in Asia, where his popularity and renown threw his superior into the shade; and an estrangement resulted, in which Lysander behaved with temper and wisdom. About B.C. 396 he returned to Sparta. In the following year, on occasion of a quarrel with Thebes, he was sent into Phocis, to collect contingents from the northern allies—a task for which his name and popularity rendered him peculiarly fit. Having done this, and being on his way to join the Lacedæmonian army, he was taken by surprise, and slain by the Thebans at Haliartus in Bœotia. The force which he had collected dispersed; and the war came at once to an end, with no credit to the Lacedæmonians, B.C. 395.

It is said that, urged by ambitious hopes, he meditated a scheme for abolishing the hereditary right of the descendants of Hercules, and rendering the Spartan throne elective, and that he had tampered largely with different oracles to promote this scheme. The contemporary Xenophon however makes no mention of this rumour. This subject has been discussed by Mr. Thirlwall in an appendix to his fourth volume of the *'History of Greece.'* [ALCIBIADES; AGESILAUS.]

LYSIAS, one of the ten Athenian orators, was born at Athens, B.C. 458. His father Cephalus was a native of Syracuse, who settled at Athens during the time of Pericles; he was a person of considerable wealth, and lived on intimate terms with Pericles and Socrates. His house is the supposed scene of the celebrated dialogues of Plato's *'Republic.'*

Lysias, at the age of fifteen, went to Thurium in Italy, with his brother Polemarchus, at the first foundation of the colony. Here he remained for thirty-two years; but in consequence of his supporting the Athenian interests, he was obliged to leave Italy after the failure of the Athenian expedition in Sicily. He returned to Athens B.C. 411, and carried on, in partnership with his brother Polemarchus, an extensive manufactory of shields, in which they employed as many as 120 slaves. Their wealth excited the cupidity of the Thirty Tyrants; their house was attacked one evening by an armed force, while Lysias was entertaining a few friends at supper; their property was seized, and Polemarchus was taken to prison, where he was shortly after executed (B.C. 404). Lysias, by bribing some of the soldiers, escaped to the Piræus, and sailed from thence to Megara. He has given us a graphic account of his escape in his oration against Eratosthenes, who had been one of the Thirty Tyrants. Lysias actively assisted Thrasybulus in his enterprise against the Thirty; he supplied him with a large sum of money from his own resources and those of his friends, and hired a considerable body of soldiers at his own expense.

In return for these services Thrasybulus proposed a decree, by which the right of citizenship should be conferred upon Lysias; but in consequence of some informality this decree was never carried into effect. He was however allowed the peculiar privileges which were sometimes granted to resident aliens. Lysias appears to have died about B.C. 378.

The author of the life of Lysias, attributed to Plutarch, mentions four hundred and twenty-five orations of Lysias; two hundred and thirty of which were allowed to be genuine. At present there are thirty-five extant, attributed to this orator, as well as a few fragments of fifty-three others. But some of these may not be genuine; and at least the *'Epitaphius'* bears strong internal evidence of being by another hand. Dionysius of Halicarnassus has written a laboured essay on the style and merits of Lysias. He allows him almost every excellence except those of sublimity and the power of strongly moving the passions. "His style," he observes, "is not so well adapted to show the power of art as to represent the truth of nature." In narrating events or circumstances, Dionysius considers him as superior to all the orators, and as the rule and model in this department of the art. The *'Apology for the death of Eratosthenes'* is a pattern of simple and perspicuous narration.

According to Suidas and other ancient biographers, Lysias also wrote some treatises on the art of oratory (which he is said by Cicero, *'Brut.'* c. 12, to have taught), and discourses on love. There is still extant a treatise on love, which bears the name of Lysias, and which has been edited by Henish, Leip., 1827, but this work evidently belongs to a much later period in Greek literature.

The best edition of the text of Lysias is by Bekker. Useful editions have also been published by Taylor, 1738; by Foertsch, 1829; and by Franz, 1831. Lysias has been translated into French by Auger, Paris, 1783, and into English by Gillies, together with the orations of Isocrates, London, 1778.

(Dionysius of Halicarnassus; *Life of Lysias*, attributed to Plutarch; Photius, C., 261; *Life of Lysias*, prefixed to Taylor's edition.)

LYSIMACHUS, one of the officers of Alexander the Great, was born of an illustrious Macedonian family. (*'Justin,'* xv. 3.) In the general distribution of the provinces, or satrapies, to the chief Macedonian officers after the death of Alexander, Lysimachus received Thrace and the neighbouring countries. It was not however without difficulty that he obtained possession of the province which had been assigned to him; he was vigorously opposed by Seuthes, king of Thrace, and other native princes, and it was some time before his power was firmly established in the country. In B.C. 314 he joined Cassander, Ptolemy, and Seleucus in their endeavour to check the power of Antigonus [ANTIGONUS]; but he does not appear to have been able to take an active part against Antigonus, in consequence of the revolt of many Thracian tribes who had been excited by Antigonus to make war against him. The peace, which was made between the contending parties B.C. 311, lasted only for a short time; and the war was continued with various success till the conquests of Demetrius, the son of Antigonus, in Greece, roused the confederates to make more vigorous exertions; and Lysimachus was accordingly sent into Asia Minor, B.C. 302, where he took several places, and acquired immense plunder. Antigonus hastened to meet him, but could not force him to a battle. In the following year Lysimachus, having formed a junction with the forces of Seleucus, met Antigonus at Ipsus in Phrygia, where a bloody battle was fought, in which Antigonus was killed and his army entirely defeated.

The dominions of Antigonus were divided among the conquerors, and Lysimachus obtained the north-western part of Asia Minor. He shortly afterwards married Arsinoe, the sister of Ptolemaus, king of Egypt, although his eldest son Agathocles had already married Lysandra, the half-sister of Arsinoe. In B.C. 286 he obtained possession of the throne of Macedon and obliged Pyrrhus, king of Epirus, who had

Coin of Lysimachus.

British Museum. Actual size. Silver.

laid claims to the kingdom, to retire to his native dominions. Hitherto the career of Lysimachus appears to have been fortunate, but the latter part of his life was embittered by family dissensions and intestine commotions. Arsinoe, fearful lest her children should be exposed after the death of her husband to the violence of Agathocles, persuaded Lysimachus to put him to death. Agathocles had been an able and successful general; he was a great favourite with the people, who deeply resented his death; and Lysimachus found himself involved in

almost open war with his subjects. Lysandra, the widow of Agathocles, fled to Babylon, and entreated Seleucus to make war against Lysimachus. The Syrian king was willing enough to take advantage of the troubled state of his rival's kingdom; but Lysimachus, anticipating his intentions, marched into Asia, and fell in a battle with the forces of Seleucus, in the seventieth year of his age, according to Appian ('*Syr.*,' c. 64), and in his seventy-fourth, according to Justin (xvii. 1).

The town of Lysimachia was founded by this monarch on the narrow neck of land which connects the Thracian Chersonese with the mainland; its position was about midway between Pactya and Cardia, from which latter town most of the population were removed by Lysimachus to the new city.

(Diodorus Siculus; Justin; Plutarch, *Life of Demetrius*; Pausanias, i, ca. 9, 10; Droysen, *Geschichte der Nachfolger Alexanders*.)

LYSIPPUS, one of the most celebrated sculptors of antiquity, was born at Sicyon. He was particularly distinguished by his statues in bronze, which are said to have been superior to all other works of a similar kind. He introduced great improvements in his art, by making the head smaller, and giving to the body a more easy and natural position than was usual in the works of his predecessors. Pliny informs us that his statues were admired among other things for the beautiful manner in which the hair was always executed. (Pliny, xxxiv. 8.) Lysippus is placed by Pliny in the 114th Olympiad (a.c. 324), contemporary with his brother Lysistratus, Sthenis, Euphronides, Sostratus, Ion, and Silanion. He is said to have been self-taught, and to have attained his excellence by studying nature alone. His talents were appreciated by his contemporaries; the different cities of Greece were anxious to obtain his works; and Alexander is reported to have said, that no one should paint him but Apelles, and no one represent him in bronze except Lysippus. (Pliny, vii. 37; Cic., '*Ad Div.*' v. 12.) His reputation survived his death; many of his most celebrated works were brought to Rome, in which they were held in so much esteem, that Tiberius is said to have almost excited an insurrection by removing a statue of Lysippus, called Apoxyomenos, from the warm baths, where it had been placed by Agrippa, to his own palace.

Lysippus is said to have executed 610 statues, all of the greatest merit (Pliny, xxxiv. 7); many of which were colossal figures. Pliny, Pausanias, Strabo, and Vitruvius have preserved long lists of his works; of which the most celebrated appear to have been—various statues of Alexander executed at different periods of his life; a group of equestrian statues of those Greeks who fell at the battle of the Granicus; the Sun drawn in a chariot by four horses at Rhodes; a colossal statue at Tarentum; a statue of Hercules, at Alyzia in Acarnania, which was afterwards removed to Rome; and a statue of Opportunity (*Kairos*), represented as a youth with wings on his ankles on the point of flying from the earth.

Among the numerous pupils of Lysippus, the most celebrated was Chares, who executed the colossal figure at Rhodes.

(Pliny, *Historia Naturalis*; Pausanias; Junius, *De Pictura Veterum*, p. 109-16.)

LYSONS, REV. DANIEL, M.A., was the eldest son of the Rev. Samuel Lysons, rector of Rodmarton in Gloucestershire, a family living, to which he succeeded in 1804, and resigned to his son in 1833. He was educated at Gloucester, and at St. Mary's Hall, Oxford, at which university he attained the degree of M.A. in 1785. About 1790, while serving the curacy of Putney, he commenced his first topographical work, '*The Environs of London*,' having been encouraged to the undertaking by Horace Walpole, then earl of Orford. The first volume of this work was published in 4to in 1792, and was completed in 1796 by the publication of the fourth; they contained the parishes within a circuit of 12 miles of the metropolis, and an additional volume issued in 1800 completed the remaining parishes in the county of Middlesex. A second edition was published in 1811. In 1806 appeared the first volume of his great work, undertaken in conjunction with his brother Samuel, the '*Magna Britannia*.' The work was issued in separate volumes at irregular intervals till 1822, when, in the order of alphabetical arrangement, it had comprised the counties as far as Devonshire. Mr. Lysons also published a sermon or two, and a '*History of the Origin and Progress of the Meeting of the three Choirs of Gloucester, Worcester, and Hereford*;' but his fame rests entirely upon his topographical works, which are excellent for their laborious research, accuracy of description, and useful record of matters, which would have been otherwise most probably irrecoverably lost. Mr. Lysons died on the 3rd of January 1834. The whole of his topographical collections for the '*Magna Britannia*' were presented by him to the British Museum; they are contained in 64 vols., and form '*Add. MSS.* 9408-9471.'

LYSONS, SAMUEL, the brother of the above, was born at Rodmarton on the 17th of May 1763. He was educated for the law, and was called to the bar in 1798; but history and antiquities had become more congenial pursuits and his almost exclusive study. In 1789 he had been elected into the Society of Antiquaries, of which he was always an active member, vice-president in 1812, and for eleven years a director. In 1803 he succeeded Mr. Astle as Keeper of the Records in the Tower of London, and he immediately commenced to sort and arrange the documents entrusted to his charge, which had hitherto

been almost totally neglected. In 1806 he joined his brother in producing the '*Magna Britannia*,' and which on Mr. S. Lysons's death, on the 29th of June 1819, his brother had not strength to continue beyond the counties then prepared in whole or in part. Mr. S. Lysons's other works were, '*Roman Remains discovered at Woodchester and Minchinhampton*,' fol., 1797; '*Figures and Descriptions of Mosaic Pavements discovered at Horkstow in Lincolnshire*,' 4to, Lond., 1801; '*Remains of Two Temples and other Roman Antiquities discovered at Bath*,' fol., 1802; '*A Collection of Gloucester Antiquities*,' fol., 1804; and several papers on similar subjects in the '*Archæologia*.' In the '*Gloucester Antiquities*' the drawings and etchings were all from his own hand, as were many of the illustrations of his other works.

DANIEL LYSONS, a physician at Bath, the author of several medical works, who died in 1800, was the uncle of the two writers above mentioned. He has been in some general biographies mis-stated as the father and as the brother of Samuel.

LYTTELTON, GEORGE LORD, born in January 1708-9, the eldest son of Sir Thomas Lyttelton, Bart., of Hagley in Worcestershire, was educated at Eton and Christchurch, Oxford, at both of which his scholastic acquirements and promising talents gained him much credit. After travelling on the Continent for some time, he entered parliament in 1730, connected himself with the leaders of the opposition to Sir Robert Walpole, and acquired eminence and weight as a parliamentary speaker. He was a favourite of Frederic, prince of Wales, at whose court he filled the office of secretary. After Walpole's retirement Lyttelton was made a Lord of the Treasury in 1744. He was raised in 1756 to be Chancellor of the Exchequer, a place for which his qualifications were but limited, if the story be true that he never could comprehend the simplest rule of arithmetic. He resigned that office to Mr. Legge in less than a year, and went out of office altogether on the dissolution of the ministry in 1759; at which time (his father being dead) he was raised to the peerage by the title of Baron Lyttelton of Frankley. The rest of his life was chiefly devoted to literature. He died in 1773.

Lord Lyttelton's literary talents in early life won the affection of Pope. His poetry, though elegant and tasteful, does not rise above mediocrity; it has however gained for him a place in Johnson's '*Lives*.' Of his prose works, the chief are, '*Observations on the Conversion and Apostleship of St. Paul*,' 1747, the result of those studies by which, in middle life, he was converted from scepticism into a sincere and zealous believer in Christianity. This work has enjoyed a high reputation. '*Dialogues of the Dead*,' 1760, a popular and amusing work. '*History of Henry II.*,' to which is prefixed an account of the Revolutions of England, from the death of Edward the Confessor to the birth of Henry II., 1764-67. This is a laborious and respectable work, the fruit of twenty years' research. '*Miscellaneous Works*,' 1774. '*Poetical Works*,' 1785. Lord Lyttelton took a leading part, by his '*Account of a Journey in Wales*,' in opening the eyes of the English to the beauties of their own country; and by the tasteful and expensive improvements in his celebrated park at Hagley introducing the modern practice of landscape gardening.

Lord Lyttelton's private character was exemplary; his acquirements were extensive; his judgment as a politician and man of the world penetrating. But his indolence prevented him from doing justice to his own powers, exposed him to imposition, and led him into some embarrassments. His son, THOMAS LORD LYTTELTON, who died early in 1779, also possessed great abilities, but wasted and debased them in a profligate and unhappy life. Some attention was drawn to him a few years back by an article in the '*Quarterly Review*' (No. 179, January 1852), in which the author laboured with some ingenuity to show that Thomas lord Lyttelton was the author of the '*Letters of Junius*;' but the hypothesis found few adherents even at first, and is now universally abandoned. The reader who may wish to look a little further on this claim, and on what is known of Thomas Lyttelton, will do well to refer to a valuable paper by Sir F. Madden, in '*Notes and Queries*,' vol. viii. p. 31 (July 1853); and further, in vol. xi. p. 198 of the same work.

* LYTTON, SIR EDWARD GEORGE EARLE LYTTON BULWER, BART., was born in 1805, the youngest son of General Bulwer, of Woodalling and Haydon Hall, Norfolk. His mother was Elizabeth Barbara, the only daughter of Richard Warbenton Lytton, Esq., of Knebworth, Herts—a splendid property, which had belonged to the Lytton family from ancient times. By the death of his father, while the future novelist was yet young, the care of his education devolved on his mother, who was a woman of very superior character and intelligence, and who, as the heir of the Knebworth estates, resumed by royal licence (1811) her own name of Lytton. Possessed of great wealth, she spared no expense in the education of her sons. When only six years of age, Edward, the youngest of them, used to delight her by writing verses. In 1820, while only fifteen years of age, he appeared in print as the author of '*Ismael: an Oriental Tale*.' After a careful training under private tutors, he entered Trinity Hall, Cambridge, as a fellow-commoner; and here, while distinguishing himself among the other wealthy young Cantabrigians in all the exploits and amusements of academic life, and while spending his vacations in tours in England, Scotland, and the Continent, he gave ample proof at the same time of his brilliant abilities and his passion

for literature. He graduated B.A. in 1826, which degree was exchanged for the higher one of M.A. conferred on him in 1835. Prior to the first of these degrees however he was professedly an author. In 1825 he published a poem on 'Sculpture,' which had gained the Chancellor's prize for English versification at the university. In 1826, when just leaving his formal studies at the university, he published a collection of his juvenile poems under the title of 'Weeds and Wild Flowers;' which was followed in 1827 by a tale in verse somewhat in the impassioned Byronic style, entitled 'O'Neill, or the Rebel.' In the same year (1827) appeared his first novel, 'Falkland,' an impassioned love-story, published without his name. Having thus plumed his wing, he ventured in 1828 on a somewhat different flight in his 'Pelham, or the Adventures of a Gentleman,' in which wit and lively pictures of modern society were combined with romance and enthusiasm. The novel made a great impression, and was abundantly criticised. Next, in the same year, came another novel, with less of worldly interest and adventure, entitled 'The Disowned,' and which, though successful, was not so successful as its predecessor; and next, in 1829, 'Devereux,' a powerful work of fiction. In the year 1830, Mr. Bulwer, whose literary reputation was by this time fully established, produced another novel, called 'Paul Clifford,' the peculiarity of which was that the hero was a highwayman, the better parts of whose nature were developed by the influence of love. In this, as well as in the preceding novels, there was an abundance of satirical allusion to the vices and foibles of society; and the same satirical spirit was more expressly manifested in a poem entitled 'The Siamese Twins,' published in 1831.

It was in this year that Mr. Bulwer, then about twenty-six years of age, commenced his parliamentary career as member for St. Ives. It was the time of the Reform Bill agitation, and Mr. Bulwer attached himself ardently to the reform party. In 1832 he was returned to the reformed parliament as member for Lincoln, which seat he continued to hold till 1841, still as an adherent of the Whigs, or rather of that extreme party of the Whigs which had assumed the name of Radicals. As an adherent of this party he took a strong interest in, and spoke frequently and with effect on, liberal measures—more especially on questions, such as that of the newspaper stamp, affecting the free diffusion of knowledge.

Meanwhile, Mr. Bulwer was none the less assiduous as an author. In 1831—his first year in parliament—he published his celebrated novel of 'Eugene Aram;' and in the same, or in the following year, he succeeded Campbell in the editorship of the 'New Monthly Magazine.' To the pages of this periodical he contributed a series of papers, afterwards collected and republished (1835), in two volumes, under the title of 'The Student.' In 1833 he published his 'England and the English,' a series of witty and sarcastic sketches of English society, English literature, &c. This work provoked some severe criticism. It was followed in 1834 by his 'Pilgrims of the Rhine,' an illustrated book; and that again, almost immediately, by his powerful and glowing romance entitled 'The Last Days of Pompeii,' for the composition of which he had been prepared by a recent tour in Italy. Another novel, also full of Italian descriptions and historical portraiture of men and manners, though referring to a more modern epoch, was the splendid story of 'Rienzi,' the Roman tribune of the middle ages. Almost contemporaneous with this work of fiction was a political pamphlet entitled 'The Crisis,' published in 1835, during the brief interruption of the Whig government by the Conservative ministry of Sir Robert Peel. The pamphlet ran through many editions; several answers were published to it; and altogether its effect was such that its author (the importance of his political services being added to his literary reputation) was raised to a baronetcy by the Melbourne administration.

About this time, Sir Lytton, sated with his success as a novelist, broke new ground in a five-act play, 'The Duchess of La Vallière,' which was acted in 1836, but was on the whole a dramatic failure. In 1837, returning to the novel, he published 'Ernest Maltravers;' a continuation of which, entitled 'Alice, or the Mysteries,' subsequently appeared. In the same year he published a book of classical research and disquisition in two volumes, entitled 'Athens: its Rise and Fall; with Views of the Literature, &c., of the Athenian People;' a work some of the materials for which he had collected while at Cambridge. In 1838 appeared 'Leila, or the Siege of Granada,' and 'Calderon the Courtier,' works of fiction of a lighter order. Meantime, nothing daunted by his former ill success in the drama, Sir Lytton had returned to the same literary field, and produced in succession two five-act plays, 'The Lady of Lyons, or Love and Pride;' and 'Richelieu, or the Conspiracy,' both of which had a great success, and both of which retain their hold on the stage as among the most popular of our modern acting-plays. Passing over a series of works of fiction and description entitled 'Night and Morning,' 'Day and Night,' 'Lights and Shadows,' and 'Glimmer and Gloom,' we come to Sir Edward's next important novel, his 'Zanoni,' a tale of the supernatural and the magical, published in 1842. In the same year Sir Edward, still ambitious of the fame of a poet as well as of a novelist, gave to the world 'Eva, the Ill-Omened Marriage;' and other Tales and Poems.' Subsequent poetical compositions were 'The New Timon' (1846) and 'King Arthur' (1848), both of which were published anonymously, in order that pre-conceptions of the author might not interfere with the

public appreciation of their merits as poems, but which (the public easily detecting the authorship) were eventually acknowledged. As a poet however, except in the drama, Sir Edward has never taken so high a place in critical estimation as he has done as a novelist. In this walk his powers seem inexhaustible; his latest novels—'The Last of the Barons,' 'Harold, or the Last of the Saxon Kings,' 'Lucretia, or the Children of Night,' 'The Caxtons,' and 'My Novel, or Varieties of English Life'—having, each and all, been as eagerly received as any of their predecessors. The last two, differing from most of their predecessors in being novels of English domestic life, appeared originally in 'Blackwood's Magazine,' where also appeared a series of translations from the 'Poems and Ballads of Schiller,' republished collectively in 1844.

It was in 1844 that Bulwer, succeeding by his mother's death to the estates of Knebworth, &c. (worth, it is said, 12,000*l.* a year), exchanged by royal licence the surname of 'Bulwer,' which he had hitherto borne, for that of 'Bulwer Lytton,' which he now bears. At the date of this accession to his wealth and social influence however he was no longer in parliament, having lost his seat for Lincoln at the election of 1841. As was natural, the rich baronet of Knebworth felt this exclusion more than the comparatively poor author could have done; and accordingly, while plying his pen busily in the production of the two last-mentioned of the above novels (both of them written after his accession to the Knebworth property), he was again directing his attention towards active politics. Change in the circumstances of the country co-operating with inner and outer changes more immediately affecting himself, had so modified his views in politics, that it was as a Conservative, or Protectionist, that he now sought to return to parliament. In 1847 he was again an unsuccessful candidate for Lincoln; and it was not till July 1852 that (having in the previous year explained his Protectionist views in 'A Letter to John Bull, Esq., on Affairs connected with his Landed Property and the Persons who Live Thereon') he re-entered the House of Commons as member for the county of Herts. He still represents this county in parliament, and has of late taken a leading part in the debates of the house and in the councils of his party, auguring his elevation to a high place in the administration, should events bring that party again into power. His political opinions and position are thus briefly indicated in the 'Parliamentary Companion' for 1855:—"Concurs in the general policy espoused by Lord Derby; would 'readjust' the income-tax, and 'mitigate' the duties on malt, tea, and soap; 'some years ago advocated the ballot, but, seeing its utter inefficacy in France and America, can no longer defend that theory;' will support education on a religious basis, and vote for a repeal of the Maynooth grant."

Among Sir Edward Lytton's more recent writings, in addition to the 'Caxtons' and 'My Novel,' may be mentioned 'The Confessions of a Water-Patient, in a letter to W. H. Ainsworth, Esq.,' published in 1845, when the author, having received a wonderful renovation of his own health at a water-cure establishment, desired to recommend the same therapeutic treatment to others, and especially to men of letters, whose constitutions might be shattered by over-work. Another recent work of a different nature is 'Not so bad as we seem, or many Sides to a Question,' a five-act comedy, originally written for the benefit of the Guild of Literature and Art. The play was acted in London and in various British towns by amateur actors, under the management of Mr. Dickens; and since its publication in 1852, it has been acted on the regular stage. Besides the proceeds of this play, the Guild has received from Sir Edward an additional gift in the shape of a piece of land, as a site for a projected hospital for decayed and aged artists and literary men. In 1852 Sir Edward delivered a lecture to the Royston Mechanics Institution, published with the title of 'Outlines of the Early History of the East;' and in 1854, having been elected first honorary president of the associated societies of the University of Edinburgh, he visited Edinburgh, and delivered an 'Inaugural Address' to the students, which has also been published. At the very moment of our writing this notice (December 1856) another Scottish University—that of Glasgow—has conferred on him a similar honour, by electing him its lord rector; in which office he succeeds a splendid list of predecessors.

In a retrospect of Sir Edward Bulwer Lytton's career, the first thing that strikes one is his prodigious industry and voluminousness as an author. He is yet only in his fifty-second year, and has seen fourteen years of active parliamentary life, and yet he has given to the world upwards of forty distinct works, most of them originally in three volumes. No poor author labouring incessantly for subsistence could have worked harder than this man of patrician descent, born the heir to a large fortune. Next, what strikes one is the great versatility of talent displayed amid all this quantity of work. Besides novels of all orders—the historical, the sentimental, the fashionable, the domestic, the romantic, and the mysterious—we have dramas, non-dramatic poems, translations, essays, historical disquisitions, political pamphlets, and lectures and speeches. The author may not have attained equal success in all these kinds of literature, nor in those in which he has succeeded best—prose-fiction and the drama—may he have satisfied the preconceptions of some critics as to the highest possibilities of matter and art in these departments; but the fact of such varied and brilliant accomplishments, such breadth of achieved success, would alone entitle the author to his distinguished place in English literature.

And thus it is that, while among the most popular authors in Britain since Scott, he is perhaps of recent English authors the one whose works are best known on the Continent. His novels are read in translations not only in France, Germany, &c., but in the remote parts of Hungary. In America he is as popular as with us; and this, though Emerson, repeating a charge also made amongst ourselves, has said of him that he "is distinguished for his reverence of intellect as a temporality, and appeals to the worldly ambition of the student"—in which however according to the same critic, he but shares a spirit inherent in most English literature.

In 1827, Sir Edward, then Mr. Bulwer, married Rosina, only surviving daughter of Francis Wheeler, Esq., of Lizard-Connell, Limerick, Ire-

land. This lady has also led a literary career, being the authoress of the following novels—'Chevely, or the Man of Honour' (1839); 'The Budget of the Bubble Family' (1840); 'Bianca Capello,' a historical romance (1842); 'Memoirs of a Muscovite,' a story of modern Italian life (1844); and 'The Peer's Daughters,' 'Behind the Scenes,' and 'The School for Husbands, or the Life and Times of Molière.' Of two children of Sir Edward and Lady Bulwer Lytton, one, a daughter, died in early youth; the other, a son and the heir to his father's estate, was attached to the British embassy at Florence, and has recently (1856) proved the inheritance of literary genius, by a volume entitled 'Clytemnestra, the Earl's Daughter, and other Poems,' which was warmly received by the critics.

END OF VOLUME III.

THE following is a list of the names of persons who have died since the publication of the 'Penny Cyclopædia,' and of "those living names" which, in accordance with the announcement in the Prospectus, are included in the third volume of the Biographical Division of the 'English Cyclopædia.' The asterisk is prefixed to names of living persons:—
